We find as a rule, that those who excel—those who make rapid strides in ascending the rugged steep of science, and accomplish great works, are among those who possess much of this noble characteristic. It is true, that the man who is ever in season in fulfilling his obligations and duties in the many relations of life, will have the confidence of all the people who have formed his acquaintance, and this secures to him a treasure in itself; besides he saves time, anxiety, and unnecessary expense, naturally incurred by indifference and laxness.

There is economy in being prompt—in being in season in our business transactions. Peculiarly, we economize, and not only so, but we cancel many of the perplexities of life, so wearing upon human nature, and antagonistic to harmony and happiness. When we fail to be punctual—when we neglect to fulfill to the letter our promises and agreements—then we most certainly fail to fulfill the great moral command, "Do unto others, etc." Who thinks of this? Who realizes that this is indeed a moral wrong? and that he who violates the moral law, most certainly brings upon himself the

disgrace—the penalty. Can we claim the title of moralist, and still continue to be careless and negligent in our most important duties? Let him who thus thinks, grovel on, bear the inevitable consequences, and become wise by experience.

It is too true that the manifestations that should come from the people, indicating this trait of character to be strong and vigorous, have but little power as an example to reform the young. Parents, if you would begin the work of revolutionizing society—of inculcating great moral principles, make yourselves examples such as you would that your children should be. If you would teach your children morals, begin by being yourself in season in every duty, for your acts far surpass your precepts, in making impressions upon the minds of your little ones. We should see to it that we have exemplary teachers in our schools, in this respect. This is absolutely necessary, for scholars have much confidence in their teachers and will, in a measure, become what their teachers are, from example. If we have teachers to govern and instruct our children who are drowsy and loose in their mode of life, what more can we expect, than that our children will partake of their natures in customs and habits. Therefore, practice and precept in our homes, and in our schools, should be such as we would be proud to sanction in the characters of those we love.

The great responsibility of leading and influencing mind in that direction, which will ultimately result in the good and well being of the possessor, and tell upon the happiness of the world sooner or later, rests with the instructors of the youth—as are their precepts and corresponding examples, so is the happiness and harmony in society. The great beginning of this work is to be punctual in all our transactions, thereby impressing the great lesson upon the minds of the young, and in this manner, begin the work of moral as well as business reform.

Palmyra, Wis., 1859.

Written for Moore's Rural New-Yorker.
THE PROPER IMPROVEMENT OF OUR TIME.

The proper improvement of our time should claim our earnest attention. When we see hundreds around us squandering the time allotted to them, which should be used in the improvement of their mental faculties, we should be led to inquire, for what purpose do we exist? for what end have we been created? The time which our benevolent Creator has given us, should not be lost in idleness. God, in creating us, did not intend us to be mere nothings in society, but He created us with a wise purpose in view—to do good to our fellow-men around us. If we do not improve the time given us, then we disobey the direct command of our Creator, for the Scriptures say, "Whatsoever thy hand findeth to do, do with all might." Besides, we have the examples of distinguished men who have, by their own exertions, raised themselves from ignorance and poverty to the highest pinnacle of fame. De Witt, while laboring at the mill, with the open book before him, is a strong illustration of what an unyielding perseverance, and stern resolution may do towards raising us from a common level, to the highest station in our land.

Assyria, Mich., 1859.

READING AND DEFINITION.

I do not propose to speak of rhetorical excellence in reading, but of the importance of being able to do it with correctness and fluency. A child should be able to read mechanically well, before he is required to recite a lesson learned from a book. I believe every child can become a fluent and correct reader; and the importance of it grows out of the fact that most of our knowledge is gathered from books. Before the art of printing was known, those who desired to add to their stock of knowledge, were obliged to travel from city to city, and from one country to another, to converse with those who knew what they did not. This was a long and expensive method of acquiring knowledge. Now we can remain at home, and learn from books all that is known on any given subject.

But the boys and the girls that read hesitatingly, do not read much. They never undertake to read a volume through, because it is a slow and tedious process. They may as well not read at all, as not read with readiness and care. I speak of this because I find that many children pass through the common school course without being able to read mechanically well.

It is quite important that they never miscall, or mistake one word for another which resembles it in appearance; as *conduct* for *conduct*, or *truth* for *truth*. I frequently hear mistakes in recitations which were occasioned by thus mistaking the word. But of what use is it to read fluently and correctly, if we know not the meaning of the words? We shall either get no idea, or a wrong one. It by no means follows that we understand a sentence which we pronounce fluently.

Special pains should be taken to teach children the meaning of words. Some attention should be given to it in every recitation. It is not enough to refer the scholar to the dictionary; the definition there given is general, and does not meet the wants of the child. If he can be shown the thing defined, nothing more is necessary. But this cannot always be done. It is useful to explain the difference between one word and others that resemble it; as between *meat* and *flesh*, *lie* and *lay*, *single* and *singular*, *freedom* and *liberty*, etc. It is a very useful discipline for children to be able to point out the difference of allied words and things. It cultivates a habit of observation and discrimination; as, what is the difference between *stationary* and *stationary*, or a ship and a sloop, or patience and hope. I trust every teacher who may read this, will do all he can to make his pupils fluent and intelligent readers.—E. D., in *Massachusetts Teacher*.

Very touching and beautiful were the words of the old schoolmaster, as life passed away. "It is growing dark—the school may be dismissed."—Down to the very gates of an unseen world he carried his love and regard for the children whom he had trained.

LEARNING makes a man fit company for himself.

"PASS THE PEPPER."

Or all the aromatics which are partaken of by man as flavors to his food, there is none more common than pepper. The three important peppers commonly found on the dinner tables, are white, black, and cayenne, all natives of the tropics. They are much used (to stimulate digestion) by their human brethren—those hot and choleric old nabobs who confer a benefit on the world by living in hot climates, far removed from the haunts of civilized life. Thus the "chow-chows," "curries," and other dishes so relished by your yellow-faced East and West Indians, owe their flavor and pungency to the amount of pepper they contain.

There is one variety of the genus *Piper* to which the white and black peppers belong. (cayenne being a member of the genus *Capsicum*—called so, by the bye, from a Greek word which signifies to bite;) which variety is a great favorite with housekeepers and cooks, and has received from them the flattering name of "allspices," as it combines in itself the flavors of cloves, nutmeg, and cinnamon. It grows plentifully in Jamaica and other American islands, where it was first discovered by the Spaniards, who gave it the name of *Pimento de Jamaica*. The French call it the "round clove."

Black pepper is cultivated in large quantities in Malacca, Java, and especially at Sumatra, the trade of those places being almost exclusively in these spices. A pepper garden during the ripening of the pod is a lovely sight, being a large plot marked out into regular squares of six feet, in each of which are planted young trees, called *chintarens*, that serve as props to the pepper vines. When the prop has reached twelve feet high, it is cut off and the vines planted, two to each prop. A vine is three years in coming to maturity, and the fruit, which grows in long spikes, is three or four months in ripening. The berries are plucked as soon as ripe, and spread on mats upon the ground to dry, by which process they become black and shriveled and are imported here as black pepper. In this city, and distributed throughout the States, are many mills where pepper is ground, and we are sorry to say, it is often sophisticated with burnt crusts of bread and other adulterations.

The Sumatrans once did a Yankee trick in connection with pepper, which is worth recording.—They steeped the pepper corns in water until the shells, or outer coat burst, and then drying them without it, sold for three times the price of the black, as a different species, to the East India Company, who then monopolized the pepper trade. The company, having swallowed the story, made the buyers swallow it, too, and ever since we have had the two peppers, white and black, both coming from the same plant, but one possessing its coat, and the other being deprived of that useful appendage, and so weakened in its pungency.

Cayenne was first noticed on the coast of Guinea, and has been generally used by the natives of those climates in which it grows as a strengthener for the stomach. It is an extraordinary fact, but still true, that although savages may be unacquainted with the polite arts, they are generally well informed upon the subject of gastronomy, and to suit their sometimes peculiar tastes, they generally discover all the edible good things which their native soil affords. It cannot be denied that hunger and the palate are great equalizers, and the stomach, much as we abhor gluttony, does much for civilization; in fact, his stomach and its wants distinguish man from the brutes, for, as Dr. Kitchner correctly observed, "Man is the only cooking animal."

The cayenne of commerce is the grain or seed of the capsicum, ground and mixed with flour and then baked into little cakes in an oven; these are again broken up and mixed with more flour and placed in jars for sale. The tree or plant is very beautiful, and forms a great ornament to a garden, but it is very tender and requires much care. It is more pungent than either white or black peppers, and is often adulterated with logwood and mahogany, eawdust, and red lead; this latter can, however, be easily detected by placing a spoonful carefully in a glass of water, when, should it contain any red lead, it will, from its specific gravity, quickly drop to the bottom, while the cayenne will sink but slowly. A very pleasant drink may be made for cold nights, and one that is healthy, too, from pepper. Here is the recipe:—Place three or four lumps of sugar, with half a teaspoonful of pepper, in a tumbler, and fill up with hot water; when the sugar is dissolved, drink. It is not only pleasant to the palate, but warms the whole body more effectually and quicker than any spirits.—Those of our readers who try our recipe once, will often, during the winter, when the fire burns low, and they feel chilly, generally exclaim in the language of our caption, "Pass the pepper."—Sci. American.

AIR.—Air is an exhalation of all the minerals of the globe; the most elaborately finished of all the works of the Creator—the rock of the ages disintegrated and fitted up for the life of man. All classes of men affirm this. Sidney Smith says to public speakers, that if they would walk twelve miles before speaking, they would never break down. In English Universities, boat races, horse-back rides, and ten mile walks are a part of the educational means for physical development. Plato says a walk in the open air will almost cure a guilty conscience.

CALMNESS UNDER PROVOCATION.—Socrates having received a blow upon the head, observed, "That it would be well if people knew when to put on a helmet." On another occasion, being attacked with opprobrious language, he calmly observed, "That man has not been taught to speak respectfully." Many Christians might learn from this heathen.

FERTILITY OF THE HOLY LAND.

No country of equal size, probably, contains greater inequalities of surface than Palestine—varying from the peaks of Lebanon, 10,000 feet above the sea level, to the plain of Jericho, 1,300 feet below it. Hence the Holy Land afforded almost every variety of vegetable productions; and when in its glory, populous and cultivated, and enjoying the smiles of Jehovah, it was not unworthy of the glowing rhapsody of Dr. Hamilton, the emphatic terms of which are almost all from the Bible:

"A better country than this, earth did not contain. It was 'a delightful herbage of the host of nations.' It was variegated and intersected with all the elements of sublimity and beauty—with whatever was bold and gentle. It was a wealthy place. Aromatic herbs covered its hills, and the fairest flowers decked its gleits. The rose was in Sharon, and the lily in the valleys. The voice of the turtle was heard in the land. There roamed the vine, and there clustered the date. And there hung the pomegranate. The cedar towered on the mountain, and the myrtle skirted their sides. No human hand could raise the clusters of Eschol. The south winds passed over the gardens, causing the spices thereof to flow out. The seasons revolved in their variety, but with a blended sweetness. There was the upland breeze, in which the fir could wave its arms, and the softer air, in which the olive unfolded its blossom. The sun smote not by day, nor the moon by night. The birds sang among the branches. There was balm in Gilead. The fig-aloe drooped from the river bank. Lakes glistened in the landscape, and cooled the drouth. Beautiful for situation was Mount Zion. The cattle browsed on a thousand hills. The excellence of Carmel and the glory of Lebanon set their pinnacles against the deep azure of Canaan's sky. The barns were filled with plenty—the vineyards distilled the pure blood of the grape. The fountain of Jacob was upon a land of corn and wine. The granaries were filled with the finest wheat. It flowed with milk and honey. Its heavens dropped fatness. At stated periods fell the early and latter rain. The land might be called *Eulalia*. The distant glimpse of its prospects refreshed the dying eye of Moses: and of all thine earthly territory this is emphatically thy land, O, Immanuel."

This flowery description by no means applies to Palestine as it now is. Depopulated, neglected, misgoverned, it has become as desolate as it once was beautiful and fertile; and testified to the truth of God's word, "Woe be unto them when I depart from them."

ECHOES.

The ear cannot distinguish one sound from another, unless there is an interval of one-ninth of a second between the arrival of the two sounds.—Sounds must, therefore, succeed each other at an interval of one-ninth of a second in order to be heard distinctly. Now, the velocity of sound being eleven hundred and twenty feet a second, in one-ninth of a second the sound would travel one hundred and twenty-four feet.

Repeated echoes happen when two obstacles are placed opposite to one another, as parallel walls, for example, which reflect the sound successively.

At Admath, in Bohemia, there is an echo which repeats seven syllables three times. At Woodstock, in England, there is one which repeats a sound seventeen times during the day, and twenty times during the night. An echo in the villa Smaionetta, near Milan, is said to repeat a sharp sound some thirty times audibly. The most celebrated echo among the ancients, was that of the Metelli, at Rome, which, according to tradition, was capable of repeating the first line of the *Aeneid*, containing fifteen syllables, eight times distinctly.

Dr. Birch describes an echo at Roseheath, Argyleshire, which, it is said, does not now exist. When eight or ten notes were played upon a trumpet, they were returned by this echo upon a key a third lower than the original notes, and shortly after upon a key still lower. Dr. Pogo describes an echo in Fairfax county, Virginia, which possesses a similar curious property. This echo gives three distinct reflections, the second much the most distinct.—Twenty notes played upon a flute are returned with perfect clearness. But the most singular property of this echo is, that some notes in the scale are not returned in their places, but are supplied with notes which are either thirds, fifths, or octaves.

There is a surprising echo between two barns, at Belvidere, Allegany county, N. Y. The echo repeats eleven times a word of one, two, or three syllables; it has been heard to repeat thirteen times. By placing oneself in the centre between the two barns, there will be a double echo, one in the direction of each barn, and a monosyllable will be repeated twenty-two times.

A striking and beautiful effect of echo is produced in certain localities by the Swiss mountaineers, who contrive to sing their *Rans des Vaches* in such time that the reflected notes form an agreeable accompaniment to the air itself.

The Killarney notes are quite famous, and renowned with marvellous clearness to the notes of a bugle, as the traveler rows from point to point in the beautiful lake.—Prof. Silliman.

WELL AND SPRING CLEANING.—As spring is approaching, we earnestly advise all persons who use well water and spring water to have both wells and springs thoroughly cleaned out, and then washed out in early May and also during October, as there is strong reason to believe that the settlements which have accumulated, including decayed vegetation, impart their disease-engendering qualities to the water, and thus originate some of the most dangerous forms of low or typhoid fever at a time of the year when the weather is so cool as to preclude the idea of their arising from vegetable decomposition. The stench of the debris at the bottom of wells should induce all cleanly persons to expurgate them thoroughly, aside from considerations of health.—Holt's Journal of Health.

ELOQUENCE consists in feeling a truth yourself, and making those who hear you feel it too.

THE PEOPLE'S COLLEGE.

The following note we have received from a young man anxious to obtain a good English education:

Eds. RURAL:—My object in writing to you is to know if you can tell me of a school that I could attend for two or three years, in which I could work enough to pay my way? I wish to attend school about that length of time, but am unable to do so, unless I work out long enough to procure means to attend school one term, and then work again for more funds, which would take a long time to finish an education, and I would spend the best part of my life before I could reap any benefits from my labors. Do you know of a school in which I can work enough at something to pay my way? I can do the work of a man. If I could sell myself, or be put under some binding obligations to some one that would help me to school, and be at their service to act in any capacity for them, or for which they might receive the profits until they were well paid for their trouble, I would be willing to perform faithfully all that devolved upon me to do. Will you please give me some information or advice as to what I ought to do in order to obtain a good English education? Do they calculate to give a student a chance to work his way through *The People's College*? When will they be ready to receive students? Will you please condescend enough to reply?—E. LITTEBRANT, Ft. Edward, N. Y., 1859.

The *People's College*, at Havana, N. Y., if we understand its design, is intended to meet just such cases as this, and we know of no other to which we can refer the inquirer. When it will be ready to receive students, we cannot say. Will not some of the officers give us the facts? The following in regard to its objects, etc., we take from the *Cincinnati*:

"The name, as used by the founders of the College, intends nothing boastful or reproachful; it is meant to suggest only, what most reflecting persons concede, that some modification of the prevailing systems of College education in this country is demanded to enable them better to subserve the wants of the people. The title is intended to be significant, 1st, because it is expected that the College will, on pecuniary grounds, be more easily accessible to young persons seeking an education than most institutions of similar grade; and 2d, because, while the discipline of the mind and institutions in the sciences and letters will be here properly cared for, the application of the sciences to the arts will be particularly attended to; thus making the College both a disciplinary and professional institution.

This College was chartered by the Legislature of New York, in April, 1853, and there were conferred upon it the immunities and privileges common to the colleges of the country. It is provided, however, in the charter, that the diplomas, or honorary testimonials conferred on students, shall expressly specify the branches which the student has mastered, and those only. Its capital stock consists of \$250,000, and may be increased to \$300,000. Its declared objects are:

1. To so arrange the exercises of students as to qualify them, upon graduation, to enter at once upon the business of their choice, by giving not only a theoretic, but a full, systematic, practical course of instruction, illustrative of the principles and laws upon which their business is based and should be conducted.

2. To elevate labor, by requiring each student to work upon the farm, or in the shop, a portion of five days in a week.

3. To afford adults opportunities of pursuing any favorite branch of study.

In subservience to these designs, students are to be required to master text-books on Geology, Botany, Chemistry, Entomology, Anatomy, Physiology, and Natural Sciences generally; on Architecture, Engineering, Bridging, Road-making, Agriculture, Gardening, etc.

Courses of lectures are to be given, which not only the inmates of the College may attend, but the farmer, mechanic, or day laborer, defraying the expenses of such attendance, if he choose, by working upon the farm or in the shops.

4. The farm and workshops are to be models of imitation, to the end, that visitors from a distance, as well as the inhabitants adjacent, may receive useful hints in respect to their various avocations.

It is intended, also, that here may be seen and procured the finest specimens of mechanism, the choicest varieties of fruits, grapes, roots, etc., adapted to this climate, with the information essential to their culture; the best machines and implements adapted to mechanical and agricultural industry, with a full and particular description of their uses. The College Farm, which consists of two hundred acres of land of variegated soil, has been secured to the College by deed, and shops, with their implements, are soon to be provided.

The work on the College edifice was begun September 8, 1857.

The foundations and basement story have cost about \$12,000.

The house is arranged for a chapel of a size to seat 1,800 persons, for ten lecture rooms, 47 rooms for the President, Professors, Secretary, and Treasurer, and 220 chambers for students, each to accommodate two persons. It will also contain a culinary department, and suitable rooms for the steward. It will be thoroughly ventilated and heated by furnaces. Its estimated cost is \$175,000.

In respect, now, to the importance of this College enterprise, there will not, probably, be much difference in opinion. The wisdom of the means by which it is proposed to achieve the undertaking, must be left, in some measure, to the test of experience. They will be criticised, and the friends of the institution have the right only to insist that the subject be candidly canvassed."

THE FOUNDATION OF CHARACTER.—Integrity is the foundation of all that is high in character among mankind; other qualities may add splendor, but if this essential requisite be wanting all their lustre fades.

— Mexico had seven Presidents in the month of January.

— The new State of Oregon contains 8165,000 square miles.

— In Chicago, 18,000 lots are advertised for non-payment of taxes.

— There is said to be a weed in Canada that produces a sort of cotton.

— A library is now opened in Boston, expressly for the use of ladies.

— It is said that six new churches are to be built in Boston this season.

— Great preparations are being made on the seaboard for mackerel catching.

— The sufferers by the Princess explosion are daily dying of their injuries.

— Ericsson's *Caloric Engines* are now manufactured for mechanical purposes.

— The unclaimed dividends in the Bank of England amount to over five million.

— Strawberries and asparagus have been brought to New York from the South.

— Letters from Havana, dated the 9th, mention the presence of Fillibuster Walker.

— It is said that Gen. Cass' health is so infirm that his death at any time would be no surprise.

— A bill to prohibit the marriage of white with black persons has passed the Wisconsin Legislature.

— The first of the season, the man with white pantaloons, has appeared in the streets in Baltimore.

— The Queen's theatre in London is about to be transformed into a large hotel on the American plan.

— The Christy Minstrels are performing in Paris, where they are called the *Bouffes Americains*!

— The Western Lakes are all open, and navigation upon them has fairly commenced for the season.

— Sherman Crowell, Esq., late editor of the *Albany Argus*, died on Friday at New Haven, aged 66 years.

— It is stated, for the information of husbands and papas, that there are seven different styles of skirts.

— A man by the name of Twitchell died at Bloomfield, Ohio, a few days since, who weighed 386 pounds.

— Over \$7,000 have already been received at a fair in Boston, held to raise money for a Homeopathic hospital.

— During the year of 1853 there were carried over the New York city railroads thirty-five million persons.

— Gideon B. Smith, of Baltimore, the locust man, predicts invasion by that insect of several Southern States.

— There are four sisters in Taunton, Mass., whose united weight is 995 pounds, the youngest weighing 256 pounds.

— A couple in Portland, Me., celebrated their "tin" wedding last week, on the tenth anniversary of their marriage.

— The railroad bridge at Middlebury, Vt., together with four cars, was destroyed by fire on Thursday morning week.

— A Utah correspondent says Heber Kimball and Brigham Young have harems that cover each an acre of ground.

— It is stated that the Russian war, for single a year, cost over \$250,000,000; no small amount spent in shooting people.

— The Richmond Whig announces that free white labor is now employed in the Virginia factories to put out tobacco.

— The New York Central Park is expected to be completed some time in 1860. Its total cost is estimated at \$2,225,000.

— The French army, it is said, is composed of 621,000 fighting men, of which over 500,000 are available for foreign war.

— A revival of great power is in progress in Rye, N. H. One hundred and fifty persons are stated to have been converted.

— The latest sensations in New York are Bonner hats, asparagus and green peas, and French theatricals on Sunday evenings.

— Southern papers concur in the statement that vegetation in that latitude is at least one month in advance of ordinary years.

— Walker, Henningsen, and other Fillibusters, are reported to be organizing at San Antonio, Texas, for a march into Sonora.

— Fine trout fishing up Lake Superior way; four hundred two pounders were killed by an angler in one day, near Marquette.

— A little girl and several dogs have been bitten by a mad dog in Lowell, Mass., and excitement prevails here on the subject.

— The Empire machine company of Norfolk, Conn., as contracted for building 5,000 sewing machines for a few New York company.

— The circulation of the banks throughout the Union, the year 1854, was \$103,330,000, against \$165,000,000 the previous year.

— The number of miles of railroad now open in Texas, 1853; besides which there are 113 miles more graded, and 41 under contract.

— The professional juror's occupation is gone in Illinois, as by law no person is allowed to serve more than once a year upon a jury.

— At the ball given by the Americans in Paris, on Feb. 22d, one of the ladies is said to have worn lace to the value of \$0,000,000.

— The total real and personal estate of Hartford, Conn., valued at \$21,612,400, among which are 2,550 dwelling houses, valued at \$7,500,250.

— A singular work is in preparation abroad. It consists of a book of parodies on all manner of living poets, to be called "Ivial Ithyness."

— Four persons were drowned off Port Darlington, Canada, on the 13th inst.—two men, a woman and child. The boat was capsized in a gale.

— The number of letters which passed through the Post-Office of Great Britain, the past year, was five hundred and twenty-three million.

— The *Williamette* (Conn.) Journal says a trout was caught in that vicinity a few days since which weighed pounds. A very baby story.

— Forty citizens of Waterville, in Litchfield, Conn., are formed a joint stock company, with \$10,000 capital, the manufacture of penknives.

— The age of the great California tree, estimated by count of the annual layers of wood, is 6,403 years, somewhat older than the human race.

— The Canal Board have reduced the canal tolls, for present year, on beer, cider, vinegar, rye, peas, and rags, from three to two mills.

— The town of Hooksett, N. J., has voted to discontinue its liquor agency, April 1st, and divide the liquor stand equally among the legal voters.

TWO DOLLARS A YEAR.]

"PROGRESS AND IMPROVEMENT."

[SINGLE NO. FOUR CENTS.]

VOL. X. NO. 14.]

ROCHESTER, N. Y.,—FOR THE WEEK ENDING SATURDAY, APRIL 2, 1859.

[WHOLE NO. 482.]

MOORE'S RURAL NEW-YORKER,
AN ORIGINAL WEEKLY
RURAL, LITERARY AND FAMILY NEWSPAPER.

CONDUCTED BY D. D. T. MOORE,
With an Able Corps of Assistants and Contributors.

TERMS IN ADVANCE

TWO DOLLARS A YEAR—\$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for \$5; Six and one free to club agent, for \$10; Ten, and one free, for \$15; Fifteen, and one free, for \$22; Twenty, and one free, for \$30; Thirty-two, and two free, for \$40; (or Thirty for \$37.50,) and any greater number at same rate—only \$1.25 per copy—with an extra copy for every Ten Subscribers over Thirty. Club papers sent to different Post-offices, if desired. As we pre-pay American postage on papers sent to the British Provinces, our Canadian agents and friends must add 12½ cents per copy to the club rates of the RURAL. The lowest price of copies sent to Europe, &c., is \$2.50—including postage.

THE POSTAGE ON THE RURAL is only 3¼ cents per quarter to any part of this State, and 5¼ cts. to any other State, if paid quarterly in advance at the post-office where received.

All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

INQUIRIES AND NOTES.

Grubs in the Head of Sheep, &c.

Will you, or some of your numerous correspondents, form me through the columns of the RURAL if there is a remedy for grubs in the head of sheep? If there be one, I would like to hear of it. Also, which is the best book in the United States treating on Diseases of Cattle, and where can it be procured?—E. Cook, Clarendon, Vt., 1859.

The "grub," so called, is the larva of the *Exorista ovis*, or gadfly. This fly is led by instinct to deposit its eggs in the nostrils of the sheep, which are immediately hatched by the warmth and moisture of the parts, and the young grubs creep up the nose, finding their way to the sinuses, where they attach themselves to the mucous membrane lining those cavities. The presence of the grub does not constitute disease, but it may be well enough to diminish their numbers. One mode of effecting this object is to plow up a furrow or two in the sheep pasture. Another, is to smear the noses of sheep with tar, which, it is supposed, the fly is not fond of, compelling it to seek some other place to deposit its eggs and carry out its desires for procreation. When the grub has taken possession it is dislodged by injecting tobacco smoke in the nostrils, the use of turpentine, &c. To the second query of our correspondent we can only say there are two works (convenient in form, and low in price,) before the American people—"Youatt on the Diseases of Cattle," and the "American Cattle Doctor" by Dr. DADD. Either, or both, of the above will never be out of place in a farmer's library. The price of the former is \$1.25, of the latter \$1.00, and may be procured at most of the bookstores through the country.

Broom Corn.

I wish to gain some information in regard to the raising of Broom Corn. First, what is the best kind of soil, and when is the proper time to plant, and what distance apart? Which is the best kind, large or small? At what stage should it be harvested, and what is the proper way for curing, and what is a common yield per acre?—A. SCHUBERT, Onond. Co., N. Y., 1859.

The best soil for broom corn seems to be the alluvial flats, like those along the Mohawk river, and the Genesee, though it can be grown on any good corn land. Plant at the same time as Indian corn, either in hills, three and a half feet apart, with eight or ten plants to the hill, or in rows, the same distance, and the plants in the row five or six inches apart. Some good cultivators think the brush is finer and straighter when grown in rows, or when the corn stands pretty thick in the hills. Cultivate the same as for corn, until the seed is formed and begins to ripen, then break the stalks some 12 to 18 inches below the brush, and bend the tops of two rows towards and across each other. This is called *tabling*, which hastens the ripening, and is convenient for cutting. After remaining in this condition ten or twelve days, cut off the heads or brush, leaving about seven inches of stem attached. It can then remain *tabled* for a few days or be removed and spread out on the barn floor. Those who raise large quantities generally provide racks for drying, and we have often seen it suspended by cords. As soon as properly cured the brush is cleaned of seed by passing it through a kind of *hatchel*. A machine for this purpose is manufactured, and used by all large growers. The average yield is *two* or six hundred pounds of brush

to the acre. Who, with experience, will state the best variety? We have another inquiry asking whether broom corn can be profitably grown on the Western prairies, and fortunately we have a communication from a Western reader, directly to the point—as follows:

CULTURE OF BROOM CORN IN ILLINOIS.

Broom Corn can be profitably grown on the prairies wherever a market or convenient shipping port offers, in two ways—either as a *sod* or *first crop after breaking*, or in *rotation* with wheat, corn, &c. Its cultivation is well adapted to this soil—it makes a fine growth, and is worthy of attention at the hands of Western farmers.

Broom Corn, when grown on the "breaking," should be in the ground by the first of June.—While breaking it should be planted with a seed-drill or dropped by hand in the furrow, and the next slice turned upon it. The rows should be as often as once in every other furrow, when the "big breaker" is used, but with a "two-horse breaker" once in three furrows. The plants will manage to get up through or around the sod, which should be rolled with a heavy roller, but it seldom is done. The yield of brush on sod will average about 400 pounds per acre, and as it receives no care after planting until harvest, it is quite remunerative.

Its cultivation on *old ground* requires labor and care. Plow deep and well, and harrow until the whole surface is finely pulverized. Plant from the 20th of May to the 1st of June—rows three feet apart in drills, or hills about one-and-a-half feet apart in the row. Cultivate well as soon as large enough, or as soon as you can see the row. Hoe and thin out, when four to six inches high, to an average of 18 stalks to two feet. Continue to keep the soil clean and mellow by cultivation throughout its growth.

The crop should be harvested green to make the best brush,—at least be sure to have it all gathered before the earliest frost. Fair, sunny weather should be chosen for cutting off the brush, so that it may lie in the sun for a couple of days to cure, after which it should be spread on poles in an open shed or loft to dry, and be watched closely to see that it does not heat. An average yield is from six to eight hundred pounds per acre. Like all other crops, the profit is in proportion to the price in market. It gave last summer (1858) a clear profit over and above cultivation, of \$12 to \$18 per acre, and it is the opinion of Mr. J. L. DOUGLASS, who has had much experience with it, that it will average from \$18 to \$20 per acre when well cultivated. The cost of cultivation and preparation for market will average about \$10 per acre.

Some growers have their crops manufactured, and dispose of it to the country merchants. This plan can be quite universally adopted by farmers throughout the West, as labor is abundant and cheap in winter, the proper season for manufacturing brooms.

We have seen several varieties of broom corn, and wish to know the name of the best kind, and where obtained. Is the Arkansas variety the best?—W. H. GARDNER, Amboy, Lee Co. Ill.

When to Sow Canary Seed.

I should like to inquire, through the columns of the RURAL, how, and at what time, to sow Canary Seed? A year ago last summer I planted some in hills about the middle of June, but it did not get ripe.—O. H., Schuyler, N. Y., 1859.

The culture of Canary Seed by the American farmer must, for a year or two, be looked upon in the light of an experiment. We have strong faith that it will mature in this latitude, and the comparatively minute tests that have been made in this vicinity, and which have come under our observation, fully confirm the belief. This cereal, should it be grown successfully, would take its natural position among our *spring crops*—would sow at same time as for barley. It is generally cultivated in drills. In England, where considerable dependence is placed upon the hoe, (an implement the worth of which is better appreciated abroad than with us,) the drills are set ten inches apart, and the land kept free from weeds. The ground should be in readiness as early as possible, the surface completely comminuted by the harrow to the depth of two or three inches, and thus a fine seed bed with firm bottom provided. We hope O. H. will give a *thorough trial*, if any, and report the result.

Plaster and Clover Seed.

I would like to know what amount of plaster is best to sow on an acre of clover? and if it is good policy to mix Timothy with clover seed when we wish to cut the crop for seed.—T. J. M., Menta, Cay. Co. N. Y.

WHAT do farmers generally consider the best quantity of Timothy or clover seed to sow to the acre?—B. F. From one to two bushels of plaster is used to the acre. Clover for seed should be sown alone. From 15 to 20 pounds of clover seed is required for an acre, and from 12 to 20 quarts of Timothy.

RURAL'S PREMIUM BARN.—No. II.

Above we give a perspective view of the Barn to which the Committee awarded the RURAL'S Second Premium, as previously announced in their report. It is located in one of the richest sections of Western New York—a portion of the Genesee Valley which has long been famous for its superior cultivation, productive soil, fine farm buildings, and the general good management and consequent prosperity of the people.

PLAN OF BASEMENT.

A, Tool Room; B, Root Cellar; C, Cistern; D, Hall; E, Horse Stable; F, Cow Stable; G, Open Shed; a, Mangers; b, Feed Box; c, Stairs.

This barn is situated in the town of Wheatland, Monroe Co., N. Y., on the farm of IRA ARMSTRONG, by whom it was built, in the year 1855. It is located upon a level piece of ground, the entire building being above the surface. The size of the structure is 45 by 60 feet.

THE BASEMENT STORY is built of stone, and is 9 feet high, with 10 stalls for cattle, and a place to throw manure out into the open apartment where

it can be preserved under cover. This open apartment, or shed as it is sometimes called, is 11 feet wide by 80 deep, and is marked G on the ground-plan. There is a large Root Cellar opening into the main hall or carriage floor, fifteen by twenty-three feet, convenient to both horse and cow stables. A blackboard on wall of carriage floor, is very convenient for writing down amount of feed, &c. The horse stable has conveniences for six horses, with a cistern of water holding some 600 barrels. All stock can be watered without going out of the barn in coldest weather of the season. The cistern is covered with red cedar, 10 inches thick; sides of cistern are stone, and plastered. There is also a large Store Room for tools and implements, large enough to house all the farm implements.

PLAN OF MAIN FLOOR.

A, Granary, with openings for passing grain below; between this and the bay is a hall. The barn floor is large, with two openings for passing hay and feed below, for use in the stables, and on the right is the large Bay, 25 by 45 feet, in which may be stored an immense amount of grain or hay.

THE MAIN FLOOR contains a Granary, large, and conveniently divided and arranged. From it are spouts leading to the Carriage Floor of basement, so that the contents of the granaries can be received into a wagon below, or used otherwise, as may be convenient. There are two large bays, a large barn floor, 14 by 45. The Stables are supplied easily through trap-doors from the main floor, as shown in the plan. The scaffolds are reached by movable ladders, which may be changed to any locality desired.

The windows of basement are supplied with pulleys, so as easily to be moved, and ventilate the entire lower floor.

THE OUTSIDE FINISH is with good matched stuff, batted to the eaves, and the gable-ends are clap-boarded. The whole is finished with three coats of white paint.

THE CARRIAGE WAY is on the south side of the building, and is made of easy grade, whilst the floor of the barn upon the south side is about 10 feet from the ground. This makes it convenient in stacking straw after threshing.

This barn is so arranged that all parts are easily accessible, and when once in the building you can get to any part with ease. There is so much room that all the crops can be housed with ease, and with little labor.

THE YARD is supplied with water from a well about 80 rods off, by a syphon.

The builder was CORNELL MARTIN, of Avon, N. Y., and the cost about \$1,500.

[We have another premium and several superior plans of Barns—such as were commended by the Committee, and others—for publication in future.]

The Water Ram.

THE inquiries and communications we have published on this subject, have induced several of our friends who have rams in use to give us their experience. We are thus enabled to lay before our readers reliable information. To bring out and spread before the world knowledge of this character, we deem to be one of the greatest missions of the agricultural press. Facts thus become generally known which otherwise would have been confined to a very few.

Messrs. Editors:—In this day's issue of the RURAL, "D. J." of Oneida Co., says he has "everything on hand" to start a Water Ram, but lacks "courage" for the enterprise. My sympathy for one whose want of "courage" compels him unnecessarily to lose the use of funds invested in materials, which, when properly placed where designed, will pay so abundantly and promptly as a water ram, prompts me to comply with the RURAL's call for facts founded upon experience in this matter.

In the spring of 1855, at a vendue, I bought a No. 3 glass air-chamber water ram for \$1, which had done service until the owner took it up as unfit for use, and put another in its place. Four hundred feet from my barn I had a valuable flow from tile, which cut off and collected the water from a springy slope of land, which was 13 ft. below the present issue in my cattle shed, and five feet above the Clyde river, into which it falls after running a few feet. I quickly saw my advantage, took "courage," repaired the leather valve of my \$1 ram, obtained half-inch pipe of the weight that proves

right, and 40 feet of inch drive pipe (all of lead.) I used two feet fall for the drive pipe, and with the help of my plow, and two men to dig, in one-half day put it in complete running order, and it has been on duty ever since, excepting when some freshets have caused the river to overflow the spring, and when that occurred the ram would work under water until the fall was reduced to about six inches from the tile to the river.

The water is elevated 15 feet above the ram, and to ascertain if it would rise higher, the pipe, when cut off at the shed was put 12 feet above the present issue, where I held it a short time in my hands and could perceive no difference in the size of the stream from that which runs from the pipe into the reservoir, although it was then 27 feet above the ram.

I cannot account for the stream not more than half filling the pipe, unless by small size of ram, or friction, or perhaps both—but six cows, six horses, and fifty sheep do not use one-fourth of it.

This pet of mine which has done me so much good service for nearly four years, with no perceptible prospect of failure for many years to come, all told, cost less than \$35.

My conclusion from observation is, that in proportion to the surplus power acquired by unnecessary inclination of drive pipe over what is required to do the desired work, will be the length of time in which the air-chamber will become filled with water, and that there should be a proper balance between the propeller and issue. This is a problem for the "professors" to solve, whether in this pro-

cess the more elastic, lighter fluid, can be forced to give place to the heavier, through the same valve and at the same instant, or why and wherefore such change does occur?

The water has been let out of my ram once in from two to three months. I have attributed this filling up to the imperfections of my old machine, but I learn it is not an uncommon occurrence, and would like to know why it is so, and how to prevent it, that the water ram may become a perpetual worker.

My yarn is already lengthy but I desire to say to "D. J.," that could he see my "happy family" of *moody-cattle*, calves, colts, and sheep, confined in one small yard, surrounded by sheds, not required to go out *this very stormy day* after water, but as they desire may step to a warm corner, under shelter, and drink from a convenient reservoir, pure flowing spring water, to their satisfaction, I think he would hesitate no longer, but take "courage" and put his "everything on hand" in working order immediately. Already by this convenience have I saved more value in fertilizing matter than the whole cost of my fixtures, which would have gone into the river had the stock been allowed to carry it there, and exchange it for the water they brought back, which is the natural process when thus watered. It is much easier to let the water out of the ram two or three times in a winter, than to face a "nor-wester" every morning, leading horses to water, cutting hole in ice, &c., &c.

It is hoped that man who pronounced the water ram a "nuisance" not long since, has had suffi-

cent time to repair, or give good reasons for his conclusion, that he may get a majority to vote it out of use, if worthless. J. W. Clyde, N. Y., March 19, 1859.

ERS. RURAL.—Information on the subject of Water Rams being called for in the RURAL, permit me to "relate my experience." For the greater part of the last five years, I have had a No. 4 Ram in successful operation. It has required a good deal of attention at times, and some repairs; but when in good order it has done its work well. It works under a fall of thirteen feet, with an inch and a half iron drive pipe, forty-eight feet long; elevates the water one hundred and forty feet above the Ram, and discharges, through seventy-five rods of one-half inch lead pipe, thirty gallons per hour.

I first put down inch and a quarter lead drive pipe, weighing but two and one half pounds per foot, which was altogether too light, and burst after working two months. I then replaced it with wrought iron gas pipe, which has lately rusted through in a few defective places, and must be renewed. For a head under ten feet I would use heavy lead drive pipe.

The discharge pipe is of the best quality of lead pipe, weighs thirteen pounds per rod, and is amply sufficient in strength to overcome the great pressure. Working under so great a head as thirteen feet, the machine is subject to considerable wear, having worn out three escape-valves. Once, the valve in the air chamber has been re-placed.

I do not consider the filling of the air chamber with water a defect, as I have had no trouble from it since I learned to make the vent the proper size. It requires to be very small, and can be made in lead pipe with a button needle, just back of the coupling with the machine. Iron pipe must be drilled with a very fine, hardened awl. A vent sufficiently large to feed the chamber with air is hardly noticeable as an impediment to the working of the machine. If too large, besides lessening the force of the stroke, the surplus air is discharged with the water and lessens the quantity raised. The vent should be made very small, then enlarged if necessary. The sound of the air chamber, after a day or two, will indicate the absence of air.

This Ram has run for nine months at a time without any attention; then, again, it has required almost daily notice, for several weeks, till in good repair again. They must be thoroughly put down, and have a thorough and ingenious owner to look after them, or else they are useless. They wear and require attention in proportion to the labor they have to perform. In the absence of other convenient means of obtaining fresh water, or for stock, the Ram will pay. For durability and main dependence, let it be the "dernier resort."—C. D. A., Gelder, N. Y., March, 1859.

Mr. Moore:—You ask for information about water rams. I have had one in successful operation for ten years, and most of the time two or three, all throwing water through the same pipe, three-eighths inch. One gives us water enough for use at the house and barn, but two or three brings it up cooler. Our spring is fifty rods from the house; fall from spring to ram six feet, and elevation 100 feet. We tried wood for drive pipe and found it admitted air through the pores and would not answer. We have used lead pipe, but it has given us some trouble by cracking; it has not sufficient strength for such a pressure. Have used iron gas pipe with perfect success. It costs from 81 to 85 cents, according to size. Ours is forty feet long, and should not be less.

There are a few difficulties that must be understood and overcome in order to success. First—there must be a small hole through the top of the drive pipe, close by the ram, to supply the air-chamber with fresh air or it will soon be exhausted, but it must be as small as it can be made with a fine cambric needle. 2d, All the rest of the air must be entirely excluded. The upper end of the drive pipe should be at least six inches under water, and the whole perfectly air-tight. 3d, The ram must be packed so as to be perfectly air-tight, both internally and externally; and 4th, The water must be pure and free from all floating matter. On these conditions our machines have furnished us with abundance of water since we closed them up last fall till the spring rains riled the water a few days since, and then we had to spend about three minutes in cleaning the sand out of the valve, since which we have not seen them. Our water comes through the house and then to the barn, and the whole trouble we have had for ten years has not been equal to drawing what water we wanted to use out of a well fifteen feet deep. —M. HURD-BARK, Kalamazoo, Mich., 1859.

MESSRS. EDS.:—Having seen several inquiries in the RURAL, relative to Hydraulic Rams, I thought that I would give you an account of one that we have in operation. Our house stands about eighty feet from the spring and 80 feet above it. We use very heavy two inch lead pipe for supply pipe, and 3/4 inch for carrying the water to the house. The Ram is one of the largest size, and running now under a head of nine feet. It has been working nine years, with only a trifling expense for repairs.

The only trouble that we experience, is with the valve for carrying off the waste water. This will not stand the jarring consequent on such a head of water more than four years, at the outside. But, as we can get them cast and turned at almost any foundry, by furnishing a pattern, this is not a very serious defect. The whole expense of setting ours in operation was \$1.

I apprehend that the reason why so many are disappointed in the working of their Rams is, first, a lack of water, second, too little fall, and third, using too light materials. —L. H. CARR, Salisbury, March, 1859.

A CURE FOR SCRATCHES.—In a recent issue of the RURAL I notice an inquiry for a reliable remedy for scratches. Common scratches (not grease) can easily be cured by from two to five daily applications of healthy human excrement, applied immediately after a thorough cleansing with Castile soap and warm water. I have never known this remedy to fail and it will be new to your readers I am happy to have the privilege of communicating it. —G. D. BAKER, Rochester, Andover Co., Me.

DEEP AND FALL PLOWING.—OBJECTIONS.

According to certain prominent writers for the Agricultural Press, deep plowing and subsoiling would seem to be almost the only essentials to a good system of farming. "Old, worn-out lands" are to be rejuvenated, and made to produce abundant crops, by simply turning over two or three more inches of soil. "Merely skimming the surface," as shallow tillage is called, is either ridiculed or denounced, and the farmer who practices it is tauntingly reminded that his "farm extends to the center of the earth." And yet, in practice, we often see the farmer, who inverts only the small portion of his farm which lies near the surface, reaping larger crops and with more profit than his neighbor who inverts his farm good way down towards "the center." The hard subsoil, miring in winter and baking in summer, is not, after all, just the right food for the young plants. He finds too late that he has turned his farm upside down, and lucky is he who does not find himself turned off before he can get it "right side up," once more.

The idea, which some entertain, that deep plowing, by loosening the soil to a greater depth, gives an outlet for the surplus surface water, and carries it down out of the way of plants (thus serving as a temporary drain) seems most fallacious. Paradoxical as it may seem, the loosening of any soil really renders it more compact and impervious to water. In every soil not recently disturbed there are little water-courses through which the water soaks down, and is gradually drawn off. These are the natural drains to the land. Even in clay lands these water-courses exist, though, of course, they are more numerous on lighter soils. In digging down, in wet weather, in land full of water, you may always strike these springs, at a few inches from the surface, where the water will flow, often in a stream as large as your thumb, or larger, and if you make an outlet or ditch, it will pass off to lower ground. The effect of plowing such land is to break up these water-courses, and make the land more compact and heavy than before. If any one doubts this let him dig a ditch, place in the tile, or stone enough to form a good drain, and even then, the earth thrown out will not fill it to the surface. So much more compact is the soil, when loosened, that, after a large post has been placed in a post-hole, dirt must be drawn from other sources to fill to the surface.

But it is said that the action of air and frost on the subsoil, will, in time, make it the best of land, and instances of large crops grown on pure subsoil, near old wells, or where a complete system of drainage has been carried out, are often cited as proof. If the land is wet, as much of our land is, and full of water, (in spring till the last of July, and in autumn from the first of August,) to plow it up is only to make the mire deeper. Such land needs to be drained first—then plow as deep as you choose—in naturally dry soils, deep plowing may be beneficial.

The prevalent idea that we must plow in the fall in order to give the frost a chance to act upon the soil, is equally contradicted by the facts of American climatology. When the frost every winter throws up our wheat and other winter grains, and even clover—when the mercury often sinks to zero, and sometimes far below—we may plow in the fall, for any other reason than that of "exposing the land to frost." The truth is, fall plowing is borrowed from the practice of English farmers, who naturally take pains to make the most of what little frost they have, and with them fall plowing is a most reasonable practice. But their land is drained, so that when it thaws it does not fall back into unfathomable mud, as it does here, but becomes light and dry in the spring. Besides, their seasons are wholly unlike ours. Well do we remember in childhood counting the months, weeks, and even days, to "the pleasant month of March," when, as our English primers informed us "spring would be here in all its loveliness," when (oh, delusive hope,) the trees would put on their beautiful robes of green, and the little lambs would be skipping and playing in the green meadows." It may do for children to be cheated by the climatology of English primers—but it is too bad for grown up men to adopt indiscriminately the ideas and practices of English Agriculture. —W. J. P. Henrietta, N. Y., 1859.

PROFITS OF BEE-KEEPING.

MESSRS. EDS.:—In a late RURAL, "A Subscriber," of Rome, N. Y., wants me to "sit down and give a true statement for the past ten years—if I have kept bees that length of time—and recount the profits of each year as near as possible, failures as well as triumphs.

Well, in the spring of 1851, I commenced with two swarms. One was in an old-fashioned box-hive, without any cap or box for surplus honey—the other was a chamber-hive, with a place to slip in a box that would hold twenty pounds. With these two swarms, the first year, I got four good swarms, two from each, and forty pounds of good honey from the chamber-hive—none from the other. The next two years, 1852-3, I put my young swarms in the old box-hives without any caps or boxes surplus honey, for the reason that some folks said if I took away the box honey my bees would run out, and, as I did not know much about the management of bees, for five years my profits were small, nevertheless, these five years, from the chamber-hive, I got from one to two boxes of honey yearly.

In 1855 I made nineteen chamber-hives. I got about thirty young swarms, and put nineteen of them in these hives and the rest in box-hives—that year I got no box-honey. In the spring of 1856 I had forty-two swarms, twenty in chamber-hives and twenty-two in the old box-hives, and from these forty-two I got nineteen swarms, and from the twenty chamber-hives, as near as I can recollect, 850 pounds of honey—none from the others. In the spring of 1857 I had fifty-three swarms, and about 700 pounds of box honey, which I sold for 10 cents per pound. The young swarms I put into hives made as recommended by Mr. Quinby—the best hive that I know of. In the spring of 1858 I had sixty-nine swarms, and from these I took, the past summer, 2,535 pounds, which I sold for 15 cents per pound. I am wintering eighty-one stocks this winter.

I never feed my bees. Such as won't winter I drive. As I generally have some weak ones in the fall, I put two together, and sometimes three. I try to keep my bees strong. All the box honey I ever had the bees got from the fields and woods for there is a plenty of white clover and bass-wood in this section of the country. I have always wintered my bees out in the air. My apiary is enclosed on the north and west sides, with a light board fence,—my hives stand about one foot from the ground, with the front raised about one inch, and in front, about half way up, there is an inch hole which I always keep open except when troubled with mice, then I put a piece of wire-cloth over the hole to keep them out. In cold, frosty weather I take a small stick and rap gently on the hive to warm them up,—they will get to buzzing, and their agitation will thaw out the frost in the coldest weather. I have had but one swarm freeze to death.

ERENNE LEWIS.

Reed's Corner's, Ont. Co., N. Y., 1859.

ABOUT CIDER-MAKING.

MESSRS. EDS.:—In the RURAL of Jan. 15th, I saw Mr. L. B. MANLY's article on cider-making, upon which I will make a few remarks. His idea of making good cider from wormy windfalls, and rotten apples, is correct,—it cannot be done. The using of mustard seed and raw beef to keep cider sweet is all nonsense, but it is said to be a "decided improvement" to rotten apple cider to drown a peck of rats in a barrel by leaving the bung out through the season. The last clause of Mr. M.'s article I believe to be erroneous,—no ingenious Yankee can invent a machine, or make cider quick, or at once, and have it good. My experience has taught me the contrary. If I desired to make vinegar, I would grind and express at once.

More than forty years ago I made cider for my father, in the State of Vermont, that was cider.—Our method was as follows:—Gather the apples, clean and dry, when ripe; grind them fine, (about 100 bushels at a time) let the pomace remain in the vat from 24 to 48 hours, according to the season, until the first signs of fermentation appear, (by producing little bubbles on the surface), then express moderately, or, rather, let it drain out. We used dry, clean, sweet straw to lay up the pomace; after the first run, the cider will be clear, high colored, rich and mellow in taste. The story is not all told yet. Every cider-maker knows, or ought to know, that a full barrel of cider, as it runs from press, will shake down from 2 to 4 quarts—this should be well done, by shaking and rapping the heads, then again filled to the full, bunged tight and placed in a cold cellar, and allowed to work or ferment through a spile, or gimblet hole, (the froth working over.) Towards the last I put the spile in gently, and raise it daily to let the wind puff out, replacing it quickly to keep the common air from it, continuing this as long as it requires vent. I then keep the cask tight, and all is done, but the drinking of good cider. Cider made in this way cannot work hard or sour, there is nothing in it to make it do so. Adding a gallon of good Brandy—not Logwood—when the cider is worked just to suit the taste, would be a decided improvement.

One word more, Mr. Editor. Will you try an experiment? Take two apples, (alike) bruise one gently to a pulp, not break the skin, let it remain 24 hours, then squeeze out the juice and note the color and taste. Bruise the other and squeeze out the juice quickly, and you will find a material difference. The first will have the richness of the apple, the last will only be fit for vinegar.

Back Woods of Canada, 1859.

WHAT AILED THE STEER?

EDS. RURAL:—A case has lately come under my observation, which is a new thing to me, although such cases may be quite familiar to cattle growers. I had a steer, coming two years old, quite thrifty and in good wintering condition. He was attacked with purging, although not in its worst form. He ate but little, and rumination ceased entirely. I apprehended nothing very serious, and let nature have its way for two or three days. I then gave two doses of epsom salts, and then a dose of castor-oil, apparently, without any effect. I gave him, at two or three times, a cud-ball, thinking he might have lost his cud. His horns contained the usual warmth until the last twelve hours. After he died I made an internal examination, found the 1st, 2d, 3d, and 4th stomachs in somewhat of a natural state; an unusual large liver, and an enormous gall, about five inches in diameter, or large enough to fill a two-quart vessel. I then thought it might be a concretion in the gall, searched diligently, but found no concretion, or stone in it. Any light upon such a disease would be very obliging to me.

Havana, N. Y., 1859.

WHEN TO PLOW CLAY SOILS.—Seeing in the RURAL of January 28th an article over the signature of "P.," which contains a challenge to any man to prove that he, "P.," is wrong, he says "many advocate fall plowing on clay soils for the purpose of making them more friable, but the best time to stir a tenacious soil, to effect a permanent amelioration, is in the summer." Now, if "P." will prove his assertion, it will gratify me and a great many more of the readers of the RURAL. I have seen tenacious soils always plowed in the fall—and the reason given was, that the action of the frost freed the soil and made it as loose as an ash-heap. Where the plowing was left till summer, the soil was always hard and lumpy, so much so, that it had to be harrowed and rolled a number of times before you could raise a mould on it, and then it was not in as good order as with the fall plowing for spring crops. As to a permanent amelioration, he might as well talk of a permanent plowing, it only lasts for one season.—J. F., Huntley, McHenry Co., Ill.

FOOT-ROT IN SHEEP.—For the benefit of your readers, I wish to inform you how I cured several sheep that had the foot-rot very bad. Pare away all the rotten hoof, then apply spirits of tar (keep the tar in a vial, with a quill in the cork), once in three or four days. I think common tar mixed with their salt helps to keep them in health.—W. L., Pondton, Niagara Co., N. Y., 1859.

Rural Spirit of the Press.

Consumption of Food by Cattle.

A CORRESPONDENT of the *Maine Farmer* gives his views upon this subject as follows:—"For the last half century there have been many disputes whether large or small animals are the most profitable. In my opinion the middle-sized animals, whether cattle or sheep, are the best, and the extremes are bad. The celebrated and far-famed Mr. Bakewell, of Dishley, Leicestershire, the man who lived a century before his day, was heard to say that flat-sided animals, with large, deep bellies, consumed much more food than barrel-formed animals with straight bellies (I mean bellies within a straight line drawn from the breast to the bottom part of the thigh); and that large-boned animals were great consumers of food. And the same great luminary in agriculture, proved what he asserted, by weighing food daily to differently-formed animals, great and small, the lesser consuming much less food than the larger; all of which was much in favor of Mr. Bakewell's new Leicester sheep, that have the least garbage of any kind of sheep in proportion to the weight of mutton—which has led the breeders of Lincolns, Cotswolds, and Down sheep, to imitate the Bakewell barrel-form, with small entrails. Common sense says large insides have entrails in proportion, and of course take a large quantity of food to fill them, which is worth consideration, as an animal may be great and good, and good and not great; size has nothing to do with profit. It is not what an animal makes, so much as what it costs making."

How to Make Butter.

In reviewing an article upon this subject published in the *Northern Farmer*, H. A. Cook, of Columbia Co., N. Y., remarks:—"We agree with the writer in regard to the kind of cows and quality of food, but when he speaks of the milk standing twenty-four hours before it is skimmed, we think he is not posted, for we use one of the four minute churns, and churn our milk right from the cow, having no trouble to churn from one to three pails full, with all ease, within that time, besides dispensing with our milk-cans and milk-room. By this system, we have our butter-milk new and sweet to feed the pigs, and certainly ten per cent. more and better butter, than by the old process.—He then says that 'the butter should be removed to a tray, and the butter-milk rinsed off with water,' &c. Now, in this section, we'd rather keep away the cold water, and the old 'tray,' and use William's butter-worker, which will enable the dairy-maid to work all the butter-milk out in less than one-quarter of the time than by the old way, and without blistering the hand, or making the wrist lame, which is often the case with the old ladle."

To Keep Tires Tight on Wheels.

A WRITER in the *Ohio Farmer* says:—"I desire to publish to the world my method of keeping tires tight on wheels. I ironed a wagon some years ago for my own use; before putting on the tires, I filled the timbers with linseed oil; the tires have worn out, and were never loose. I ironed a buggy for my own use, seven years ago, and the tires are as tight now as when put on. My method is to soak in linseed oil for one hour; it would be much better if the oil was heated. The timber should be thoroughly dry, as green timber will not take the oil. Care should be taken that the timber will be much more durable. I was amused some time ago, when I told a blacksmith of this method, as he replied that it was profitable work to tighten tires; and I suppose the wagon maker will say that it is profitable to make and repair wheels. But what will the farmer say?"

How to Fatten Lambs.

A CORRESPONDENT of the *Maine Farmer* says that Mr. Elisha Soper, of Orland, has for years fed grain to his sheep, for the purpose of forwarding lambs, but received but little benefit therefrom. He at last thought there might be a better way, so he tried the experiment of feeding his lambs with oats, in a trough made by nailing two boards together, covering the ends, and raising it six inches from the floor. He puts in the oats, and leaves them until the lambs learn to eat, which he says, they will do when about three weeks old. He leaves a passage for the lambs so small that his sheep cannot trouble them, both in his barn and in a yard made for the purpose, after going to pasture, and continues to feed until he sells, which is in June. He has lambs ten weeks old that will dress fifteen pounds per quarter.

Strong and Healthy Lambs.

Says the *American Stock Journal*:—"Lambs that come early are invariably the largest, strongest and most healthy; consequently, they are the best breeders. The ewe that has her lamb early has sufficient time to get in good order before winter, and after the lamb is weaned she is not subject to weakness and disease as are those of late weaning, and is consequently a better breeder the next season. Poor, late, feeble lambs and ewes should never be permitted to breed, for if such are, it invariably follows that the flock will degenerate. Generating or breeding ewes should always be selected. Ewes sometimes continue strong and productive until twelve or fifteen years of age; this depends on their general health and constitution."

WINTERING STOCK.—I see "R. M.," of Michigan, wants somebody's experience in wintering stock, and thus give him an idea why cattle will sometimes grow "lean," even though supplied with all (apparent) "creature comforts." I have been through the same mill,—went through annually,—until I learned, 1st, We must feed enough, and that which is good enough to get an animal thriving. 2d, They do better to keep entirely out of the yard except when feeding, or, in other words, not to fuss with them. 3d, A warm yard is better for stock than a warm stable. True, they will eat more out than in—and that is just what I like to see, for when animals eat heartily I soon expect to see them thrive.—H. D., Cayuga, N. Y., 1859.

DRY WEATHER is predicted by a would-be weather-wise man in N. C. In his opinion there will be no rain during the whole month of May. Cause why—he says the same thing occurred in 1859, and again in 1859. Save the rain-water, and prepare to irrigate!

Agricultural Miscellany.

HON. JOSEPH R. WILLIAMS has resigned the Presidency of the Michigan State Agricultural Coll. &c., much to the regret of many ardent friends of the institution.

THE Tenth Annual Fair of the Brookfield Town Ag. Society (Madison Co.) is to be held on the 28 and 29th days of September next.

READ the Advertisements, new and recent—none of them are very old. Many are just in season, and perhaps worthy of special notice, but this brief general reference must suffice.

LIFETIME OF BEES.—Prof. KIRTLAND, an experienced apiarist of Ohio, in a lecture on bees, states that the queen lives about four years, the workers six months, and the drones four to five months.

THE DEATH OF BENEDICT BROOKS, Esq., of Covington, Wyoming Co., is announced. Mr. B. was among the oldest and most highly esteemed and influential citizens of Wyoming, having long been prominently connected with its history. Though advanced in life, his decease is one of those and events which affect the surrounding community, and is regarded as a public loss. Mr. B. was a brother of Hon. MICHAEL BROOKS, recently deceased, and father of Maj. HENRY T. BROOKS.

A MAP OF YOUR FARM would greatly facilitate in making arrangements for crops this season. Perhaps you made one during the winter, and have also already decided positively as to which fields are to be devoted to food crops, and which are best for grain or seedling to grass. If not, you have no time to lose, as the busy, growing, warm season is coming on apace. It is not only time to "calculate," but to work and bring about results. Decide carefully and wisely, and then you can go ahead safely.

THE WHEAT CROP of the West is generally spoken of as very promising, by the papers—as usual at this season of the year. Little reliance can be placed upon the hap-hazard statements put forth so early in the season. "Wait a little longer," gentlemen, and don't glaze the market with an enormous surplus of grain before it has blossomed. We are glad to hear favorable reports, when well founded, but it is yet too early, we opine, to base calculations upon the best information obtainable—for considerable time must elapse before harvest, and the crop is liable to injury from bad weather, insects, &c.

"PLANT ONE ACRE MORE" is not always sound advice. The object of the farmer should not be to see how many acres he can plant, but how well and profitably he can cultivate a few. The wisest and best educated men are not those who have read or run over the greatest number of books, but such as have carefully studied and thoroughly understand a few of the best. It is far better to own and till from twenty to fifty acres in a thorough and profitable manner—"plowing deep while sluggards sleep"—than to undertake, with inadequate means and executive faculty, the culture and management of from two to five hundred acres, doing the work poorly, harvesting unprofitable crops, and paying an unnecessary amount of taxes.

HEAVY SHEEP AND FLEECES.—In a letter alluding to the statement of weight of carcass and fleeces of a pair of Merino bucks owned by A. Y. BAKER, of Steuben Co., N. Y., (the live weight of the two being 293 lbs., and washed wool 12 lbs.) Mr. Wm. JEFFREY, of Whitby, C. W., says that he has a three-year old ram, of the pure Leicester breed, which weighed when shorn last year 341 lbs., and the fleece, after washing, weighed 16 1/2 lbs. Mr. J. thinks that Mr. B. could have seen his ram—and wishes the latter would have thought little more of his Merinos. Both gentlemen evidently have good sheep—but as to which is preferable, or the most profitable, depends upon circumstances, such as the prices of wool and mutton, of the different breeds, proximity to market, &c.

DON'T BE ANONYMOUS!—Whatever may be your other sins of omission, kind reader, never omit your name in sending anything to the RURAL for publication. It is "labor lost," and don't pay either you or us—for, as we have repeatedly stated, we ignore anonymous articles. The only proper way to gain access to our pages is to give real name and post-office address—not necessarily for publication, but for our security and reference. Every week we receive many articles on practical subjects which have a good look—but, being anonymous, are consigned to the flames, and generally without reading, for it is useless to spend time with what cannot be made available. Reform it altogether, Messrs. Anonymous, and let us at least, if not the public, know who is who—thus saving, in the aggregate, a vast amount of time, brain-labor, ink and stationery. But if you will persist in the practice, don't complain, nor imitate the army in Flanders, because your productions, whether practical or sentimental, are omitted.

GOOD ADVICE.—Though perhaps rather late, we can refrain from giving part of an article entitled "Thoughts for the Season," received some weeks ago from a valued Western correspondent:—"Ye who are now about deciding what shall be the product of your fields the coming season, weigh well the subject, remembering that intelligent labor is better rewarded than physical, and that the craft you are managing can now be changed in its course and its returns increased or lessened as easily as the straw in the current. Carefully consider all the circumstances by which you are surrounded—the products which may be grown by your labor that are adapted to your farm—the probable wants and range of the market—with the experience of your neighbors on the subject. Your choice of crops has more to do with the reward of your labor than the amount of that labor; hence, before choosing use every endeavor to inform your mind and improve your judgment, as your labor, to be successful, needs to be understandingly applied. Next to choice of crops comes the cultivation thereof, which should be full, thorough and complete in every part, from the placing of the seed in the ground to the harvesting of the product."

THE CHOICE SEEDS we propose to distribute during the ensuing month or two (see offer on 7th page) are just what you want at this season, for everybody who can should grow beautiful flowers, or rare Vegetables, or both. They will grow while you are sleeping, and, if well cultivated, return a large dividend to please the eye and palate. But if you don't want to plant them, they will sell readily, or—what will perhaps afford still greater pleasure—you can give them to some appreciative lady friend! How many cousins will be rendered happier by our distributing a thousand or more packages of Flower Seeds!—to say nothing of the Wives, Sisters and Daughters. Come, Gentlemen, exhibit your gallantry—and especially you who believe ladies should cultivate Flowers, and make home and its surroundings attractive—by furnishing your fair friends the requisite capital to commence the pleasant business. If the Boys, Bachelors and Benedictines—will only do their duty, we will guarantee that the M's—Misses and Matrons—will perform their part creditably.

HORTICULTURAL

ACKNOWLEDGMENTS.

We are indebted to B. K. Balm and Allen & McElwain, of Springfield, Mass., for choice Vegetable and Flower Seeds; to Briggs and Brothers, of Rochester, and J. M. Thompson & Co., of New York, for collections of Flower Seeds.

—Also, to H. P. Byram, of the Valley Farmer, for seeds of the Virginia Lutea, and to F. A. Rockwell, Bridgefield, Conn., for seeds of the Baker Apple.—To E. Williams, West Bloomfield, for a box of Apples and a Squash Bug. Some of the apples, particularly the Baldwins, were fine. The bug is not curiously here, so we let him go.

—To W. N. Davis, P. M. Clarkson, N. Y., for Squash Seed. Mr. D. received them from a friend, grew them last year, and is willing to match this variety against the Hubbard or any other squash extant. We will try it.

Catalogues, &c., Received.—From R. Bunt, Philadelphia, Select Catalogue of Green-house, Hot-house, and Hardy Plants; Descriptive Catalogue of Hardy Trees and Shrubs; of Flowering Bulbous Roots; and Bulb's Almanac and Garden Manual.—B. K. Balm, Springfield, Mass., Descriptive Catalogue of Flower, Vegetable and Agricultural Seeds, very complete.—Allen & McElwain, Springfield, Mass., Catalogue of Vegetable, Flower and Agt Seeds.—W. Parry, Cinnaminson, N. J., Catalogue of Fruit and Ornamental Trees, Vines and Plants.—Eden Wight, Journal of the Massachusetts Horticultural Society.—Dr. C. W. Grant, Iona, colored plate of Downing's Everbearing Mulberry.—Ellwanger & Barry, Rochester, Pamphlet containing "brief memoranda" concerning the celebrated Mount Hope Nursery, from its founding, in 1833, to the present time.—addressed to Agricultural Societies in Europe and America, by Henry O'Rielly, Esq.—F. K. Phoenix, Bloomington, Ill., Catalogue of Fruit Trees, &c., at the Bloomington Nursery.

CULTURE OF THE GRAPE.—No. IV.

Messrs. Editors:—The conclusions arrived at in my last article, brought up in my mind another idea of great importance to be understood, namely, *Why should Vines be summer pruned just as the first blossoms appear on the clusters?* Autumn pruning reduces the buds on the vine to a small amount. When the roots begin to feed in the spring they take up sap and nutriment just as fast as though there had been no pruning. In a few days the vine is over-crowded with sap on account of the small amount of buds to exhaust it. This overplus sap in the vine forces out buds from the ground the entire length of the vine until they are of sufficient numbers to exhaust the supply of sap—that is, until the demand for sap is equal to the supply. And this is arrived at before the fruit begins to blossom. So it is clearly seen that autumn pruning is nearly or quite lost. Now, the fruit comes into blossom late, say in June; this makes a new demand for sap, but the young wood is growing in sufficient amount to exhaust it, and the young wood will take the preference in the sap before the fruit. Put off summer pruning a week after the vines are in blossom, and the labor is nearly lost. The fruit has dropped from the clusters, and the only benefit is to add size and quality to the scattering fruit on the clusters. Better be a few days earlier if it cannot be done as soon as the first blossoms appear. By this thorough pruning the vines are filled with sap again just the right time to set the fruit thick on the clusters. When that begins to make growth then it will take the preference in the sap over the young wood, as was clearly shown in my previous article, by the growth of young wood being nearly stopped until the fruit was about matured.

Vines on an upright trellis in the vineyard where they have but a given space to occupy, require different treatment in summer pruning. In all cases where convenient, build the trellis east and west, train the bearing wood up on the south side of the trellis. When the trellis is filled with bearing wood, in summer pruning shorten in all the branches to the second wire or slat from the ground—then let the branches below that extend without shortening, but keep the laterals off of them. This conclusion was arrived at by studying the course of the sap, and how it was applied or exhausted.—The sap is taken up by the ends of the small fibrous roots, passes into the pores or arteries between the grains of wood; in them it is carried up, and in its passage is distributed into every branch of the vine until it reaches the extremities; there it passes out of the wood into the film between the wood and bark, and is there held and crowded back, in part, clear on to the roots again. Its tendency is to remain on the extremities as much as possible. As proof of this it is found that all growing woods push forward the greatest growth on the extremities.—The sap is here dried away by the heat of summer, and exhausted in the formation of new grains of wood, new bark, the extension of the branches, the formation of leaves, and the perfecting of the fruit.

Every close observer has discovered that grapes clear on the extremities of the vine will change color two weeks earlier than those near the ground or roots. Why? Because they are the most crowded with sap. Now, load the vines heaviest with fruit on the extremities, shorten in all the branches there that crowd the sap back, giving all the fruit a full supply of sap, and what it don't want is exhausted in growing young wood, mostly from near the base vines. All the ends of the branches that are not shortened back are crowded through on to the north side of the fruit and trained up there, where they form a sheet of young wood on the north side; on the south side is a sheet of fruit benefited by its protection. Reader, remember this. When the blossoms begin to appear on the clusters you may cut old wood, the sap won't leak; it has become too thick. Any time from then till the first of March, pruning can be done, but not so close in summer as to start the next year's fruit buds, and load the vines with another crop of fruit, and injure the next year's crop thereby.

West Bloomfield, N. Y., 1859. ALVIN WILCOX.

FLOWER OF THE VERTICILLATA CROCUS.

THE FLOWER GARDEN.—No. II.

EARLY SPRING FLOWERS.—THE CROCUS.

In our issue of March 26th we gave drawings and descriptions of the earliest of all spring flowers, the *Snow Drops*. Following these we have the *Crocus* family—beautiful in form, varied and gay in their attire. Too little attention has been given to these fine flowers. They make the garden pleasant when but for them it would be dreary, and at a time too, when, after a long winter of cold and snows and storms, the sight of the simplest flower is most grateful. All admire them, yet in how few gardens is a fair collection, or even one or two varieties to be found. Could they be planted when in flower, or in spring for early flowering, everybody would have them, but they should be set out in the fall, and are forgotten at that season by most planters. Now we advise all lovers of flowers to obtain a few dozen of the best varieties next September, and to aid in making the selection we give drawings of two and descriptions of most of the best varieties. Fine bulbs fit for flowering, can be obtained of most of the nurserymen, and at the principal seed stores, for about 50 cents per dozen.

The earliest variety we have is the *Cloth of Gold*, of which we give an illustration, from a flower which we picked for the purpose, on the 18th of March. It is a lively golden yellow, with a brownish stripe, finely feathered on the edges, in the center of each petal, as will be seen by the engraving, which also exhibits its size.

FLOWER OF THE CLOTH OF GOLD.

March 24th, we took notes and some drawings. This, the present season, was about the best time for a general view of the family, though several of the late sorts are not yet in flower.

La Neige is a very large flower, whitish, with purple stripes on bottom of petals. When fully open, so that pistils and stamens are seen, it is remarkably showy.

Scotch, white, with a number of narrow stripes of blue on each petal.

Largest Yellow—deep yellow, almost orange—the largest and most showy of the yellow sorts.

Verticillata is a large flower, of a light purple color, with dark purple stripes.

Monstreuse, dark blue and purple—in color very much like the blue *Fleur de Lis*—very showy, and forming a beautiful contrast with the light colors and yellows.

Azureus Incomparable—in color and general appearance very much like *Monstreuse*.

Celestial—one of the very largest. Base of petals, dark blue, this color running upwards towards the tops of the petals, which are variegated, with purple blotches on whitish ground.

Camelion—whitish, with a rose tinge and purple stripes, somewhat of a reddish tinge.

L'Amant—large flower, bluish white, with purple stripes, heavy at the base, clouded at the upper parts of the petals.

Verticillata—whitish ground, with three horizontal purple stripes, branching into numerous feathery vertical stripes. Our engraving gives a good view of this flower.

David Rizzio—one of the largest and most magnificent of the dark flowers. Reddish purple, striped and mottled with lightish purple, blue and white.

Inquiries and Answers.

GARDEN WALKS.—Will you inform me, through your valuable paper, of a simple way of making a neat, dry, and durable footpath for a door-yard or garden?—J. JENKINS, New Jersey, 1859.

THERE is no difficulty in making a dry walk, if a fall for drainage can be obtained. Stake out the path, the width and form required its whole length, placing the stakes within three feet of each other, if the walk is curved. Then remove the earth from between two rows of stakes to the depth of eighteen inches, or two feet. This will make a ditch of the exact form of the path. Fill this ditch to within six inches of the top with cobbles, stones, bricks, or any refuse stone that may be handy, packing them so as to have a smooth surface on top. To do this it may be necessary to reserve the smoothest stones for top dressing. Cover this first with about three inches of coarse gravel, and then with three inches of fine. The lowest part of the path should, if possible, be connected with some drain, as an outlet for the water, but unless the ground is very low this will make a dry path.

BEST GRAPE FOR CONNECTICUT, &c.—Will the Bartlett Pear grow on gravelly, very rich ground? I have a good spot of ground where I wish to set a grape vine. It is twelve feet from a thrifty young Concord vine. Last fall I dug a hole wide and deep, and filled it with rich matter, and am going to finish with two barrels of bones, leather scraps, and rich earth. The land around is very rich. I wish to set in this spot the best kind that will grow in this State. Now, is it the Delaware? The Isabella I would not have, for it winter-kills, and will not ripen before frost.—R. J. SUFFIELD, Conn., 1859.

THE *Bartlett Pear*, on its own roots, we think, would succeed on your soil. The *Delaware* is a beautiful, delicious little grape, ripens early, and so far as we have been able to ascertain, proves hardy wherever it has been tried. The *Hartford Prolific* is growing into favor in the New England States. In quality it is inferior to the *Delaware*, but ripens early, and is extremely hardy and prolific—at least this is the character it receives from those best acquainted with it.

THE CHERRY SLUG.—Will the editor, or some of the correspondents of the *RURAL*, inform me with regard to a worm or shellless snail that infests pear and cherry trees, adhering closely to the leaves, eating the thinner part, and leaving the remainder dry and lifeless. They do not probably ascend the tree, as they are rarely seen on the body, and when they have been destroyed, were more numerous than the leaves the following morning. They withstand the application of dry ashes, sown broadcast, are seldom seen to move, and have no apparent legs. They vary in length, from one-eighth of an inch to three-fourths, and some of them are three-sixteenths of an inch in diameter, with a (supposed) head, one-third larger. They are of a dark ink color, very glossy, soft, and easily mashed. They commenced their depredations in this vicinity in the summer of 1856, I think. What are they, and what will destroy them?—O. C. WART, Georgia, Va. 1859.

This must be the *Cherry or Pear Slug*. We have destroyed many thousands by dusting them with fine lime or ashes. It may be necessary to repeat the operation several times to get rid of all. Tobacco water is said to be good, but the ashes and lime being more convenient, and effectual, we have never tried it.

SOAP FOR TREES.—I noticed, last season, that the apple trees in a neighbor's orchard presented a very smooth, clean appearance, not a sign of any lice, worms, borer, or any other pest that trees are damaged by. He told me he rubbed over every tree and the limbs, as far as possible, with common bar soap before the buds opened, and that it would not wash entirely off till fall, and was almost a perfect protection against vermin. Is the soap in any way injurious to trees?—G. D. C., Rosendale, Fond du Lac Co., Wis., 1859.

We have often seen soap used for this purpose, and without any perceptible injury, but a marked benefit. A gentleman of much experience, in the Southern part of this State, has promised us an article on soaping trees, which he believes to be a sure and certain protection against all injurious insects.

THE LANTON BLACKBERRY.—Have you faith in the *Landon or New Rochelle Blackberry*, that there is as much said about? It is convenient, will you please, in the first number that you issue after you receive this, state, in an editorial article, and in a word as you can, what you think about them? Do they grow to a large size? And would they probably do better in a mild than they would in a cold climate?—F. B. C., Chicago, Ill., 1859.

The *New Rochelle Blackberry* is of large size, bears abundant crops, is of good flavor when fully ripe; terribly sour and unpleasant if eaten before ripe. It gets black long before ripe, and those who are not judges are apt to pick the unripe berries, but we never make a blunder of this kind, for we can tell a ripe berry by its bright, glossy and plump, or fat appearance. The unripe wood kills back somewhat here, and in Illinois laying down and covering with a little earth or straw would be necessary, we think.

GROUND NUTS.—Being a reader of your valuable paper, I take the liberty of asking you a question or two, as I deem you a proper person to appeal to for the information I want. Wishing to raise some ground nuts this season, I wish to know what kind of soil to plant them on, what time to plant them, and how to tend them through the season, and what time they should be dug? If either you, or any of your numerous subscribers, who see this, will give me the desired information, it will greatly oblige—W. E. H., Milan, O., 1859.

PEA NUTS should be planted at corn planting time. A warm sandy soil is best. A correspondent at Aberdeen, Ohio, writes as follows, and answers most of the above inquiries: "Pea-Nuts can be raised here in the greatest perfection. I have raised them with little trouble, in the following manner, on sandy soil:—Plant three peas to the hill, and the hills eighteen inches apart. Each joint will produce a large cluster of fruit. Dig after the first frost in autumn." Keep the ground mellow, and all weeds destroyed.

AN ORCHARDIST IN TROUBLE.—I see many inquiries and answers in your *RURAL*, and I wish to make an inquiry. I set a young orchard of apple trees, and two years ago they began to bear excellent fruit; last year not so good, and now many of my trees are rotting, the rot commencing near the ground and going up nearly two feet. What can be done for the trees? They look too nice to lose. Will some one tell me how to save my orchard?—W. H. L., West Rush, N. Y., 1859.

Our friend should have been a little more specific. Are all the trees affected in this way? Is the soil drained? or does the water lay a good part of the year within a foot or so of the surface? and is not the surface sometimes covered? What is the nature of the soil and subsoil? Was the ground subsoiled before the trees were planted? Are other orchards in the neighborhood flourishing on a similar soil and with the same treatment? With such facts before them we have no doubt some of our correspondents could tell the cause and the remedy.

FLOWERS.—Can flowers be grown on a mound of pebbles? If so, how? Please answer through the *RURAL*. Will you please name some of the prettiest annuals?—A LOVER OF FLOWERS, Barre, N. Y., 1859.

We have no special liking for mounds—they are too stiff and artificial—too fussy—look like children's play-houses. Our climate is so hot that a small mound becomes dry and the flowers perish unless especial attention is given to watering. Among the prettiest annuals are the *Ten Week Stock*, *Balsam or Ladies' Slipper*, *Aster*, *Phlox Drummondii*, *Portulacca* and *Petunia*.

GRAPE VINES.—I want to set out a small vineyard this spring. Will you please inform me if it will make any difference in getting the vines from seventy miles south of this; or if you would prefer them from the same latitude?—S. H., Whitewater, Wis., 1859.

The difference you speak of will be of small account. The planting of the vines in a good, dry soil, where the wood will become ripened in the fall is of much more consequence.

BLACK CURRANTS DROPPING THEIR FRUIT.—There is a friend of mine, an M. D., who wishes me to inquire through the *RURAL* why the fruit on his black currant bushes always drops off. They do so invariably every year, and he has tried every means he is in possession of and cannot prevent it.—O., Gainesville, N. Y.

Does the fruit drop off when in a green state, or on becoming ripe? We have never been troubled in this way.

THE QUINCE.—I intend to plant some Quince bushes this spring, and wish to be informed which is the best to plant for market.—W. L., Pendleton, N.Y., N. Y., 1859.

PLANT the Apple or Orange Quince.

THE ALLEN RASPBERRY.

ED. *RURAL NEW-YORKER*.—In your paper of the 19th inst., W. R. COPPOCK reiterates a part of his charges against me in connection with the "Allen Raspberry." I shall not bandy words with him, but will give him an inducement to prove the truth of his allegations without risk on his part—and thus:—He reports, that I got my original plants of W. H. SORAN, which includes the other fact, to wit, that they are the "False Red Antwerp," and also, that my plants are no bearers, or words to that effect. I will deposit One Hundred Dollars in White's Bank of Buffalo, subject to the order of said COPPOCK, on a certificate of either one of the Judges of the Superior Court of the City of Buffalo, in the event that within two months from this date he proves his assertions true before said Judge, or any referee that either one of those Judges will appoint; and COPPOCK may name the Judge. The evidence proving C's assertions to be subject to the rules of said Court. I name HIRSH E. HOWARD, Esq., of Buffalo, to adjust the arrangement on my part. Now, let this man win the money, by proving his assertions true, or concede himself a slanderer and a falsifier.

Black Hook, March 21, 1859. L. F. ALLEN.

A HINT.—A subscriber in Tazewell Co., Illinois, earnestly requests us to publish the following:—ENS. *RURAL*.—I do not know whether a humble mud will like myself should do what I am about to, but I wish to whisper in the ear of those persons having Grape Vines, Gooseberries, Currants, and such other small fruits to sell, to let the fact be known in the *RURAL*, as there are many like myself who wish to purchase, and don't know where to send, or what they will cost.—AGRICOLA.

Horticultural Advertisements.

BAKER APPLE GRAFTS, to mail, post-paid, 50,000 WILSON'S ALBANY STRAWBERRY PLANTS with a true, 91 per 100. Address: 208 FULTON STREET, N. Y.

80,000 ANGERS QUINCE, STOCKS AND STOLLS. A fine assortment of Apple Seeds, Willow and Princes Currants, Grape Vines and Currants. For sale cheap, by COMBLES & WARREN, Syracuse, N. Y.

WATERMELON SEEDS. Eight choice new varieties put up separately in one package, and mailed to any address on receipt of 25 cents. Direct to D. D. TUCKER, N. Y.

SQUASHES.—Chinese Yam—superior to the Hubbard—and Honolulu, the best in cultivation. Seeds sent by mail sufficient to raise over 100 squashes for 50 cents. stamps. [483] I. S. PELLIT, Wilson, N. Y.

THE ALLEN RASPBERRY.—I can supply a quantity of these highly valuable, well approved *Edinburgh* Raspberry plants, which I have had in successful bearing for the past ten years.

Price, \$1 per dozen—\$5 per hundred—\$50 per thousand. Orders, with money inclosed, addressed to the undersigned, 1000 Rock, N. Y., will meet with immediate attention. They can be sent by express, or other conveyance, to all parts of the country. [483] LEWIS F. ALLEN.

TWO NURSERYMEN AND OTHERS.—The subscriber, or his firm, two miles to the north of Farmington, Co., a stock of some 2,000 Apple Trees, comprising all the popular varieties. These trees are four years old, large of their age, straight and thrifty, with fine fibrous roots, and in excellent condition for transplanting.

As the land is a noted fruit land, the trees will be sold, in quantities of not less than 1,000 of assorted varieties, at 70 per thousand, delivered on the premises. In case the entire lot can be sold at one time, a reasonable discount will be made from the above named price. Terms made easy. For further particulars, address 473-21 CARLTON H. ROGERS, Palmyra, N. Y.

9,000 PLANTS LINNÆUS RHUBARB.

BROWNLEE BROWN, Newburgh, N. Y.

STOCKS.—100,000 French Quince Stocks.

60,000 Mahaleb Cherry Stocks.

Evergreens.—Norway Spruce, all sizes from 3 to 6 feet; Scotch Pine, Austrian Pine, Silver Fir, Chinese Arbor Vitae, Blue Spruce, White Spruce, Balsam Fir, and the usual variety of Pear, Apple and Cherry—Standard and Dwarf.

481-51 W. P. TOWNSEND, Lockport, N. Y.

FRUIT TREES FOR SALE CHEAP.—Being under obligations to clear about 25 acres of nursery ground, containing a large quantity of Apple, Pear, Cherry, Plum, Peach, and Ornamental Trees, and various other articles in the Nursery line, all good and healthy stock, I will sell at very low rates, in quantities, to dealers. Apply at my residence, on James St., one mile from the city, or by letter.

H. M. RANNEY, Jr., proprietor.

481-51 Commercial Nurseries, Syracuse, N. Y.

FLOWER SEEDS BY MAIL.—Our Catalogue of choice and rare seeds for 1859, containing a descriptive priced list of nearly ONE THOUSAND VARIETIES OF FLOWERS, and also a list of

FORTY COLLECTIONS BY MAIL, together with a descriptive list of all the most desirable

varieties in cultivation, including many new and rare varieties, and an illustrated Treatise on Grasses—with practical directions for their cultivation—will be forwarded free to all applicants. Orders solicited.

Address ALLEN & McELWAIN, 481-51 Seedsman and Florists, Springfield, Mass.

WILSON'S ALBANY SEEDLING.—THE BEST

150 to 200 Bushels per Acre! Genuine Plants of this superior variety for sale, in large or small quantities. Price, \$10 a hundred—\$1.50 a hundred, or \$1 for fifty.

Red Antwerp Raspberry canes, \$4 per 100—\$2.75 for 50, or 16 for \$1.

New-Rochelle (or Landon) Blackberry canes, \$10 for 100—\$6 for 50—\$4 for 25—\$3 per dozen.

Yeastables in bulk, securely boxed and delivered in Albany, without extra charge.

Orders accompanied by cash promptly attended to.

W. M. RANNEY, Jr., proprietor.

481-51 96 South Pearl Street, Albany, N. Y.

LANTON OR NEW ROCHELLE BLACKBERRY.—PAUL HENNING, the undersigned, Agents for Messrs. Geo. Skymoon & Co., and other Nurserymen of position and reputation, offer the above remarkable Plants at the following very low range of prices.

One Hundred Plants, \$1.00. Two Dozen Plants, \$1.00. Five Dozen Plants, \$1.00. One Dozen Plants, \$1.00.

Large Plants for setting, of a standard size, will be sold for \$1.00 per 100 Plants, or \$1.00 per 100 Plants. Warranted genuine. Pamphlets descriptive of origin, history, characteristics and culture, sent on receipt of six cents.

Produce Commission Merchants, 85 Barclay St., New York.

We refer to HON. HONORABLE GREGORY.

AM. BLACK RASPBERRY PLANTS.—For sale at

\$1.00 per 100. Also seeds of the best South Carolina

Squash, 12 seeds will be sent on receipt of 12 cts. in stamps.

Address S. C. HARRIS, Geneva, N. Y.

NURSERY TREES.—A large quantity, with the usual

variety kept in Nurseries. Cultivated on high ground. Very thrifty and fine. For sale very low.

184 11 GRAVES & WARNER, Syracuse, N. Y.

O. B. MAXWELL & CO., Danville, V. Y.—Offer

Standard Plum, 2 1/2 years, \$25 per 100.

100 cts. Cherry 2 1/2 years, \$25 per 100.

Houghton's Seedling Gooseberry 5 " "

Lamb's Blackberry, 1 year, 7 " "

Genoa Orange, 2 yrs, 6 " "

Mazzard Cherry 1 year, 4 " "

Catawba Grape, 1 year, \$5 per 100—\$10 per 1,000

Danville, Liv. Co., N. Y., March 11, 1859. 490-21

AMERICAN HOP TREES.—The subscribers request

the above Tree as a substitute for the unsightly

and troublesome Hop Vines. The Hops grow in large

clusters, are much stronger and more preferred to the ordinary

Hops. Tree is perfectly hardy, highly ornamental, and will

bear the second year from seed. Trees from 75 cts. to \$1.50

each, or seeds free, by mail, for nine cents stamps.

McILVAIN & YOUNG, Seedsmen.

No. 9 John St., New York.

LINNÆUS RHUBARB, AND ASPARAGUS.

Line, strong roots for sale by

T. C. MAXWELL & BROS., Geneva, N. Y.

479-51

PEACH TREES.—A few thousand good two year old

Trees for sale by T. C. MAXWELL & BROS.,

March 10, 1859. [479-51] Geneva, N. Y.

RASPBERRY PLANTS.—Of the best leading sorts,

including the Antwerp, Brinkley's Orange, Franconia,

Fastolf, Knevet's Giant, and Rivers' Large Frooted Month-

ly. For sale by T. C. MAXWELL & BROS., Geneva, N. Y.

479-51

EARLY PARIS CAULIFLOWER and Premium

Flat Dutch Cabbage. Both sure to head, and are the

best varieties known—12 1/2 cts. each, per package, by mail.

Address MACDON CENTRE, Wayne Co., N. Y.

479-51

NURSERY.—Partner and Capital wanted in a well

established Nursery. Address Box 115, Syracuse, N. Y.

THAT NIGHT.

Two stars were never half so bright,
Nor shone with half so pure a light,
Nor filled the soul with such delight,
As on that night—that glorious night.

Nor ever angels came so near,
Nor whispered into mortal ear,
In tones so gentle, yet so clear,
As then I heard and loved to hear.

Never leaves so lightly stirred
By summer breeze or wing of bird,
Yet from each leaf a voice I heard;
One word from all, and love the word.

Never the blue waves sought the shore
So tremblingly, so silvered o'er;
Never was earth so fair before,
Never the skies—nor will be more.

Never the stars were half so bright,
Nor the world so full of delight,
Never the heart so full of light,
Never it will be, as on that night,
Never, no, nevermore!

Eastings, N. Y., 1889.

ROSELIA.

Plain Talks to American Women.—No. 7.

BY MRS. M. P. A. CROFIER.

ANOTHER subject, which commends itself to our attention while treating more particularly upon moral education, is *truthfulness*. It is said that so many children are so early taught falsehood by maternal lips!—indeed, we believe some mothers are not aware how untruthful they are to their little ones. Let us illustrate.

Mrs. A. is a member, in good standing, in the nominal church—thinks she is a Christian, and desires that her children's hearts be early imbued with the influences of the Holy Spirit. She is astonished, and grieved, some day, to hear her little son, when reproved by his sister for telling a falsehood, reply, "Why no, Mary, it is not wrong—'Ma tells lies!'" She calls the little boy to her side and says, "What do you mean, my child?—your 'Ma tells lies!'" "Why, yes, 'Ma,'" he ingeniously replies, "don't you remember when you went to town the other day, you said if I would stay at home and be a good boy, you would bring me something?—and you didn't bring me anything at all, though I didn't cry a bit! Wasn't that a lie, 'Ma'?" Mrs. A. hardly knows what to answer, but at length says, "Well, I forgot it, Willy—I will get it next time." (Be careful, mother, that you do not forget again!) "Well," says Willy, triumphantly, "you told me the other day that you would punish me if I was naughty, and I was ever so naughty, and you didn't punish me at all, but told Mrs. Surr who had just come in, that children would be children—I'm sure that was a lie!"

How can that mother lift up her head before the face of that intelligent and trusting child, who is sure she has told him a falsehood, and that it cannot be wrong, for mother is a Christian? Ah, the best she can do, is to get down into the valley of humiliation, and confess her sin—yes, confess it to her child, and with him ask God to forgive her, and assist her in future to obey his law, and then, in the midst of her own tears, point out and illustrate the sinfulness and the result of untruthfulness.

Again, Mrs. B., a merry-hearted woman, but with no very decided principles upon this subject, is called to the window some day by the exclamation of her little daughter, "The soldiers are coming—the soldiers are coming!" "Where, Lizzie?" she says, "I do not see them!" "O mother," replies the child, "I only said it for fun! Don't you remember what fun we had the other evening at the tea-table, when you told father you had some of the best tea he ever drank, right from Yorko's, and it was only hot water sweetened with brown sugar?—and when you laid the blank letter under his plate—how, when he tasted the tea, and opened the letter, you said 'April fool!' and then we all laughed so?"

"Well, Lizzie, you are a bright child!" exclaims the mother, as she laughingly returns to her work, and Lizzie, full of the idea that she is smart, because she has been successful in deceiving her mother, is ready to go and play off her tricks upon the girl in the kitchen.

Can it reasonably be expected, under such circumstances, that child will grow up truthful and truth loving? Far from it. The heartless coquette of future years will take the same pleasure in deceiving those who may kneel at the door of her heart, that the child at the window did in deceiving her mother. Truly, as a writer says, "A straw will make an impression upon the virgin snow. Let it remain a short time and a horse's hoof can hardly penetrate it. So it is with the youthful mind. A trifling word may make an impression upon it, but after a few years the most powerful appeals may cease to influence it. Think of this, ye who have the training of the infant mind, and leave such an impression thereon as will be safe for it to carry amid the follies and temptations of the world."

Truth is so lovely, that there would seem to be no necessity of impressing upon the mind of the thoughtful and Christian mother the necessity of implanting its principles in her child's mind, if she would have the child a moral character developed to a noble standard. Some writers thus elegantly discourage conscientiousness:—"Truth is beautiful as glittering diamonds or burning rubies, as lovely as the sun when he sinks to rest in his western hour, and as pure as pearls in a lake of crystal."—"It is as peaceful as a summer's midnight when nature, for a season, sleeps in calm repose, as serene as an angel of mercy when ministering to virtuous innocence, as sincere as justice upon her throne."—"It is as uniform as the moon in her starry rounds, and as consistent as goodness associated with honesty."

Would you not have your child's soul wear so bright a gem? And what shall we say of falsehood, the child of the Prince of Darkness? How it comes upon the heart, and what a deadly sting of sweetest words in the heart! Let us become a wide-spread place where truth can grow, and a beautiful thing—where no flowers can shed their fragrance!

Written for Moore's Rural New-Yorker.
"FEMININE APPAREL."

IN the RURAL of Feb. 26th, "SISTER FANNIE" had a short article upon "Feminine Apparel"—an article which does not coincide with my views of the subject. Although she says that all sensible people are on her side, I would like to express my "feelings," if I do not intrude upon the good graces of the public in general. I must say that "hoops" improve the figure of a lady, but, like everything else, there is a bound of reason. A person can wear them too large, and look more like a balloon than a human being, and then, again, she can wear them so as to look very pretty.

But a woman can't look like a woman with a short dress and pants on. No, I say they can't, for woman was designed, from the beginning, to wear long, flowing robes, and the men to wear pants—and I think that if a woman does not still adhere to long dresses, she views the subject in a wrong light. I have seen several ladies I suppose they called themselves—dressed in short robes and pants, their hair cut and combed in true masculine style, wearing hats, and I must agree with my brother who says that they are regular specimens of that genus of whom every one has heard, viz., "Gals Boys."

A woman may wear bloomers at home about her work, but when that is done, then put on a long dress and be a lady. If I ever should put on a short dress and pants, (and I sincerely hope I never shall,) I shall soon doff the short skirt and put on a coat. I will dress like a man and be done with it—not go half. My motto is, "the whole or none."

I don't know but I am saying too much against "FANNIE's" opinions, but I must free my mind. Now, my sisters, think of these things a second time—I presume you thought of them after "FANNIE's" advice—but think of them a second time, and let the Dress Reform go, and keep on the hoops and long robes. MOLLIE FLANG.

Grove Hill, 1889.

How YOU MAY KNOW GOOD FATHERS.—It is a good sign and true when you see, amid a little group of boys, one dart from the rest, and tossing his arms above his head, shout, "There's my father!" as he runs to meet him. You may be sure, no matter what business troubles sever that man may have, that there is a spot in his heart still fresh and green, which the cares of the world have had no power to blight. "There's my father!" With what a pretty pride the little fellow shouts this! He must be, indeed, a brute, whose fatherly heart does not swell with love, whose eyes do not glisten, who does not, at such a moment, feel amply repaid for that day's toil, no matter how wearisome. After all, *Love* is the only thing worth having in this world. Fame, and money, and ambition, dwindle to nothing beside the white, calm brow of death, though God knows it may be but the youngling of the flock, whose lips have never even learned to syllable their name.

AN AGED WOMAN.—Let the aged woman be no longer an object of contempt. She is as helpless as a child; but as a child she may be learning the last awful lesson from her Heavenly Father. Her feeble step is treading on the brink of the grave; but her hopes may be firmly planted on the better shore which is beyond. Her eye is dim with suffering and tears; but her spiritual vision may be contemplating the gradual unfolding of the gates of eternal bliss. Beauty has faded from her form; but angels in the world of light may be weaving a wreath of glory for her brow. Her lip is silent; but it may only be waiting to pour forth celestial strains of gratitude and praise. Lowly, and fallen, and sad, she sits among the living; but exalted, purified, and happy, she may rise from the dead. Then turn, if thou wilt, from the aged woman in her loneliness; but remember she is not forgotten by her God.—Mrs. Sigourney.

A BEAUTIFUL FAITH.—"Beautiful, exceedingly," is the burial of children among the Mexicans. No dark procession or gloomy looks mark the passage to the grave; but dressed in its holiday attire, and garlanded with bright, fresh flowers, the little sleeper is borne to its rest. Glad songs, and joyful bells are rung, and lightly as to a festival, the gay group goes its way. The child is not dead, they say, but "going home." The Mexican mother, who has household treasures laid away in the *campo santo*—God's sacred field—breathes a sweet faith, only heard elsewhere in the poet's utterance. Ask her how many children bless her house, and she will answer: "Five; two here, and three yonder." So, despite death and the grave, it is yet an unbroken household, and the simple mother ever lives in the thought.

SPEAK KINDLY TO ALL.—How beautifully kind words sound to the ear, and how much they soften the feelings even of those that are somewhat disposed to the use of calumnious words. Recall, if you have a mother or father who has fondly nursed and cherished you from your infancy up to manhood, speak kindly to them. Gentle words are acceptable at all times and becoming in all places. Nothing looks more hateful than to see children disobedient and vulgar to their parents who have patiently watched over them in their infancy.—S. C. R., Rochester, Stark Co., O.

JEAN PAUL says—God and love are everywhere; in light, in colors, in flowers, in the beauty of man, in the happiness of animals, in the human mind, in the endless spheres; as the sun shines on all, alike yet differently, and is majestic on the ocean, sparkling in a dewdrop, ruddy on the ripe fruit, silver on the stream, many-colored in the rainbow, and pale and tremulous in the moon.

THE CROOKED FOOTPATH.

BY G. W. HOLMES.

An, here it lay the alighting rail
That marks the old remembered spot—
The gap that struck our school-boy trail,
The crooked path across the lot.

It left the road by school and church,
A penciled shadow, nothing more,
That parted from the silver birch
And ended at the farm-house door.

No line or compass traced its plan,
With frequent bends to left or right,
In aimless, wayward curves it ran,
But always kept the door in sight.

The gabled porch, with woodbine green,
The broken millstone at the sill,—
Though many a foot might stretch between,
The truant child could see them still.

No rocks across the pathway lie,—
No fallen trunk is o'er it thrown,—
And yet it winds, we know not why,
And turns as if for tree or stone.

Perhaps some lover trod the way
With shaking knees and leaping heart,—
And so it often runs astray
With sinuous sweep or sudden start.

Or one, perchance, with clouded brain
From some unholy banquet reeled,—
And since our devious steps maintain
His track across the trodden field.

Nay, deem not thus—no earth-born will
Could ever trace a faultless line;
Our truest steps are human still,—
To walk unwavering were divine!

Truants from love, we dream of wrath,—
Oh, rather let us trust the more!
Through all the wanderings of the path,
We still can see our Father's door!

Choice Miscellany.

Written for Moore's Rural New-Yorker.
THE BOOKS TO READ.

"Books, books, it makes me sick,
To think how you are multiplied;
Like Egypt's frogs ye poke up thick,
Your ugly heads on every side.

THAT sounds very much as though it might have been the effusion of some disappointed author. Vexed to see his own work sink into oblivion, he could not endure to behold with good grace the sea of literature crowded with other craft. But books are great blessings. The work of some favorite author neatly bound, is a "thing of beauty." They are none the less a blessing from the fact that they "poke up their ugly heads on every side." There are some things that are increased in value because they are universal. Does not the writer derive greater pleasure from the idea that a thousand will follow the track of his thought, than if only one could do so? There was once a time when books were only to be found in the cell of the monk, or in the libraries of the learned. But the fountain of knowledge has been opened, and its crystal waters refresh alike the lowly and the great. One, in his richly furnished and attractive library, reads *Mitros* "bound in gold," and another, by his cottage lamp, reads a "cheap edition" of the same. A tithe of the beauty the poet has created, is denied the poor laborer, because his copy is muslin-bound, thanks to the multitudes of printing presses, that have rendered the choicest literature so common.

What rare pleasure is it in the respite of toil to hold communication with a favorite author. Who that has once tasted so sweet a pleasure can forsake the quiet walks of literature for the noisy clamor of the pleasure-seeking world. Men, highly gifted by genius, are very rarely favored with those tastes and habits that fit one to be a favorite in society. Neither are great readers. The tastes and habits that qualify him to enjoy the pleasures of literature, disqualify him to be either a lover of, or a favorite in society. True, conversation with an appreciative companion, adds zest to reading, yet mixing up too much in society will destroy the taste for it. This should not be, and when society is what it ought to be, the reader and the conversationalist will derive mutual pleasure from each others company. The real lover of books can smile at the allurements of ambition, and say with the oft-quoted poet,

"My library is dukedom large enough."

Books are great travelers. If you never enjoy the privilege of an evening's chat with a *traveled* gentleman, the best way you can supply the deficiency is to read some well-written book of travels. If you are of a poetic temperament, take passage with CURTIS or with BAYARD TAYLOR up the far-famed old Nile. Mount a dromedary and sweep across the wild and terrible desert. Wander by moonlight with an Arab guide through the beautiful ruins that crowd upon either bank, or sail away, "beyond civilization, away into the savage heart of Africa." If you are a plain, matter-of-fact man, peruse LIVINGSTONE'S *Researches in South Africa*. Trace him in his fatiguing journeys on ox-back through tribes, friendly and unfriendly, assailed by sickness and discouragement, and when you close the volume, you will feel that you have been in company with a true missionary hero.—For plain common sense, sound philosophy and valuable information, he cannot be excelled. If you are fond of Polar Seas and icebergs, Dr. KANA will charm you many an hour.

If you are a lover of poetry, you certainly must be hard to please if you can find nothing to suit your taste. Every age has its crowd of poets, though some tower like giants above the rest.—Though the names of MILTON and SHAKESPEARE are on the pen of nearly every essayist, we need not go back to those to find true poetry. Neither need we go across the water, for we have a BRANT, WHITTIER, HALLECK, LONGFELLOW, and a PRENTICE. Their productions are sweet, charming, and true. But if you are partial to the older poets, the British bards look invitingly at you. Not to men-

tion those contemporary with Scott and Moore, read those of the time of GRAY and GOLDSMITH.—If you are in indolent mood, read THOMPSON'S *Cas-tle of Indolence*, but read it slowly, lazily, or you will not appreciate it. If you feel like being preached to, read YOUNG'S *Night Thoughts*. If you wish to enjoy a pure, classical flow of language, study POPE and GOLDSMITH. If you would have all good qualities, combined with a spirit of deep religious fervor, read the best works of COWPER.

Perhaps you are a lover of history. There is no branch of literature embracing a wider range of subjects, or capable of being rendered more fascinating than history. If you would really enjoy it read only the best authors. There are enough of the productions of first-class writers to employ all the leisure time the generality of people can devote to literary pursuits. Why then should any one spend so brief a life in perusing the pages of those writers unsound in morals, or lacking of healthful food for the intellect? From XENOPHON down to PASCAL, there are a perfect crowd of historians, but the indiscriminate study of all will not insure as complete a knowledge of history as the careful study of only the best. So it is with poetry, essays, and biography. Probably there is no branch of composition, that has suffered more from second-rate writers than fiction. Novelists, in order to command the interest of their readers, hold up to the imagination, highly wrought pictures. The false glare and glitter vitiate the taste of the reader, and he soon becomes dissatisfied with anything less showy. MACAULAY, D'AUBIGNY, and IRVING, are neglected for the Mrs. Southworths. Reader be careful to cultivate a taste for pure literature. It will do much toward building up a good and beautiful character. It will help to lead you to greatness. Select your library as you do your companions, with an eye to the influence they will exert upon your character.

"Come, my best friends, my books, and lead me on."

MINERVA OSBORN.

Butler, Milwaukee Co., Wis., 1889.

FACTS AND CIRCUMSTANCES.

CICERO's first great speech was made at the age of twenty-seven. It was at the same age at which Demosthenes distinguished himself in the assembly of the Athenians. Dante published his "*Vita Nuova*" when just twenty-seven. Dryden first gave testimony to his poetical genius at the age of twenty-seven. Bacon began to form his new system of philosophy into some form when about twenty-seven. Burns issued his first publication in his twenty-seventh year. Washington was but twenty-seven when he covered the retreat of the British troops at Braddock's defeat, and was appointed to the command-in-chief of all the Virginia forces. John Quincy Adams was appointed by Washington, in 1794, minister resident to the United Netherlands—thus commencing his public life at the age of twenty-seven. Napoleon, we believe, was only twenty-seven when he led the army into Egypt. Some of the poets that have been the pride of England, have commenced to write early in life. Some few, however, have produced their best pieces in old age. Cowper was fifty before he obtained any reputation as an author. Young never wrote anything that could be called poetry till he was over sixty; and was more than eighty when he published his poem on "Resignation." Chaucer wrote his best poetry after he was sixty. Pope wrote at twelve years of age. Cowley at fifteen. Chatterton at eleven. Samuel Rogers was fixed in his determination to become a poet by the perusal of Beattie's "*Minstrel*," when only nine years of age. Thomas Moore wrote poetry in his fourteenth year, which was published in the *Dublin Magazine*. Campbell wrote his poem on the "*Pleasures of Hope*" at twenty-one—the same age at which Pope wrote his essay on "*Criticism*." Shelley wrote at the age of fifteen; at eighteen he produced his wild, atheistical poem, "*Queen Mab*." Keats published his "*Endymion*" in his twenty-second year, a cruel criticism on which caused his death. Mrs. Hemans ventured on publication in her fifteenth year. Mrs. Norton composed her "*Sorrows of Rosalie*" in her seventeenth year. John Mayne in his sixteenth year published the germ of his "*Sil-lie Gun*." Hannah More published her "*Search after Happiness*" in her seventeenth year. Sir Edward Lytton wrote verses at the age of five or six years. Goethe died in 1832, a year which swept away so many of the great men of the European world—among others, Cuvier, Crabbe, and Sir Walter Scott. Cuvier and Napoleon were born in the same year, 1769. Mozart and Kosciuszko were born in the year 1779. Alexander Hamilton and Lafayette were born in the year 1787. Hegel, Wordsworth, and Chalmers were each born in the year 1770. Macpherson, Hereschel, and West were all born in the same year, 1738. Curran, Heber, David the painter, and Dr. Rush were each born in 1750.—*Home Journal*.

SWEET OLD AGE.—God sometimes gives to man a guiltless and holy second childhood, in which the soul becomes child-like, not childish—and the faculties, in full fruit and ripeness, are mellow, without sign of decay. This is that sought for land of Beulah, where they who have traveled manfully the christian way abide awhile, to show the world a perfect manhood. Life, with its battles and its sorrows, lies far behind them; the soul has thrown off his armor, and sits in an evening undress of calm and holy leisure. Thrice blessed the family or neighborhood that numbers among it one of those not yet ascended saints! Gentle are they and tolerant, and apt to play with little children, easy to be pleased with little pleasure.

PREJUDICE.—One of the greatest obstacles to the progress and admission of truth, is prejudice. It is akin to jealousy; a compound of the concentration of whims; a mote in the eye of reason. No living man can entirely divest himself of it. It not only greatly controls and biases the most of men, but it unconsciously lingers around some of the best men till the day of death. If we cannot conquer this gigantic enemy of truth, let us never cease to give him battle, and thus escape being conquered ourselves.

You had better find out one of your own weaknesses, than ten of your neighbor's.

"A DIRGE FOR THE DEPARTED."

BY ELEANOR C. LARK.

"A dirge for the departed."
For the childlike brow that he
Where lilacs, golden-hearted,
In beauty bloom and die;
For lights gone out forever
From the hearth-side and the home;
For hopes that Death's dark river
Away from our hearts has won.

"A dirge for the departed."
For manhood's strength laid low
Ere the triumph-light had parted
From the broad, undaunted brow;
For dreamings lost in shadow
Of the Valley dark and lone,
Showing no summer-meadow
Through the vistas darkly drawn.

"A dirge for the departed."
For the aged hands that kept,
Till life-chords slowly parted,
Their prayer-clasp when we wept;
For hearts that held our weakness
In the keeping of their love,
For faith that grew in meekness
To its sure reward above.

"A dirge for the departed."
For the blessings lost and gone,
For loves that life once started
In the flush of spring-time's dawn;
But not for souls gone early
Away from the toil and pain,
Not for the hearts worn sorely
Of sorrow's most bitter rain.

Safe in the lands of Heaven
The loved that we miss must be;
Then for the earth-lies given
Let anthems of praise flow free;
Up from the "bonding willows"
And the grave's dark, deathly door,
Parting the surging billows
They've gone to a brighter shore.
Charlotte Centre, N. Y., 1889.

WAY DELAY!

Why so many hearts, long bowed down by conviction of sin? Why so long sorrowing—so long doubting? Can we thereby add anything to our own worthiness to be accepted of God, or will He be the more willing to receive us? Nay, fellow-sinners, God does not require us to prepare ourselves for His kingdom; nor can we, by any exertion of our own, make ourselves more fit for it. Neither need we doubt His willingness to accept us. *Just as we are* let us come to Him—truly sorry for our sinful natures, and still more sinful practices—and at the foot of the cross give up everything to Him, making no reserve, and the self-same hour we do this God will graciously pardon our sins, and joy unspeakable will fill the sinner's heart.

Do we not by our long waiting show our disbelief of God's word, and of His ability to fulfil His promises? Or, does it not show a want of confidence on our part to trust our soul, our all to God, and while thus, by our actions, we accuse God of inability or unfaithfulness, can we expect so great, so very great a blessing from Him? As a friend, then, who fondly hopes to have tasted the "good word of life" let me entreat all who have not given their hearts to God, that without reserve, they immediately give themselves up to Him—go humbly by prayer and plead earnestly for the forgiveness of their sins.

And do any doubt being willingly received?—Aye, "I say unto you, that likewise joy shall be in heaven over one sinner that repenteth, more than over ninety and nine just persons, which need no repentance." It was Christ's mission into the world, the cause of His great suffering and death to provide a way, and *this very way* by which you might be saved. Read the account of His life and see how kind, how *very kind* He was to sinners while on earth. See how much compassion and love He had for them. God is well pleased at the return of the humble, penitent sinner. Go therefore and receive His richest blessings, nor delay or mourn.
B. P. D.

Brookland, Pa., 1889.

A BEAUTIFUL SENTIMENT.—The late eminent judge, Sir Allen Park, once said at a public meeting in London:—"We live in the midst of blessings till we are utterly insensible of their greatness, and of the source from whence they flow. We speak of our civilization, our arts, our freedom, our laws, and forget entirely how large a share is due to Christianity. Blot Christianity out of the pages of man's history, and what would his laws have been?—what his civilization? Christianity is mixed up with our very being and our daily life; there is not a familiar object around us which does not wear a different aspect, because the light of Christian love is on it—not a law which does not owe its truth and gentleness to Christianity—not a custom which cannot be traced in all its holy, healthful parts to the Gospel."

GIVE ALL TO GOD.—Keep not back part of the price. Make a full surrender of every motion of thy heart; labor to have one object, and one aim. And for this purpose give God the keeping of thine heart. Cry out for more of the divine influences of the Holy Spirit, that so when the soul is preserved and protected by Him, it may be directed into one channel, and one only, that thy life may run deep and pure, and clear and peaceful; its only banks being God's will, its only channel the love of Christ and a desire to please Him.—Spurgeon.

MAKE PROFESSIONS.—It is very possible for us to profess the name of Christ, and yet to be in fact, the greatest obstacles in the progress of his kingdom.—Wayland.

The Reviewer.

BOOK-MAKING AND PUFFING.

THE people of this country are a reading people—they desire knowledge—buy such books as are published and recommended by the press, and read them. Publishers take advantage of this thirst for knowledge, and cheat the people by getting up worthless patch-work books, made from others already before the public. And, what is worse, these book-makers generally know so little of the subjects of which their books treat, that they are as likely to steal the defects and errors of authors, as those parts of real merit. All that is needed to make one of these modern book-makers, is industry, some knowledge of the English language, so as to be able to write an introductory paragraph occasionally, and a sharp pair of scissors, and there is no end to the number of books he can get up, and on any subject desired. The only limit is the willingness of the people to buy them. A few pictures and bright-colored covers make these books look attractive, and they are ushered into the world, accompanied by windy advertisements in the papers, and showy hand-bills at the doors of the bookstores. A copy of each new book is sent to the editors of the papers, nine-tenths of whom do not pretend to any knowledge of the subjects of which these works treat. To aid such in getting up a puff, the publishers often inclose a slip containing such a notice as they would like to have appear in the paper. Editors frequently either adopt this notice, and give it as their deliberate opinion of the value of the work, thus imposing upon their readers, or look over the title page and preface, cast a glance over its pages, and as a return for the compliment of a free copy, write a puff, pleasing and profitable to the publisher, no doubt, but quite otherwise to the reader who may thereby be induced to purchase.

We have been endeavoring, in a quiet way, to expose, and if possible, correct this great evil, and as was to be expected, some publishers have become a little excited on the subject. Our course, however, is deliberately taken, and we shall pursue it to the end. If throwing turf will not answer, we shall ere long try stones. The necessity for a reform in this respect has long been felt by the editors of the leading agricultural papers in the country, and our course is approved, as will be seen by the following notice of an article we gave a few weeks since, which we clip from the *Boston Cultivator*:

We lately alluded to the necessity of a more thorough criticism of books on agriculture by agricultural journals. We are pleased to see that the same subject has attracted the attention of some of our contemporaries, and should the agitation of the matter result in bringing about a reform, it will be highly gratifying to the true friends of improvement. The making of books has been profitable, both with authors and publishers, the question—What will sell? has been the governing idea, rather than—What is true? The praiseworthy desire of the people to obtain knowledge, is abused, and their ignorance and credulity made use of to take from them their money. It is a matter of regret that to the true friends of improvement, the making of books has been profitable, both with authors and publishers, the question—What will sell? has been the governing idea, rather than—What is true? The praiseworthy desire of the people to obtain knowledge, is abused, and their ignorance and credulity made use of to take from them their money. It is a matter of regret that to the true friends of improvement, the making of books has been profitable, both with authors and publishers, the question—What will sell? has been the governing idea, rather than—What is true? The praiseworthy desire of the people to obtain knowledge, is abused, and their ignorance and credulity made use of to take from them their money.

The following is part of an able editorial article in the *RURAL NEW-YORKER*, and is worthy an attentive perusal.

In the *RURAL* of January 8th we alluded to this subject in rather plain terms, and in our issue for February 20th we noticed three small books, as representatives of the class of which we have been speaking; not, however, because these were worse than a score of others we might have selected; but they were on our table awaiting notice, and therefore convenient for our purpose. We quote a paragraph:

Here we have a series of small books, neatly printed, and the getting up, so far as the publication is concerned, is almost faultless. But they are the representatives of a class of books got up to sell, compiled from various sources by men who know little or nothing of the subjects of which they treat. The praiseworthy desire of the people to obtain knowledge is abused, and their ignorance taken advantage of to take from them their money. They seek bread, and are willing to pay for it, but often find that what they purchase is as worthless and barren of information as a stone. The author of the first two, must be a book-maker by trade, perhaps engaged by the month at his work, for it seems he has made books under a *How to Write*, *How to Behave*, and *How to do Business*, and perhaps on a dozen other subjects, and now manufactures a *Manual of Practical Agriculture*, telling practical farmers, and those seeking information, "how to cultivate all the field crops!" He must be a man of wonderful information—a miracle of knowledge, and should not hide himself under a bush, by concealing his name. "This truly strange that one small head can carry all he knows. But this is not all. He is not only prepared to tell people how to write, do business, behave, and cultivate all the field crops, but from the titles above, it will be seen he has also made a book to instruct people in the cultivation of vegetables, fruit and flowers, as well as ornamental trees and shrubs! Is it not time there was an end to this fraud or farce? Will not the people learn publishers that, if they wish their books to sell, they must publish works of merit? Will not the agricultural press come to the rescue, and tell the truth of the books they notice, and call this indiscriminate puffing, which has long enough cheated the public, and filled the country with worthless books?"

To this list of books, of which this gentleman pretends to be the author, we might have added one recently issued on *Architecture*, and another announced on *Domestic Animals*. Now, it is perfect nonsense to suppose one man competent to write a good book on all these subjects. A man might well spend ten or twenty years of his life in preparing material for a book on either of these practical matters. Our views on this point were given January 5th, as follows:

Who, in all this land, is competent to give us a good and reliable work on practical agriculture? But the ideas that have been proved a thousand times, not only ideas that never will be proved—but a book giving the teachings of experience, the results of well-tried experiments, for a book in a manner not to be gained. A life-time and a fortune might be well spent in the accumulation of facts, and a book to tell what a accomplished it would be a blessing to the country and the world, and place the authors name on the roll of fame, as a way out of sight of the journeyman book-makers who manufacture books to suit their employers, the publishers.

Life Illustrated, of March 12th, published by FOWLER & WELLS, who are also the publishers of the little books which furnished the text for our previous article, comes to the rescue, with a defence, and states:

1st. The notice we gave was the only unfavorable one of over 500 which the books have received.—This we do not doubt; nor will our readers be surprised at the fact, now that we have stated the manner in which these notices are obtained. It is this indiscriminate puffing of which we complain,

(more than we do of the books,) and which we are endeavoring to correct.

2d. About the number of books of which one man claims to be the author, the reply is:—"We have often seen people wonder at the expertness of gymnasts, and simply for the reason that they could not themselves perform the same feat." Such a feat as writing half-a-dozen books on as many different subjects, we will not be likely to attempt—nor any other man who is competent to write profitably on one subject!

3d. We are charged with inconsistency, because we advertise the books, and at the same time condemn them. We allow advertisers to say what they choose of their wares, over their own signatures, whether they are books, grapes, trees, horses or cattle. They alone are responsible, and the people know that advertisements are the statements of interested parties. When the editor gives his opinion, the readers have a right to believe that he expresses his honest sentiments, formed on evidence. One is considered as the expressions of a merchant endeavoring to sell his goods, the other the counsels of a competent and disinterested friend. We think there is a vast difference here.

4th. We are next taken to task because we last year spoke favorably of two books by the same author, *How to Talk and How to Write*. We have nothing to take back of what we have said of these works; but does it follow that because these two were good, and we said so, that the author was competent to learn people how to cultivate all the field crops, vegetables, fruits, flowers and ornamental trees, and instruct them in architecture and cattle raising, in the bargain? Because a man paints a barn, and we praise his work, are we bound to praise a daub of a landscape that he may afterwards paint? Or, because he shoes our horse well, must we have him doctor our eyes, teach our children, make our clothes, and prune our pear trees?

5th. Complaint is made because we have not shown the faults of the books, in the following language:

But really now, friend Moore, what fault have you to find with criticism to make, on the books under notice? You have occupied a good deal of space, but have not come to a point, and have not given the public the most remote idea why these books should not be purchased. Almost the entire press in the country—religious, political, secular, and agricultural—have united in pronouncing each of the nine volumes of this style of books, that we have published as being very much what you said you thought the first two were. Have they all, as well as the publishers, been mistaken? Are they books got up for the purpose of getting the people's money without rendering an equivalent, or are they what we claim for them—the very best books on the subjects on which they treat ever published for the same price?

We have not much space to spare, but we will devote a few lines to an examination of one of these books, *THE HAND-BOOK OF FRUIT CULTURE*. The *Grape* and the *Pear* are now the most interesting subjects in the whole range of Pomology, both to the amateur and the fruit-grower. Information is more needed, and more eagerly sought on these subjects than on any others. The feeling is general that a grape earlier, and if possible harder than the *Isabella* is needed, and at least as good quality. Sellers of vines, like the publishers, are over-praising their wares, and there is danger that many will be induced to plant sorts far inferior to our old well-tried kinds. Of course the *Hand-Book* will give valuable information on this point. We open at page 89, and there we find the commencement of the chapter on grapes, which consists of only three pages, and that an old and unsatisfactory article from *Pardee's Strawberry Book*, published in 1854, in which only the *Catawba*, *Clinton*, *Diana* and *Isabella* are mentioned, even by name. Not a word of the newer sorts, or an iota of knowledge added since 1854. What a valuable document for the anxious inquirer after knowledge!

About seventeen pages are devoted to pears, mostly occupied with outlines, with brief descriptions of a number of varieties, less full and satisfactory than can be found in the pages of any nursery catalogue. To the *Virgalieu* about two lines are devoted, and we are told it is "a fine market pear," but that it cracks over a large portion of our country, so as to be worthless, the reader must learn from some other source. All that is said of *Beurre Superfin*, which was figured and described in the *RURAL* a few weeks since, is simply this,—"Beurre young. Good on quince." Of what value, we ask, is such a description, to those who desire information?

Within a page or two of the end of the chapter on Pears, the reader is informed that the "above list (with descriptions condensed) is extracted from *Tucker's Annual Register*. The following are described in *ELWANGER & BARRY'S Catalogue*." A valuable book, truly, where the article on Grapes is taken bodily from a little work published in 1854, and the chapter on Pears from the *Annual Register* and a nursery catalogue. But our author has not the merit of copying correctly, for on page 107 we find three outlines of pears with wrong names attached; the slender, long-stemmed, delicate *Rostkizer* is made to be a short, obovate pear, with a thick, short stem, and the others are as badly off.

Cod's Transparent Cherry is described as new, because THOMAS first described it so in his book, ten years ago; although it has been fruited here twelve or more years.

Need we go further to show how unreliable this work is? How sadly those 500 editors, "religious, political, secular and agricultural," have imposed upon their readers by advising them to purchase such a book.

ADAM BRED. By GEORGE ELIOT, author of "Scenes of Clerical Life." New York: Harper & Brothers. 12 mo. pp. 496.

This is a closely printed and a very interesting novel of the very best class. The scene is laid in an English village, about fifty years ago. The hero, ADAM, was a hard-working, honest, able mechanic, and an adherent of the English church. The heroine, DIXIE, was one of good JOHN WESLEY'S converts, and, like Mrs. FLETCHER, and other noble women, felt it to be her duty to follow the example of her Divine Master, preach the gospel to the poor, and go about doing good. After refusing several offers of marriage, being determined to devote her whole time to the work in which she was engaged, she finally became the wife of ADAM BRED. Much may be learned in this book of English customs and village life, as well of the efforts of the dissenters to benefit the poor and ignorant, and the regard in which they were held by the "Establishment" section of the established church. The portraits seem to be fairly drawn. From the Publishers.

A TREATISE ON THE THEORY AND PRACTICE OF LANDSCAPE GARDENING. Adapted to North America; with a view to the Improvement of Country Residences, comprising Directions for Laying out Grounds, Description and Construction of Utility Fences, etc., etc., with Remarks on Rural Architecture. By the late A. J. DOWNING. With a Supplement containing remarks about Country Places, and the best way of making them; also an account of the Newer Deciduous and Evergreen Plants, lately introduced into cultivation, both hardy and half-hardy. By HENRY WINTHROP SARGENT. New York: A. O. MOORE & Co.

THIS, we need not inform our readers, is that popular work, *Downing's Landscape Gardening and Rural Architecture*, which is added a supplement containing about 100 pages, and many beautiful illustrations of Country Houses, Trees, Parks, &c., by HENRY WINTHROP SARGENT. Perhaps no man in the country was so well prepared for the work which he has performed as Mr. S. With a beautiful house and grounds on the Hudson, within sight of the residence of the talented DOWNING, whose intimate friend he was, with fine taste, and an intimate knowledge of all the newest and rarest trees, particularly evergreens, gained from actual experiment, he is, we have no doubt the one Mr. DOWNING, if living, would have selected to do this work, if unable to perform it himself. We have only been able to give an hour to the perusal of the supplement, and thus far it has realized our anticipations. Our readers will be happy to learn that Mr. SARGENT has performed this labor without compensation, and for the sole benefit of Mrs. DOWNING. When we have examined it further, we may say more on the subject. From the Publishers.

MAN AND HIS DWELLING PLACE. An Essay Towards the Interpretation of Nature. Redford: New York 12 mo. pp. 891.

THIS is a mixture of science, philosophy, religion, ethics, reason, and so forth. The object of the book seems to be to prove, otherwise than by revelation, the doctrine of the final happiness of all the human family. The argument is that this world is not a state of trial or probation, as is generally believed, but a school for training and correction, where people are punished for their sins and rewarded for their virtues—all being designed for improvement. That in this world we are dead, and after death we commence to live, and scripture allusions to the death of the wicked refer to the state of death in which we exist here. This is all we can make out of it, after giving all the time we can afford. The author's name is not given, and the reader will be as much troubled to find out what he means as who he is. For sale by DEWEY.

THE ROTASCOPE.—No. III.

BY THOMAS WITMER.

In our preceding article we assumed the wheel to be moving with a velocity that would carry a particle on its outer surface, just equal to the velocity of a falling body towards the center of the earth, during the first second of time of its descent; and we found that the particle C, fig. 5, would (independent of cohesion) be brought to a state of rest, and all the other particles of the wheel would tend to move around that point as a center, bringing the centre I, in the direction I, J. But as the

FIGURE 5.

wheel continues to revolve on its axis, and each particle is incessantly changing its place, this new center of motion is also incessantly changing its place, causing, as before shown, the rotation of the machine around the stand, (see fig. 1, in second article,) with a velocity of, say 4 feet per second.

Now, we will increase the velocity of the wheel, say four times, or to 64 feet per second. The particle C, will no longer be at rest, but will be projected $64\frac{1}{2} - 16 \cdot 12 = 48\frac{1}{2}$ feet in a second, in the direction C, D, while, in the same time, E will be projected $64\frac{1}{2} + 16 \cdot 12 = 80 \cdot 5 \cdot 12$ feet in the direction E, F, while the center of motion will be brought back to F. And the greater the velocity of the wheel around its axis, the nearer will this new center of motion be brought in proximity to I; and the rotation of the machine around the stand, will no longer be 4 feet per second, but less than 4; and, indeed, if the velocity of the wheel, could be increased to infinity, i. e., so that 16 · 12 ft. per second would be as nothing to the velocity given, (which might prove to be a dangerous experiment, as well as a difficult one,) the machine would not rotate at all around the stand, but while revolving on its

FIGURE 6.

axis, would stand perfectly still; gravitation having no power to destroy the "balance of power" between the particles situated on opposite sides of the axis, and moving in opposite directions. Hence, the rotation of the machine around the stand, is very slow when the wheel moves with great velocity, and is accelerated as the velocity of the wheel

is diminished by friction and the resistance of the air. This approximation of the velocity of the machine around the stand, from 4 feet per second down to a state of rest, may be demonstrated by figure 6.

With a velocity of 16 · 12 feet per second, the resultant, as before shown, would be B, E; but if doubled to 32 · 16 feet, the resultant would be B, G, and if increased to 48 feet, the resultant will be B, I; while if quadrupled to 64 feet, it will be B, K, and so on, approximating to B, J, though never able entirely to reach it. It will be readily perceived that the resultants are continually opposing gravitation more and more as the velocity is increased. And the more two forces oppose each other, the less they accomplish towards a common end.

FIGURE 7.

If our theory is correct with regard to the Rotascope, it is rational to suppose that the yearly motion of the earth, in its orbit around the sun, is the resultant of the daily revolution on its axis, and the attraction of the sun, and very much do we regret our want of scientific culture to extend our investigations in that direction, and treat the subject as its importance deserves. We venture a homely opinion, hoping to hear from abler minds on the subject. Let S, (figure 7,) represent the sun, E, the earth revolving on its axis, in the direction indicated by the arrow-heads. This diurnal revolution, (like the motion given to the wheel,) with gravitation of the earth toward the sun, would cause it to move in its orbit in the direction from A to B as a resultant. Likewise a ship, propelled by a single wheel placed at the stern, revolving with its axis parallel to the keel, like our lake propellers, will have tendency to swing the stern sideways, and require the helm to be laid over, to counteract this motion. I am not sure that this is practically true, but hope to hear from some experienced lover of truth on this subject. Let us have facts, and then draw our conclusions from them, and many things which appear mysterious will be found obeying the laws of Nature with due loyalty.

Williamsville, N. Y., 1859.

SPEED OF RAILROAD CARS.

MANY of the accidents which happen to persons attempting to cross railroads are the results of ignorance of the velocity of the iron horse when fairly under way. A writer in the *Hartford Courant* gives some interesting facts which it may be well to bear in mind:

"It seems almost incredible that, as we glide smoothly along, the elegantly furnished car moves nearly twice its length in a second of time—about 74 feet. At this velocity we find that the locomotive driving wheels, six feet in diameter, make four revolutions per second. It is no idle piston-rod that traverses the cylinder eight times per second.

If a man with a horse and carriage should approach and cross the track at a speed of six miles per hour, which would be crossing rapidly, an express train approaching at the moment would move two hundred and fifty-seven feet while he was in the act of crossing a distance barely sufficient to clear the horse and vehicle. If the horse was moving no faster than a walk, as the track is usually crossed, the train would move towards him, while in the act of crossing, more than five hundred feet. This fact accounts for the many accidents at such points. The person driving thinks he may cross because the train is a few rods distant.

How compares the highest speed with the velocity of sound? When the whistle is opened at the eighty rod whistle post, the train will advance nearly one hundred feet before the sound traverses the distance to, and is heard at, the crossings. The velocity exceeds the flight of birds. The late Dr. J. L. Comstock, the well-known author of several philosophical works, informed the writer that he was recently passing through Western New York when the train actually ran down and killed a common hawk. The train was stopped, and the game so rarely captured was secured."

PHYSICAL EDUCATION.—Dr. COX is reported to have said, in a College address:—"I am glad that LUTHER had a good digestion as well as a great soul, for the reformation would have been delayed had he been a dyspeptic." The Reverend Doctor has been a martyr himself to throat-ail, arising from a dyspeptic stomach; and it has been reported to us that his wife is the only person able to keep him well, by always accompanying him and treading on his big toe under the table, to remind him that he had eaten enough, and instantly the plate is obediently pushed back.—*Hall's N.Y. Journal of Health*.

It costs a deal of money to be rich, and it is a question if so much is worth so little? After all, is wealth worth the cost, first in acquiring it, next in supporting it, and lastly, in bearing up under it when you have lost it?—*Punch*

YOUNG RURALIST.

A PLEA FOR DOGS.

Messrs. EDS.—In looking over the pages of the *RURAL*, my eyes very naturally rested upon an article by S. B. B., entitled "A Plea for Dogs," and thinking perhaps I could add an additional mite of testimony in favor of "these gentle dogs," I send you this communication, so that "by the mouth of two or three witnesses every word may be established." Your correspondent starts out with the assertion that "in all ages and in all climes the dog has occupied a conspicuous place among domestic animals," which, so far as my observation extends is strictly true; and if any one entertains a doubt, he can have plenty of demonstrations of the fact that he (the dog, I mean) "has occupied a very conspicuous place among some of the best flocks of sheep in this vicinity. All that would be necessary would be to take a walk over the fields of some of our neighbors in order to convince the most skeptical.

In addition to what my friend says with respect to "the three letters that compose the term (dog) when differently arranged might serve as a gentle hint, &c.," he might have added that the dog possesses one of the good qualities attributed to him thus represented, namely—"he goes about doing good." In proof of this, I will cite a case which recently came under my own observation. Our neighbor over the way, was the owner of a nice flock of *Leicester Sheep*, for which he had paid a large amount of money, (which he ought to have paid out for dogs.) His sheep were increasing so fast that they were likely to eat up all his surplus fodder and convert it into good merchantable wool and mutton, which, when sold, would enable him to lay by a snug little sum each year. The prospect was that unless something was done immediately, our neighbor would soon be ranked among those of whom it was said, "it is easier for a camel to go through the eye of a needle than for them to enter into the Kingdom of Heaven." And, had not our "faithful sentinel" (with his "eloquent tail," "opened his mouth" in behalf of our neighbor, and would have been his situation. But "the noble animal for which we plead," saw the impending danger, and came to the rescue. And the result was, that this morning the mangled carcasses of his choicest sheep were to be seen scattered over his fields. But notwithstanding this exhibition of disinterested benevolence on the part of our mutual friend, some of our neighbors (even the one over the way included,) are so ungrateful as to accuse "the noble animal for which we plead" of prowling about nights and thrusting his carnivorous fangs into the throats of the innocent and unoffending sheep, and sucking out their life-blood. But I intend to silence all such slanderous insinuations in these parts, and if S. B. B. can keep them all straight away down in old Vermont, I think *these dogs* will come out all right yet. W. L. Feltfield, Mich., March, 1859.

FARMING IN OHIO.

EDS. *RURAL*.—The present they bring with it an opportunity to write something relative to our rural homes, and the prospects of the coming season, which, no doubt will prove a fruitful one. I have been anxiously looking to see if the *Young Ruralists* of Ohio would speak out and say something about the present campaign, which farmers are heartily preparing for. Old fences are being torn down, new ones made in their stead, briars and thorns mutilated, and lands, which formerly produced nothing but weeds and grass, are now undergoing a process of underdraining, which will eventually pay the owner three dollars per day.

Sugar Cane is fast becoming a common production in Ohio, and most farmers in my vicinity are fixed upon giving it a thorough trial the coming season, and I, as one, have come to the resolution of putting out at least one acre, in which to test its cultivation. Those who have tried the cultivation of the cane have succeeded tolerably well. One of my neighbors having out a piece of ground in sugar cane, not exceeding in dimensions a common country garden, received from the stalks fifty-one gallons of juice, which, when boiled into sirup, produced seven gallons. *Young Ruralists*, will this not pay? Let us, then, put forth our strongest efforts to see who can produce the most sirup from the least portion of ground. S. C. ROACH. Paris, Stark Co., Ohio, 1859.

HENS, PRAIRIE CHICKENS AND CHILBLAINS.

Messrs. EDS.—As father and I take the *RURAL*, I wish to ask a few simple questions through its columns. What is the best and cheapest food to feed hens to make them lay in the winter? I keep them in a warm coop and let them out every afternoon. I feed them plenty of hulled buckwheat and fresh meat. I keep plenty of coal, gravel, and lime in the coop. Two-thirds of them are half-Shanghaes and the rest full-blood Bragons. The number of eggs that I get ranges from three to five a day, from two dozen hens. Will any one give a non-laying remedy?

Will some one give me the best plan to make a trap to catch prairie hens? The one that I have is four boards nailed together, in the form of a box, with slate across the top. I set it with a figure four. I never catch but one at a time, and, as they are very shy, my hauls are few and far between.

What will cure chilblains? As I am troubled with them, I wish to know. F. L. Springport, Mich., 1859.

We cannot tell why your fowls do not lay better in the winter. We find early spring chickens lay better in the winter than either old hens or late chickens. Ascertain which hens lay, and this fact may be of service to you another season. Perhaps they are confined in too small and close a house. It would be well to change their feed. Try a few experiments in this way. The best way to trap prairie chickens we must leave for our young readers in the West. Turpentine is said to be an excellent remedy for chilblains, if well rubbed in, but we cannot speak from experience.

ILLINOIS LANDS FOR SALE.—The subscriber offers for sale, at low prices and on accommodating

Situated in Central Illinois, in the counties of
Montgomery, Christian, Shelby, Macon,

Small lands were mostly selected and sold out in an early day, and are very choice selections of Rolling Prairie or valuable Improved Parks. Many of small lots are in back of large lots, and all situated within convenient distances of highways.

Small lots are offered for sale in small parcels to actual buyers on reasonable terms, or will be sold in large parcels at wholesale prices on very accommodating terms. The titles are perfect, and all conveyances will be made by warranty deed. Also,

400 TOWN LOTS!

Very eligibly situated on U.S. Grant & P.A.N.I., being ad-
joining the U.S. Grant & P.A.N.I. Terr. Home.

Persons wishing to purchase, write to the above-named

THORPE'S CHURN AND BITTER-WORKER,
Patented Sept. 24, 1896.—This Churn, that stands out
utterly thorough, as it is taken out of the churn, saving
fully one-half of the labor. State and County Rights for sale.
Address: FRANKLIN THORPE, Springfield, Ill.

[SINGLE NO. FOUR CENTS.]

VOL. X. NO. 15.]

ROCHESTER, N. Y.,—FOR THE WEEK ENDING SATURDAY, APRIL 9, 1859.

{WHOLE NO. 483.

MOORE'S RURAL NEW-YORKER,

RURAL, LITERARY AND FAMILY NEWSPAPER.

CONDUCTED BY D. D. T. MOORE,
With an Able Corps of Assistants and Contributors.

TERMS IN ADVANCE:

TWO DOLLARS A YEAR—\$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for \$5; Six, and one free to club agent, for \$10; Ten, and one free, for \$15; Sixteen, and one free, for \$22; Twenty, and one free, for \$30; Thirty two, and two free, for \$40; (for Thirty for \$37.50.) and any greater number at same rate—only \$1.25 per copy—with an extra copy for every Ten Subscribers over Thirty. Club papers sent to different Post-offices, if desired. As we pay American postage on papers sent to the British Provinces, our Canadian agents and friends must add 12½ cents per copy to the club rates of the RURAL. The lowest price of copies sent to Europe, &c., is \$2.50—Including postage.

THIS PAPER ON THE RURAL is only 3½ cents per quarter for any part of this State, and 5½ cts. to any other State, if paid quarterly in advance at the post-office where received.

All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

SEASONABLE HINTS AND SUGGESTIONS.

Now that the RURAL CAMPAIGN has fairly opened—the season having arrived for active operations in Field, Orchard and Garden—permit us, friendly reader, to take you by the sleeve, and have access to your ear, a few moments, while we talk plainly and suggestively, if not wisely, about preparing for, as well as performing, the various important labors of Spring and Summer.

First, let every farmer decide, in view of all the circumstances, what he had better do and what he can best leave undone. It often happens at the end of the year that we discover our programme covered too much ground. We attempt what, with our means, can be imperfectly accomplished, and what, consequently, "costs more than it comes to."

Having decided what to do, fix upon the most appropriate time for doing it—for every thing has its time, as it should have its place. The time for planting, hoeing and harvesting is fixed—each crop having its season will accept of no other. There are many other things that can be done when it is most convenient to attend to them; these, as a general rule, should be assigned to the winter and early spring, when vegetation is at rest.

Let every farmer make out an inventory of work to be accomplished during the year, allotting each item to its appropriate season. Having done this, let him be sure and "come in on time." Do not allow one branch of business to intrude on the domain of another, on any consideration whatever. If the requisite help or facilities are wanting to accomplish this or that operation, procure additional aid or resources that by some means the end may be attained. Let the thing be done in the time allotted to it; no procrastination should be allowed—no delay tolerated—no respite granted. In multitudes of cases crops pay nothing because they are attended to a little too late. Work done to a disadvantage had generally better be left undone. If a farmer gets a little behind in the outset, one thing will crowd another out of place from the beginning to the end of the year, and there will be continued trouble, disappointment and loss; whereas if he had taken time by the forelock—had got a good start—he might have kept in advance and made a profit on every item of labor and capital invested. To use a plain illustration—if fencing runs into the time allotted to picking up stones, and picking up stones uses up the period assigned to getting out manure, getting out the manure will delay the plowing, and so on to the end of the chapter—one thing displacing another through the entire season, and finally crowding out what ought not and should not be omitted.

That "Procrastination is the Thief of Time" is a trite adage, but its truth cannot too often be impressed upon the mind. Every farmer should be fully "up to time" in all his labors—and especially in preparing for the various operations of the season. Fields cannot be cultivated (under the American system,) until they are fenced, nor implements used to advantage unless they are in proper order. Indeed, there are many matters, often neglected by farmers entirely, or until too late, which are almost as requisite to his success as are type and paper to us in printing the RURAL. We therefore enjoin all to "make ready" in season, to avoid waste of ammunition, or a "flash in the pan" when the word "fire" is pronounced.

Are your implements, fences, teams, &c., in order for the practical campaign of Spring and Summer? The plows, harrows, cultivators, and also the heavy machinery—such as drills, mowers, reapers, etc.,—ought each and all to be seen to, and repaired if necessary, before the day or week arrives when they are to be used. "Time is money," and those who take it by the forelock in these matters, make wise investments—such as will yield large dividends at the proper time. No cultivator can afford to be slack, and behind his work, when all Nature is laboring so vigorously, and generally in his behalf—except what she does in growing weeds, thistles, &c. Get all the implements ready—have your teams in good heart—let every fence be "righted," and don't neglect to substitute as many good gates as possible in place of those warping bars to progress.

Procure the best Seeds, and plant them well, in properly prepared soil. Always "propagate from the best," whether grains, roots, plants, trees or domestic animals. The best specimens of the best varieties and breeds should be the object—but don't deplete your purses in obtaining new things (or old things with new names) unless you are satisfied the investment will pay. It won't do, for instance, to pay \$9 a bushel for what is fancifully labeled "Honey Blade Hungarian Grass," when you can get the same or as good an article (under the old name of Hungarian Grass) for \$3. Remember the days of Rohan potatoes, Morus Multicaulis, China Tree Corn, &c., and "look before you leap," lest you "pay too dear for the whistle." The best course is to try new things on a small scale, and for main crops obtain good seed of the best proved and approved varieties of vegetables, grains, &c., and don't forget to introduce your cow to the best male bovine within reach.

Good Pastures and Meadows are important essentials to success in farming throughout a great portion of the country. The people of Western New York, especially, ought to give this branch of husbandry increased attention; indeed, they ought, in vulgar parlance, to have "gone to grass" years ago—for Grass is one of the main institutions which must prove their salvation. Yet how few pastures and meadows receive any attention after seeding, even in the best cultivated sections! How many farmers use the harrow, and apply plaster, or any other fertilizer, to their sod-bound pastures and meadows?—though the necessity is apparent, and the benefit great. Few farmers, we opine, are aware of the great difference in the quality of grass—though their stock, and the quality of much of the butter produced, is a good indicator, or grass-ometer. But we can only give a hint on the subject, having no space to amplify. Read the sensible and suggestive article of H. T. B. about Grass.

The Orchard and Garden are reasonable topics not only, but require early attention. No farm, or homestead, is complete without these valuable adjuncts, and the more attention they receive at this season of the year, the more profitable and ornamental will they become. As to how they should be managed, doth not our Horticultural Department tell from week to week?—posting both amateur and professional cultivators of Fruits, Vegetables, Flowers, &c., as to modes of culture, varieties, &c.?

ABOUT GRASS.

CULTIVATE GRASS. By all means cultivate grass, plow less, and "seed down more." It would seem as though the most indispensable and beneficent agents were least thought of—how much attention do we give to light, air, water, and other things that seem to come as a matter of course? Happily, grass is beginning to be considered. Its universality, its indigenous character, its wide adaptation, its hardness, the economy of its production, all point to it as a leader in agriculture. Its capacities have not been fully tested, and are not fully known.

The quality of grass depends essentially on the character and quality of the soil upon which it is grown, and in general is susceptible of great improvement. Grass upon mere vegetable mold, lacks "heart," as it is popularly expressed. It has not those mineral and other ingredients that give it substance and healthy vitality. Land of a light "mucky" character may be very profitably manured with gravel and loamy soil—Christian charity, not less than "progress and improvement," would dictate that needy laborers, with no winter business, should to some extent find employment in regulating the soils. Strong clays do not produce the best grass, either in quality or amount, and could be improved in the same way.

The popular verdict—and there is never an appeal from that, when deliberately rendered, for it is the aggregate of human experience—is in favor of upland hay, but it is worthy of consideration whether the same conditions cannot be essentially realized,

and similar results obtained on lower land. There is, fortunately, a large variety of grasses, suited to different conditions and qualities of soil. Valuable things have been found out since the deluge, and it may be that we, here in America, may find out grasses better adapted to our necessities than those generally cultivated.

Of the prevailing varieties, Timothy stands first. Clover, cut early, makes excellent hay, but is inferior for pasture, and does not last long, though it is well adapted to light, dry soils, and is invaluable as a fertilizer. Red Top is well adapted to wet land, and as there is a good deal of such that will not get drained right away, though it needs it ever so much, this variety of grass should be propagated with more care;—its seed is seldom offered for sale, and there appears to be little care in saving it.

June Grass is not considered respectable, but "it comes in itself," and covers many an acre in the skirts of the woodland, by the road-side, and in the open field that would never be seeded except on the "voluntary principle." Under favorable circumstances it makes a very good growth, and is valuable as early feed. Where it predominates in meadows, it should be cut by about the middle of June, or as soon as the seed is formed, and it makes exceedingly nutritious hay.

How to get "a good catch," and a good and permanent growth afterwards, is second in importance to no other agricultural interest. Agitation should follow agitation on this subject in ceaseless succession. One-half of the meadows and pastures of America produce less than half the grass which they are capable of producing. They either never were properly seeded, or they are "bound down" and "run out"—they need renewing. An Englishman said to the British Parliament, "the American Colonies grow by your neglect;" if so, they look pattern from grass, which seldom grows any other way. Neglect is what it feeds on. A dressing of plaster, ashes, manure or earth, once in a year or two, with an occasional harrowing, would be of essential service—but neglect is the motto.—That stream which flows by freighted with fertilizing agents, might be spread over the grassfield, in some cases, with little expense, and generally with incalculable benefit—neglect is the policy. Gnawed bare in the fall and winter, and trampled to death in the soft season of spring, it yields to inevitable fate.

But the difficulty generally begins sooner. It is strangled to death in its birth. As if it were a mere adjunct of something else, and worthy of no distinct or decent consideration, the seed which is expected to produce it, is buried deep or left uncovered, to grow feebly with some overshadowing crop. Grass seed should be sown early in Spring, or early in Autumn, on well pulverized and prepared land in good heart, covered lightly, and either sown alone or sown with wheat, rye, or barley—the wheat, &c., being sown very thin, and the grass quite thick, say eight or ten quarts to the acre.

We can never do well in farming, till we learn to seed land down with the first or second crop, and when the stumps and roots are out of the way plow under a good turf. The cheapest way to enrich land, raise a root or grain crop or two, and then seed down for two or three years, taking care of it when seeded.—H. T. B.

PASTURING IN THE HIGHWAY.

Messrs. Eds.—I wish to subscribe to the doctrine advanced by S. E. T., of Lake Ridge, in the RURAL of the 12th ult., in regard to obstructions in the highway, although in certain instances I shall have to plead guilty of the violation of them to some extent. May I not, however, be allowed to approve of a doctrine or principle, which I do not practice in full, and then be found in tolerable good company? His article is very good as far as it goes. I agree with him that the "highway belongs to the traveling public," but can see no great impropriety in piling up old sleds, wagons and other implements, by the road-side, than in turning loose a whole stock of cattle, sheep, horses and hogs upon it, to cke out a slender subsistence, and be a source of continual annoyance to the community in which such pernicious habit is practiced.

Domestic animals turned loose in the road for pasture, are as much, if not even more, of a nuisance, as any obstruction of an inanimate character upon the way-side, which you may choose to mention. "Pasturing in the road," as it is called, probably originated in the necessity which some poor people have felt for turning a cow into the road to feed, not being able to pay for pasturing, and feeling also unable to dispense with the use of one; or, perhaps, when the country was new, and scarce any inclosures were made. But, be its origin what it may, it is enough that in this section of our "Empire State" the custom is quite prevalent, not only with those who own no land, and are poor,

BLACK HAWK HORSE "PHILIP ALLEN."

Above we give a portrait of the celebrated Black Hawk Stallion "Philip Allen." The portrait is said to be a very accurate and life-like one, with the exception of the head, which is smaller and far more perfect than here represented.

Philip Allen is the property of Messrs. ASHLEY & BROTHERS, of Nunda, Liv. Co., N. Y., who purchased him last December for \$2,000, and purpose to keep him for breeding purposes. He is six years old—bred by HERMAN PECK, of West Cornwall, Vt. Sired by DAVID HILL's celebrated Vermont Black Hawk. Dam, Lady Morgan, sired by Bulrush, and he by the original Justin Morgan;

but with some also, who have farms, (farms paid for, too,) fields of waving grain, and land well adapted to grazing.

Now, I consider this practice absolutely, utterly unjustifiable. It is easy to conceive of some excuse for the man that is poor, and has no land, but a family whose support is dependent upon his daily labor,—indeed we should vote it no great crime were he to turn his cow into our "long pasture,"—but even then we must be allowed the opinion that, peculiarly, it would be of no profit or advantage to him; for the time spent in looking her up, driving her home, &c., would, if employed in some useful labor, more than pay the expense of pasturing, to say nothing of the increased quantity and quality of milk, and her improved condition. But, for the man who owns a farm, and has land well calculated for grazing, there can be no excuse whatever. He is in fact guilty of a misdemeanor—an outrage upon his neighbors, whose peace and quiet he contributes to destroy—an offence against community at large.

I care not in how good repair fences are kept, in a section where this habit is practiced to any considerable extent, it will be a source of great annoyance, trouble, and litigation. A drove of famished creatures, which have eaten every spear of grass, and even weeds, attainable within the bounds of the road, driven almost to desperation by hunger, will not let a common post and board or rail fence deprive them of the luxuries from which it only separates them. Man will do almost anything to satisfy the cravings of hunger; can less be expected of beasts? What is more provoking, in the busy season, than to have a herd of cattle or hogs break into your meadow or grain fields, and make such horrible work as they only can make?—And then the poor beasts; ten chances to one if they are not dogged until they are nearly exhausted from fatigue and excitement, when not they, but their owners are to blame. Then, perhaps, a lawsuit follows; and money enough is paid for damages to cattle, or for trespass, and perhaps both, to more than pay for pasturing them a whole season.

The practice tends to develop the mischievous faculties, and render animals unruly, restless, and roving in their habits and dispositions—also lean and lank in condition. Indeed, it appears to me that if profit is the object (and what else can be?) in stock raising, much more would be made by keeping cattle in good pastures, and giving them good care and attention; and certainly all who have any respect for their neighbors, will not persist in the practice of "pasturing in the road."

Much more might be said, and I could not say less upon the subject; but as "brevity" is your motto, I will close with the hope that some day, not far distant, the custom will become obsolete. FIDMORE, ALLEN & CO., N. Y., 1859. J. S. M.

grand dam by a son of old American Eclipse.—Color, bay brown—15½ hands high—weighs 1,050 lbs. Philip Allen is a half brother of Ethan Allen, also of Lancelot, and partakes of the style and speed of those celebrated trotters. He has made 2.44 on a half mile track, and his owners claim that in perfectness of form and style and speed, combined, he surpasses any trotting stallion extant.

We congratulate the farmers of Livingston and adjoining counties upon this valuable accession to their breeding stock, and have no doubt Philip Allen will be appreciated by those who believe in propagating from the best.

TREATMENT OF MILCH COWS.

FRIEND RURAL:—Being confined to the house by indisposition, I am inclined to think of my friends, hence you come in for a share.

During the year past many have been the inquiries and answers in your columns in relation to cows, and the best mode of treatment, so as to prevent their having caked bags. Taking it for granted that some people are yet milking some of their cows, I would say to them that, in drying off your cow, do it not in a careless manner, but take the milk away once in twenty-four hours, for several days, then on each alternate day, and then on every third or fourth day, until the bag is thoroughly wilted. In this case there will be no fever in the bag, hence no matured milk,—neither strings nor slugs. Now then, you will have the glands of the udder in a healthy condition; and now to keep it so. Your cow is to pass through an important stage to calving time. I do not care in how high condition you keep your cow, by feeding hay, stalks, straw, roots, shorts, &c.; but she should not be fed to a high condition of flesh with corn when in calf and giving no milk, as I deem corn too hot and feverish for the blood under such circumstances, the cow giving no milk for relief.

When the time arrives for a cow to "make or spring bag," you may observe her milk vessels enlarge and swell, and if her blood is not in a healthy condition there will be more or less fever in the milk ducts and glands, which become tender and sore, causing the animal to flinch when milked and sometimes kick; and if the bag is not properly cleared, fever is followed by inflammation, and then the caked bag is apt to be the natural consequence. My method, which is founded on experience, is to feed the cows, during the four weeks in which she is springing bag, about four ounces of saltpetre, in say, eight different meals of slop made of bran or ground oats. Dissolve your saltpetre in hot water, pour it on your mash and mix thoroughly. This treatment will purge all impurities from the cow's blood, which will much diminish the liability to caked bag.

With your permission, a few remarks about how to treat a cow after calving. Firstly, take away about one-half or two-thirds of her milk, and give it to her before you feed her anything else. She will take it down greedily, but not meddle with milk afterwards. The calf must take the balance. By all means, allow her to eat her own cleaning—and then, with other treatment all right, your cow is in fair condition to do well.

I write both from observation and experience, having years ago kept a small dairy with fair profit and success in the renowned dairy county of old Herkimer. C. W. P. Phelps, N. Y., 1859.

DEEP FLOWING—FLOWING UNDER CLOVER.

EDS. RURAL:—I am sometimes at a loss to account for the difference of opinions of good practical farmers in reference to deep plowing. Some contend that it is productive of no good to the growth of crops; others, that it is well enough once in three or four years, but not oftener, while some argue, with greater show of plausible logic, that deep plowing not only deepens and loosens up the soil, enabling the roots of plants to run deeper and spread to a greater length, thereby drawing a greater amount of nourishment from the soil, and from the atmosphere, for which a mellow, deep soil—which is always moist—has a stronger affinity; but it brings near the surface, and within the reach of the roots and fibres of plants, those mineral elements which enter into the growth and composition of all vegetation—which not having been stirred, by former deep cultivation, has lain in an inert state, in the hard impervious subsoil. I can account for this difference of opinion on no better hypothesis than this, that it depends very much upon the soil, and more on the subsoil, of the particular locality or farm which a farmer cultivates, as it regards the opinions or conclusions they arrive at, than any error of judgment or opinions that they may form.

Farmers are indebted about as much to the experience and opinions of their neighbors working similar soils, as they are to their own personal experience for the conclusions they come to, or the opinions they form. A section of country composed of light soil, with a loose gravelly subsoil, and as is often the case, a subsoil of quicksand, could not be plowed deep without material loss to the cultivator. Farmers working such soils, would soon find that it would be very injurious to plow very deep, and not being acquainted with soils having a tenacious subsoil, would be very apt to condemn deep cultivation on all soils. While others, living in a different locality, where deep plowing had proved beneficial, would be quite as likely to recommend deep cultivation on every variety of soil. It therefore becomes important that every farmer should understand the nature of different soils, and knowing when to plow deep, or when shallow, his own good judgment will determine what course to pursue, or recommend to others. So far as my experience and observation goes, I would not be in favor of very deep plowing where the previous cultivation had been shallow, unless it was plowed in the fall; what I call deep plowing is from nine to twelve inches deep. If plowed in the spring, for a spring crop, and to the above depth, it would, in my opinion, unless previously cultivated nearly as deep, prove very injurious to the productiveness of that crop, particularly corn. All spring plowing for corn should not, in my judgment, be over seven or eight inches deep. I am decidedly in favor of deep plowing; but in all cases when plowed to an unusual depth, it should be done in the fall.

A subsoil that has never been stirred does not seem fitted to promote the growth of vegetation, unless it has been exposed to the ameliorating influence of winter's frost, and summer's heat and moisture. I have known instances where ground had been plowed deep and well, in the spring, for corn, and given but poor returns, and where a similar soil, on an adjoining field, had been shallow and poorly plowed, yielding much the larger crop. I have also known ground plowed in the summer, very deep, for wheat, where the yield was considerably diminished in consequence, but proved of decided advantage to the future fertility and productiveness of the soil—producing all kinds of grain, clover, and grass, equal if not superior to most farms in the neighborhood, which had formerly a much higher reputation. If the former cultivation had been poor and shallow, I think it would prove injurious to turn up too much of the subsoil at one time; but increase the depth, at each subsequent plowing, until you have as deep a soil as desirable. Deep plowing will be found to answer better for fall than spring crops, but for all crops, more beneficial if plowed the fall previous. I have seen very apparent results in bringing impoverished and worn out lands to a high state of productiveness, by plowing under clover when in full bloom, or nearly matured, and before it was much dried. It is in fact, I believe, the cheapest and best renovator at hand on worn out or exhausted soils—on extensive farms—as it seems to restore the very properties that the soil most requires.

I have known farms that would not produce over ten or fifteen bushels of wheat to the acre, restored to a good state of fertility by turning under a heavy growth of clover. From puny yellow straw, as it grew heretofore, it grew rank and dark colored; yielding from thirty to thirty-five bushels per acre of good merchantable wheat. This system of cultivation does not admit of but once plowing, which should not be either too deep or too shallow, but thoroughly cultivated and brought to a fine tilth by the harrow, cultivator, or gang-plow, which cultivation should not interfere with the sod. The best practical proof against turning under clover deep, was when I did not plow over seven or eight inches in depth, not that I thought it most beneficial to do so, but having a small plow, and the ground being very dry and hard, and the clover large, I could not plow deep. Yet I never experienced such marked results, from turning under clover, before or since. My theory is, if clover is turned under too deep, decomposition does not take place so effectually, because it is not sufficiently near the surface to be subjected to the influences of air, light, heat and moisture, which are essential not only to decomposition, but to assimilate its fertilizing properties to the growth of plants. Neither too shallow, for the roots of plants would not have sufficient depth of loose, mellow soil, to draw sufficient support for their vigorous growth.

Now, theory is worth but little unless it can be substantiated, and fully sustained by practice, and before any man promulgates his opinions, he should be well assured by positive, practical knowledge, that his theories are correct.

Wheatland, N. Y., Jan. 1, 1890.

As the season for harrowing and rolling winter wheat is again at hand, we would remind those interested that it is a safe and beneficial process, according to the testimony of experienced farmers given in former volumes of the RURAL.

CULTURE OF DIFFERENT SOILS.

EDS. RURAL:—As Michigan is noted for its many varieties of soil, I thought I would give you my views on the cultivation of these soils. Where a farm contains several kinds of soil, there should be different modes of culture, as well as different kinds of grain sown and planted. If this rule be closely observed, it will pay a large per cent. on the time invested. You will learn something of the necessities of different fields, and of the different soils which compose these fields. Is there any difference between clay, black loam, or light sandy soil? Is a different treatment necessary? If so, why operate on a single field in which there is a great variety of soils, in precisely the same manner on all its parts? Farmers, some of you do this very thing. Suppose your horses were sick—one having the distemper, the other a fresh cut; would you make the one application cure both? I think not; as there are two different diseases, you would use two remedies. Different kinds of soil must likewise have different treatment. I have many different kinds on my farm. I have my fences so arranged that they divide the different kinds of soil as near as possible; my fields are small, ranging from five to ten acres in a field, which I think is better than to have them larger, with two or three kinds of soil in one lot, and the same number of varieties of grain. I prefer small fields to large ones, on account of stock; stock in a large pasture run over the food, and destroy as much as they eat.

I will call your attention to lot No. 1, a black loamy soil. The best crops for this soil are corn, potatoes, grass, barley, oats, and spring wheat. For the three last mentioned, I should prefer fall plowing. This soil is of a very rich nature, and will endure more cropping, with much less manuring, than other soils which I am about to mention. Lot No. 2, Clay soil. This a good soil if well managed; will grow winter wheat, grass, oats and barley. This soil requires a large amount of hard labor, with considerable fall plowing, to keep the soil loose and mellow. It should be seeded with clover as often as once in three years, and a full crop plowed under to keep the soil in good condition for cropping. Lot No. 3, A light sandy soil. Is very easy tilled, and will produce most every kind of crop if rightly managed. If your soil is poor, seed with clover, at least ten pounds to the acre; after the clover comes up, sow one and a half bushels of plaster to the acre. When the clover gets in blossom, plow the crop well under, and when grass makes its appearance, cultivate it in, and you may expect a good reward for your labor.

Paris, Kent Co., Mich.

MANAGEMENT OF BEES.

THE atmospheric changes alluded to in a former communication must be traceable to some cause. Can that cause be traced to man himself? Much has been published in the *Tribune*, and other journals, lately, deploring the injudicious destruction of the primitive forests, by the sturdy pioneers of all our new settlements, and of the climatic effects produced by the denuding of the land of trees. That a change has been produced is a fact any intelligent observer need not dispute. But what has this fact to do with the habits and instinct of bees? Let us see. In conversation with neighboring farmers, they agree that the grasses have been very much injured of late years by frost-killing or leaving. Among the grasses is white clover, the main dependence of bees from which they gather honey, and this grass is injured with the others, and is yearly diminishing in amount and luxuriance. The chilling blasts sweep over our hills and valleys without let, hindrance or impediment from belts, or groves of trees wisely selected and left for protection. The results are disastrous to the farmer as well as to the apianian. Without a change for the better in atmospheric influences and quantity of bee pasturage the prospects for the future to the apianian, who wishes to cultivate bees for profit, are rather gloomy—in common parlance, "bees will run out," as a general thing, in this elevated region. To obtain large apiaries, this is not a favorable country I am well convinced from many years' experience—successful bee-keeping here is a failure, not only in my case, but a failure universal.

Perhaps some method of managing bees may be discovered or suggested that may in part, or wholly, obviate the difficulties complained of. This, however, is a problem yet to be solved. I wish that others would give their experiences and suggestions through the columns of the RURAL on bee-culture.

Apiary Cottage, Cal. Co., N. Y., 1890.

VALUE OF HEN MANURE.

MESSES. EDS.:—Noticing in the last RURAL an article upon hen manure, I submit my experience in regard to its use and value. Many years ago the idea suggested itself to me that the manure from hens could be turned to some account, and as agricultural papers talked much of the value of guano, I thought I would try what could be done with an artificial article. At the time I had about twenty bushels of hen droppings deposited on the floor of my hen house, which I took and added to a like quantity of unleached ashes, with ten bushels of Cayuga plaster; mixed the whole thoroughly together, being careful to powder the manure, then gathered the whole in one corner of my barn and covered the pile with my horse blankets, that the air might be excluded as much as possible. When the mass had become sufficiently fermented, I laid out my corn ground and commenced planting, employing a boy or boys to follow the droppers with the guano, applying about half a gill to each hill, which was immediately covered with the hoe. The result was that upon ground which would not in the ordinary mode of treatment yield over thirty bushels per acre, I received fifty bushels of good, sound corn to the acre. I tried the experiment upon potatoes and wheat, upon a small scale, with equal success.

I am of the opinion that the droppings of each hen kept on a farm, if properly saved and applied, will produce twice the amount of grain that she will consume through the winter.

Corunda, Mich., 1890.

RICHARD P. CLARE.

THAT "SUGGESTED PLOW" IN THE FIELD!

PERHAPS YOUR STAR correspondent from Trompsburg, N. Y., may be pleased to learn that the "new sort of Plow" he suggests has been more than suggested in old Genesee. I refer to BAINBRIDGE'S Subsoiler—an attachment to the surface plow. A number of them were manufactured at Batavia, last season—but, as Mr. B. is out of the business just now, I do not know that any are ready for this spring's demand. He owns the patent and patterns, and can give what "further information" may be desired.

The implement is a simple and practical one—accomplishing just what Mr. "B." desires—capable of being gauged at any depth below the surface plow, from one inch to eighteen—and, attached to one of Mr. B.'s plows, it will subsoil and turn a surface furrow with less strength of team to perform both operations at once than would be required to run a subsoil plow, alone, to the same depth! It is very light, and performs the work with the least possible resistance from the soil. Last season, an extensive farmer said, "I would take one of these, but I fear I shall break it." Says Mr. B., "You can take one home, put it in the worst spot you have, with your yoke of oxen and two span of horses, drive plow to the beam and the subsoiler to the bottom (22 inches), and if in two days you break it, you break my plow!" He tried it, and made an enthusiastic report at the end of the two days—with an appendix in the fall, to the effect that where that plow ran his crop was doubled. It did "prove a desideratum in the culture of corn," and other crops too.

Attica, N. Y., 1890.

HOW TO MAKE HENS LAY.

MR. MOORE:—Among other inquiries in your paper of April 2d, I notice one asking how to make hens lay, and as I am somewhat posted in regard to hens and eggs, I will give you my mode, founded upon an experience of about five years. Up to that time I was like the Mich. subscriber, anxiously inquiring of every one how to make hens lay, as I generally kept about fifty, and would get just eggs enough for a man and his wife, if they both had the dyspepsia, for which, as all Doctors admit, there is nothing so bad as eggs.

Five years ago I killed off all of the old stock, bought twelve Brahmas, built a hen-house 12 by 20 feet with an out-door yard; in cold weather confined the hens, but when not too severe let them out. Whitewash the house once a year; this keeps it free from lice. In regard to feed, many labor under a mistake; they feed too much. To keep twenty hens through the winter give, say six ears corn and two quarts oats or buckwheat per day, about twice a week; also, give them shorts or bran wet with warm sour milk, if you have it—if not, wet with warm water; make it quite wet, and put in a large spoonful of black pepper. Give them all the green stuff you can get, such as cabbage leaves, apple parings, &c. Every fall I kill off the old hens, and save the earliest chickens. Change your roosters every spring.

Since I have adopted this course, I have plenty of nice fresh eggs from twenty hens. Even in the coldest weather I have from ten to fifteen eggs daily. Hens, like cattle and horses, will do better with good care. People generally think they have no business to be hens, and let them take their chances.

A. COLVIN.

Henrietta, N. Y., April, 1890.

A SPICY LETTER FROM IOWA.

EDS. RURAL:—Your valuable paper reaches me regularly, and I think it is appreciated.

Land in this section of the country has been considered too valuable to cultivate—more money could be made by buying and selling it. But I am happy to say many have had "a change come over the spirit of their dreams." Land has depreciated in value, real estate has "taken a tumble," and we have learned the simple fact that lazy, unprincipled speculators, shiftless young men, and Union prayer meetings, never has, and never can develop and "save" a new country. What we want is intelligent industry. "Faith without works," died a miserable death long ago.

We have piled up brick and stone on corner lots, but the improving of land, and cultivation of fruits, we have sadly neglected. I do not wish to have it understood that we have entirely neglected this, out, as the boys say, "we have come so near to it there is no fun in it." If there are people anywhere who can see their past errors, we are the ones; and we are bound to retrieve.

If you have any more young men without means, and who are too lazy to work, tell them this is the "doomed city" for all such. But if they are honest, intelligent and industrious, (with a little capital,) this country is the paradise they seek. "It flows (not overflows) with milk and honey"—at five cents per quart, and twenty cents per pound. Come out and help supply our markets.

I shall probably set out about ten acres to small fruit the coming season, and shall want to ask some questions in my next letter. Yours Truly,

Keokuk, Iowa, 1890.

COWS HOLDING THEIR MILK.

EDS. RURAL:—In a January number of your valuable paper I noticed a few remarks by DANIEL B. HADLEY relative to "cows holding up their milk," and his remedy for the same, by milking "with one hand at a time." "This," he says, "may seem trivial of itself," and so it seemed to me; but as I had two just such cows, I concluded to try it. And I did so, and not without effect—for after stripping them several times, I was nearly discouraged of ever succeeding until the calves had first been gratified. Upon seeing what he had written, and doing as directed, I was well pleased with the result. I conquered. Let me take this opportunity of returning to him my hearty thanks for his useful information. I would recommend to all who keep such cows, and wish to raise the calves, to try this simple plan of imitating the calf as nearly as possible by "milking with one hand at a time" before giving up their attempts as fruitless. Two or three times milking in this manner, will be sufficient, in most cases, to break them of their habit.

—E. L. ARMSTRONG, Southern Wisconsin, 1890.

Rural Spirit of the Press.

The Robin.—Shall he be Killed?

At a meeting of the Massachusetts Horticultural Society, early in 1886, a resolution was introduced authorizing the President of that Society to petition the Legislature for a repeal of the laws prohibiting the killing and destroying of the robin. This motion was laid on the table, but a Committee was appointed to investigate and learn the habits of the robin, and report. The Committee reported the present spring. We give in brief the results of the Committee's investigations as reported by its Chairman, Prof. J. W. P. JENAS, and found in the Society's Journal:

1st. Early in March numbers of this bird made their appearance in this vicinity; but until the second week in April, only the male birds.

2d. The gizzards of those killed in the morning, were, as a rule, either entirely empty, or but partially distended with food, well macerated; while those killed in the latter part of the day were as uniformly filled with food freshly taken.

3d. From the almost daily examination of their gizzards, from the early part of March to the first of May, not a particle of vegetable matter was found in the gizzard of a single bird. On the contrary, insects in great variety, both as to number and kind, as well as in every variety of condition as to growth and development, were the sole food.

But nine-tenths of the aggregate mass of food thus collected during this period consisted of one kind of larva, which through the aid of Baron Osten-sacken, Secretary of the Russian Legation at Washington, I was enabled to identify as the Bibio albipennis, Say, and whose history and habits, by the aid of Dr. Asa Fitch, Entomologist of the New York State Agricultural Society, I was enabled to make out quite satisfactorily. From one to two hundred of this larva were frequently taken from a single gizzard, all in fresh, unmacerated condition; and usually, when this larva was found, it was the only food in the stomach.

4th. During the month of May, the Bibio larva entirely disappeared from the gizzards, but, up to the 21st of June, was replaced by a variety of insects or worms only, including spiders, caterpillars and beetles of the family Elateridae, the parents of the well-known wire-worms, so destructive to corn and various other seeds when committed to the ground. The earth-worm I found to be a favorite food for the young bird, but sparingly employed by the adult for its own use.

5th. From the date of June 21st, I began to find strawberries, cherries and pulpy fruit generally, but in a majority of the examinations intermingled with insects, which led me to conclude that they were not fond of an exclusively vegetable diet, but rather adopted it as a dessert, and from the ease of procuring it, particularly during the enervating season of moulting. At this season of the year, I discovered a marked difference in the food of the birds killed near or in the village and those killed in the country at a distance from gardens and fruit trees, the latter having less of stone fruit and more of insects in their gizzards, which led me to conclude that the robin is not an extensive forager.

6th. The mixed diet of the robin seems to continue from the ripening of the strawberries and cherries to October, the vegetable portion consisting during August and September, in great part of elderberries (*Sambucus canadensis*) and pokeberries (*Phytolacca decandra*).

7th. During the month of October the vegetable diet is wholly discarded, and its place supplied by grasshoppers and orthopterous insects generally.

8th. Early in November the robin migrates southward—the few remaining eking out a miserable existence during the winter months, on bay berries, (*Myrica cerifera*), privet berries (*Ligustrum vulgare*), and juniper berries (*Juniperus communis*).

Potato Planting.
Hon. A. B. DICKINSON, of Steuben Co., this State, furnishes the New York Tribune with the following mode of preventing the potato rot:—"Cut each potato so as to leave but two eyes on each piece, and make that piece as thin as is practicable without injuring the chit or set. If you plant in drills, put these pieces twelve inches apart; if in hills, put three in a hill. Of course, the core of the potato—three-fourths of its bulk, if a large one—is left to be eaten or otherwise disposed of. By this mode the seed goes far, and, should it attempt to rot, it can do comparatively little harm. A large, whole potato will send up larger and more vigorous stalks, but will give no ampler yield. As a further preventive against rot, Mr. D. gives his potato and most other seeds a thin coating of tar, applied as follows:—Pour a pint of tar into ten gallons of boiling water, and stir till thoroughly dissolved. Soak five bushels of potato seed, cut as already indicated, in this tar-water. Now roll in plaster, taking up as much of it as possible, and your seed is ready for planting."

EFFECT OF CLIMATE ON WOOL.—T. FANNING, President of Franklin College, Tenn., in replying, through the *Southern Homestead*, to Mr. COCKRILL's "challenge" in regard to Saxon sheep, says:—"The effect of a warm climate, is to thin out and shorten the fibre, and lighten the fleece, take the wool from the limbs and under portions of the body, and substitute rough and hairy locks, particularly about the hips, neck, etc. In higher latitudes, sheep are more compact and uniform in the fleece over the whole body, and the yield is perhaps double that of Southern flocks. As we approach the North Pole, in order to prevent the escape of animal heat, the Almighty makes the fibre finer and astonishingly softens and thickens it over the body. This is exemplified in all the animal creation. Even the wolf, that is here a bristly beast, in the North is clothed with fine, soft fur; and there is not a fur-producing animal whose fibre is not finer and softer to the touch in the North than in the South."

STEAM CULTIVATION.—Under the head of "KEDDY'S Patent Traction Engine, Steam Plow and Land Cultivation Company," an advertisement appears in the Chicago papers, which says:—"This Company has for its object the development of the above system of Steam Cultivation in the State of Illinois, and will, in May next, be prepared to contract for the cultivation of farms, break prairie, and supply machines to purchasers." This looks like being ready for work, though many have no faith in plowing by steam, while some pronounce the idea a stupendous humbug. Let up wait and see what time and genius will accomplish.

Agricultural Miscellany.

THE WEATHER has been quite boisterous—with snow, rain and high winds—for some days past, and of course unfavorable for out door operations. March not only "went out like a lion," but as we write (April 5th) the alternate snow and sleet, and chill blasts, convince us that the animal is still roving, and that "the Winter of our discontent" is not yet "made glorious Summer," nor Spring, and that we must wait patiently, we trust not long, for bright sunshine and a balmy atmosphere.

SLICK UP.—Yes, that's the phrase—*slick up* the whole premises. Now's the time to clean up about the house, barn, garden and farm generally. Slick up the dog yard, and all the other yards, fields, fences, buildings, and so forth. After "sleeking up" things once, you will not only feel a vast deal better, and have an easier conscience, but will find it comparatively trifling task to keep things "to rights." A little time and labor now will accomplish much, and if you, Mr. Husband and Father, think anything of your family, and wish to make home pleasant and attractive to wife, children and friends, you will act sensibly and wisely and SLICK UP THE HOMESTEAD.

THE COMING WHEAT CROP.—Col. JOHNSON, Secretary of the N. Y. State Ag. Society, has made the following estimate of the comparative yield of the Wheat Crop of 1883 and 1889, in the United States—predicated, we presume, upon the probable number of acres sown:

Estimated product for	1888.	1889.
New York	32,000,000	30,000,000
Pennsylvania	20,000,000	30,000,000
Virginia	20,000,000	18,000,000
Kentucky	10,000,000	8,500,000
Ohio	27,000,000	22,000,000
Indiana	15,000,000	18,000,000
Illinois	15,000,000	14,500,000
Other States	50,000,000	42,000,000
Total	180,000,000	158,500,000

COL. SAMUEL JACQUES, for many years a distinguished agriculturist and horticulturist, died at his residence, Ten Hills Farm, Somerville, Mass., on the 27th ult., in the 88d year of his age. Col. J. was widely and favorably known as a stock-breeder. As early as 1830 he took a prominent lead in cattle, and in breeding Short-horns. He also paid considerable attention to the improvement of horses—having kept the celebrated imported horse Bellfounder (Norfolk Trotter) from 1822 to 1838, and subsequently, for two seasons, the famous Sherman Morgan, the sire of Vermont Black Hawk. Col. J. was also for several years a prominent and successful breeder of Merino and other breeds of sheep.

GOING TO EUROPE AGAIN.—We learn that SANFORD HOWARD, Esq., of the Boston Cultivator, purposes to leave for Europe on the 4th of May, in the Arabia. Mr. HOWARD visited Europe last season, and we presume similar business—that of selecting and purchasing improved stock, for which he is eminently qualified—induces the trip contemplated. May he have a pleasant and prosperous journey, and safe return.

NEW POTATO DIGGER.—We have been shown a working model of a potato digger recently patented by Mr. ROBERT NIVEN, of this county, which appears to supply a long-sought desideratum. The machine was thoroughly tested last season, before application was made for a patent, and is said to fulfil its design admirably. The model certainly works well, and we predict that "Niven's Potato Digger" will prove a success.

AN EXTENSIVE FARMER.—It is said that JACOB STRAWN, of Rockford, Ill., went to that State twenty-five years ago, a poor man, and has by industry and perseverance become one of the most wealthy and prominent farmers in the Union. He has reduced to cultivation over 20,000 acres of land, and has now one farm of 7,500 acres, and another of 10,000. He usually employs from 200 to 300 men, and till recently has stabled from 5,000 to 6,000 head of cattle every year.

LOCATION OF APIARY.—E. W. PFELFS says:—"I always prefer an eastern aspect, or one bearing a little south of east, as this gives the bees the influence of the sun in the morning, or fore part of the day, when it is beneficial to them, and during the middle of the day it will not be as oppressive as when the hives are fronting the south. Whatever the aspect may be, the hives should never be exposed to the rays of the sun during the middle of the day, excepting in April and May."

THE ADDRESS delivered before the N. Y. State Ag. Society, at the Annual Meeting, Feb. 10th, 1890, by Wm. T. MCCOON, the retiring President, and that of ABRAHAM B. CONGER, on taking the Chair as President elect, have been published in a handsome pamphlet by the Society, and are sensible and appropriate. We are indebted to Mr. Secretary JOHNSON for a copy.

A BILL TO PREVENT CRUELTY TO ANIMALS has passed the Mass. Legislature, and been approved by the Governor. It provides that "Every person who shall cruelly beat, maim, or torture any animal, shall be punished by imprisonment in the county jail or house of correction for not more than one year, or by a fine not exceeding one hundred dollars."

COL. JONA. READ, of Brooklyn, N. Y., died last week, aged 87 years. The N. Y. Tribune says he was the inventor of the first reaping machine built, and of many other machines now in use; also that he was the first to introduce the Lima bean into this country, importing it himself from Lima in 1800.

A SELF-RAKING REAPER has recently been invented and patented by C. R. BRINKERHOFF, of Batavia, N. Y. From an examination of a working model, we are inclined to think the machine comprises some very valuable features—the raking attachment operating very perfectly.

A WISE LAW.—Michigan has passed an act donating 40 acres of land to every actual settler who shall reside upon the same for five years continuously. Michigan is a good State to settle in, aside from each enactment, and many emigrants "go farther and fare worse."

RABBIT, THE AMERICAN HORSE TAMER, still flourishes. He lately gave four demonstrations of his skill in Brussels, handling nine horses, one of them a very wicked picaud mare, and the gray savage par excellence of the army, who had been regularly thrown for eight years to be shot. It was full twenty minutes before the fore leg could be got up; but when all was over, his groom took them up outside just as he liked. There were 250 subscribers, and of these 84 were officers sent in by the Government. Five of the Royal family were among the subscribers, all of whom were of course delighted with the "performance." He was next going to Berlin. By-the-way, what has become of RABBIT's pupils and imitators in this country? Have all our wild horses been tamed—or is it true, as some assert, that we have few vicious animals here, compared with those in the old world, and if so, why?

THE STRUCKEN CO. (N. Y.) FAIR is to be held on the 25th, 26th and 27th days of September next.

THE VEGETABLE GARDEN.

No one who has not had a good vegetable garden knows how essential it is to good living. Money can scarcely buy the luxuries it affords. To be able to obtain when wanted, and fresh from the garden, radishes, lettuce, peas, &c., well grown and tender, is a privilege that few who have enjoyed would be willingly deprived of.

For a successful vegetable garden the soil must be well drained, thoroughly and deeply pulverized by plowing or digging, and made rich with manure. The ground must be kept mellow as the crops are growing, by hoeing, and all weeds promptly destroyed.

EARLY PEAS are among the first things to be sown, and this should be done as soon as the frost is out of the ground. Some writers recommend raising pea plants in boxes in hot-beds, and transplanting them, but we never found this to pay for the trouble. The best way is to select the warmest, driest soil and the most sheltered position in the garden, and sow in drills, (running east and west if possible,) two inches deep. Two rows, twenty feet long will take about one pint of seed, and will be enough of one variety for the first sowing. As soon as sown, place a wide board on edge, on the north side of each row, inclined over the rows at a slight angle, and supported at each end with sticks. This will afford a good shelter, and the ground will become quite warm, having the full benefit of the sun, while sheltered from the wind. These boards may be taken away when the plants are two or three inches high, and the earth drawn to the plants. This drawing of the earth to the plants should be repeated several times, as it is a great protection, preventing injury from the wind. When eight or ten inches high they should be staked, and of course the length of the stakes or brush, depends upon the variety sown, some sorts growing only two or three feet high, and others five or six feet. The stakes should be placed on both sides of the rows, slanting inwards so that the tops will meet, and so firmly set in the ground that they will not blow over.

Another plan which will give peas at least a week earlier, is to make a frame with a board for the back, and lights of glass in front—the front of course facing the south. The engraving will show very plainly how it is made.

The two best varieties of Early Peas we know of are the *Prince Albert* and *Early Kent*. The former is of a little better quality, but not so early, as we have proved, by growing them together half a dozen times. Others, we know write differently. Of the latter sorts we would recommend the *Blue Marrow*, a fine, large pea of good flavor; the *Sugar Pea*, a very sweet, fine pea, growing five or six feet high; the *British Queen*, a large and luscious pea, growing also five or six feet high; *Knight's Wrinkled Marrow*, an excellent, fine flavored pea. The two last varieties named, when ripe, are wrinkled, like sweet corn, and is as much better than the common pea, as the sweet is better than our common yellow corn. There are several other varieties of a similar character; and indeed excellent table peas may be obtained at almost any store where garden seeds are sold.

If a pint or quart of each of these varieties are sown at the same time, they will be fit to pick in succession, from the latter part of June to the last of July, or later. A few may be sown every two weeks, which will prolong the season, as desired.

EARLY POTATOES should be planted at the same time, as peas. The *Early June* can be obtained in almost every neighborhood, and the *Mountain June*, and with proper attention every one can have *Green Peas* and *New Potatoes* on his table by the 25th of June, at least, in ordinary seasons. A good early potato is grown here, by our best market gardeners called the *Early Manly*. It is smaller than *Early June*, two or more weeks earlier, round, cooks dry, and is of good quality. If planted early in April it entirely ripens off by the middle of July. The yield is small, but its earliness makes it a very valuable variety.

Having provided for peas and potatoes, it will be necessary for those who have not provided for such things in a hot-bed, to make arrangements for cabbage, tomato and other plants. Select a warm, sunny border, on the south side of a fence, if possible, and after having the ground well prepared, sow cabbage, cauliflower and radish seed. After the seed is sown give the bed a good sprinkling of coal ashes, if you have them and roll it, or beat it gently with the back of the spade. Then, it would be well to make a light frame around the bed a few inches high, and cover the top with a piece of gauze, which should be nailed to the frame. This will prevent injury to the young plants from insects, and save you a good deal of loss and vexation. Tomatoes, celery, peppers and lettuce, should be planted at the same time, and any other plants that may be desired for transplanting, and in the same way, but will not need the protection of the gauze, as they are not so liable to the attacks of insects. *Dish water*, or greasy water of any kind thrown over plants once or twice a week, is said to be a sure protection against the black fly so destructive to turnip, cabbage and other plants in their first stage.

The best early cabbage is the *Winningdale*, a very early sugar-leaf shaped variety, tender and solid. Where this should be obtained, the *Early York* should be sown. The best cauliflower for this country is the *Early Paris*. It will head as readily as a cabbage, and is excellent in every way. The best radish is the *Early Oval French*, which is exceeding tender and fine flavored. When this cannot be obtained, sow the *Scarlet Short Top*.

CULTURE OF THE GRAPE.—No. V.

Which is the best way to prune to insure uniform good crops of fruit, the renewal system, or by branches on old wood? I have given this subject much reflection and am decidedly of the opinion that to grow uniform full crops of fruit every year, the old wood with branches is the best way.—When vine-dressers understand that the sap and nutriment that the roots gather can just as well be exhausted to grow fruit instead of wood, the tendency will be to overload the vine with fruit and there will be a deficiency of good, young wood, to fill the trellis for the next year's crop. The result will be, on the renewal system, a full crop of fruit every other year, but on the old wood system there is no difficulty in getting a sufficient amount of branches with four good buds each, to fill the trellis every year with bearing wood.

It is well known that fruit trees mostly grow wood and fruit buds one year and load with fruit the next year, but not so with the grape vine.—They load with fruit buds every year. Above every leaf is two buds, one the lateral bud that generally begins to push forward before the leaf is half-grown, the other is the next years fruit bud that should not be started forward by too close summer pruning. But grape vines have their bearing seasons, and it is known in this way—in an unfruitful season the fruit buds only produce from one to three, and occasionally the fourth cluster; in a bearing season they produce from two to four and occasionally the fifth cluster. Now, there is no difficulty in loading grape vines with a full crop of fruit every year when their true habits are understood. In pruning vines on an upright trellis, labor to get the bearing wood in as even a sheet as possible, on the trellis, saving those branches only on the south side of the vine. If the bunches average about two feet apart, let but two buds grow on a branch and but two clusters to each bud, which makes four clusters to each branch, and if the branches are two feet apart, averaging a cluster every six inches on the old wood, labor to give to each an average amount of the fruit, as each branch receives about an equal share of the sap that passes through the pores into it. Keep in mind that about the time when the blossoms begin to appear old wood can be pruned off. In placing the vines on the trellis in the spring, if the old wood is found too thick, leave it on the ground to be pruned off the first summer pruning.

There is another advantage in raising fruit on branches on old wood—there will be less fruit shaken off by heavy winds. Still another advantage is, the vines will be more equally balanced by wood above ground and roots below ground, giving more storage for the sap the roots gather.

I would ask the question, *Does severing large wood of vines render the pores that passed into it useless in the remaining old wood?* I incline to the opinion that it does, from these facts. Cut a sugar maple that has been tapped with an auger, and there is found a dead streak about the size of the wound the auger made, ten or fifteen feet up the tree. Sever a large branch from a fruit tree, and fifteen or twenty years after that tree is hollow or decayed by the wound, showing the circulating life is destroyed in so much of its wood, by the wound. Now, if this is the case, severing large wood on vines should be avoided as much as possible. I have heard it frequently recommended, especially by Germans, that plucking off the leaves when the fruit was about grown, helped to forward its ripening. I have picked the leaves from parts of a trellis and let them remain on the rest, and could perceive no advantage by it, but in some cases an injury. The fruit being suddenly exposed to the sun's rays, it was scorched on the sunny side. I have seen repeated instances showing conclusively that by summer pruning, so as to give the fruit a crowded supply of sap from the time it first forms, until it is fully ripe, it is a fortnight earlier in ripening, much larger in size and more delicious in flavor.

When are grapes fit to gather? Not until the fragrance passes freely from them are they ripe. I have had people tell me they could smell the fragrance of the grapes when passing in the highway, though the vines are 12 to 20 rods distant. Grapes put up for long keeping should not be kept before packing until the stems are dried. Pack immediately and put enough dry substance with them, and the moisture in the stems will pass into the fruit, and help keep it fresh.

ALVIN WILCOX.
West Bloomfield, Ontario Co., N. Y., 1859.

SOFT SOAP FOR FRUIT TREES.

Messrs. Editors:—I have received of late so many letters inquiring what will prevent the *Curculio* and other insects from destroying fruit trees, with one request from an intelligent farmer that I should give my remedy through the columns of the *RURAL*, that with your permission I most cheerfully attempt the task, though the same has often been verbally expressed, and has been printed in one of my *Agricultural Addresses*. In the first place, let me say that a portion of my trees never fail to bear fruit. To make this sure, I draw coarse manure in February or March, whilst the ground is frozen hard, and throw a pile around the tree, so as to prevent the frost from coming out of the ground until such time as I have reason to believe they will be so late in their flowering that they will not be blasted by frost; or, by what is more common, the late cold blowing rain storms. I then spread the manure over the orchard, leaving sufficient covering around the tree to bring the fruit forward in season to ripen, which will be quite as fair as though it had started two weeks earlier. This I do every year to a portion of my trees, and am sure to secure sufficient apples for my own use. I have not been without apples thirty days at any time in the last twenty years. I admit that this course is only necessary occasionally. Perhaps not more than once in five or six years, by the neglect of this, will you be compelled to do without fruit. I am quite as confident that my trees need manure as does my corn, (though not too much). I apply it to one portion this, and another next year, and so on, until I come around once in three or four years.

To prevent insects, I use everything that they dislike most. Soft soap, made thick, and from any dirty grease, (mixing with beehives' gall improves

it,) applied in the spring in all the crotches of the trees, is a sovereign remedy for the Borer, Curculio, Caterpillars, and everything else that disturbs my trees. Soap and beehives' gall are indispensable to the farmer. The former he can make, and the latter he can obtain in New York, if nowhere else, by sending a jug to a butcher's boy, for a dollar per gallon, which will also be useful to prevent rats and mice from eating harness, trees, and many other things. In the fall, to secure the tree from injury in case the soap, washing down the tree with every rain, should stop some of the pores, wash them with good strong lye, if old trees; if young, the lye must be weak, as strong lye would kill them. The same application will prevent the Curculios from destroying plums to a very great extent, if not fully. They let my plums alone, as they find others in the neighborhood they like better. What may appear stranger still is, that the application, with proper treatment, will not only prevent the black knots from growing on cherry and plum trees, but I now say that I can grow them off the worst tree that can be found, with skillful trimming. I say this with full confidence, for the reason that some six or seven years ago, I said to some of my neighbors, that I believed that I could grow them off, in answer to their saying that they had and were destroying their trees. I replied that I would make the trial on the worst trees they could find. I was cited to those that were completely covered with the knots—the Morrell cherry, which is the most affected in this vicinity. I took a draining plow, with four yoke of oxen, and made three drains, twenty inches deep, lengthwise of the row, three feet apart, on a very wet, cold, hard-pan soil, on the road side, that every passer by could see what I could accomplish, or at least what I believed I could, and there set the trees; and now more than one-half of those scrubby, sickly, knotty trees, are as clean as a horse's tooth, and bearing cherries. The balance, I believe, in two years more I shall have in equally good condition. There has never been any manure applied to them except ashes burnt from the sods to keep the grass from growing up to choke them. On the other hand, the nursery from which I took the worst, are nearly or all dead, and have never borne a cherry or plum since. I make no pretensions as a fruit grower, as the soil I cultivate is not as well adapted to the growing of many kinds of fruit as it is to most farm crops, and only know from observation the likings and dislikings of my trees. I have learned what my soil lacks, and understand the peculiar taste of the insects and vermin that affect them, and can thus protect the trees with that they dislike most.

Soils can be too rich as well as too poor for all kinds of trees, and therefore no man can tell what is good for this or that soil until he sees it, for, whilst most land is made better by manuring, I know soils that should be impoverished by cropping, to prevent the trees from growing so fast as to winter kill. This treatment, if commenced with trees when young, will render the bark as smooth as glass. The soap should be applied in less quantities, and the lye much weaker, than after standing several years. If the trees are old, and the surfaces rough, you must apply the soap unsparingly, and the lye as strong as it can be made. The next Spring, just after a rain, whilst the trees are still wet, take a hoe and scrape off the coarse, shaggy bark, and the trees will look as though they were of a different kind.

A. B. DICKINSON.
Hornby, N. Y., March 20th, 1859.

STONE UNDER FRUIT TREES.

Mr. Moore:—I beg to differ with you on the subject of using stone in setting out trees, especially in light sandy or alluvial soils. It has ever been a common saying and the received opinion as correct in principle among farmers, that stony land was the best and most successful soil for orchards. I have myself succeeded by that process in making large trees, when transplanted, to grow and thrive, particularly cherry and forest trees, when all other methods failed. I throw into the hole prepared for setting, common loose stones and pebbles enough to simply cover the bottom, and a slight sprinkling of earth over them and set the trees in the usual manner.

I remember some dozen years ago, when walking up the Mississippi river, about a mile above the city of Dubuque, in Iowa, of observing a most beautiful array of shade trees, of the basswood or Linden, about a private residence. I observed to my friend that the owner was smart to succeed so well without a single failure. "Well, there he stands, let us find out his process," he informed us that the only secret was that he paved the bottom of the holes with stones, and that he brought them from two miles distance—that after a good many trials it was the only way he could succeed.

The basswood, one of the finest shade trees, is one of the most difficult to remove and transplant with success, so is the whitewood, chestnut and oak, but by this process, by careful taking up and setting, it will, nine times in ten, succeed. I can give no rational theory on the process, unless the supposition that the stones condense the moisture arising from the earth, and, perhaps, a slight decomposition of the stones themselves, which contain the elements of nutrition to the plant.

MONROE CO., N. Y., 1859.

REMARKS.—All we have to say to this process is, try it. We never lose many trees in setting, without the stones—not two per cent. if the trees are in good condition and well taken up.

THE GARDENER'S MONTHLY.—This is an excellent Horticultural Journal, published in Philadelphia, and edited by THOMAS MEHMAN. It consists of sixteen quarto pages fairly printed and illustrated, and is issued monthly, at \$1 per year. The volume commenced in January, and the contents of the work is of such a character that we can cheerfully commend it to our horticultural readers.

SPRING WORK.—But little time remains for performing the rough work of spring, such as draining, trenching, making walks, planting, &c. Much of the success of the whole season depends upon commencing early and right. Make the soil deep and rich, secure the best plants and seeds, plant carefully, and then cultivate well and success is certain. Do everything in the best manner.

THE KING APPLE.

Messrs. Eds.:—Noticing some remarks in your valuable paper of February 26th, in relation to the truly famous *King Apple*, it is stated that its origin is unknown, to which latter statement we, in Winnebago Co., beg leave to differ. Its origin, as we have it, is simply this. In about the year 1800 a Mr. JAMES LUTTS moved into the town of Ulysses, Tompkins Co., N. Y., from New Jersey, bringing with him a few scions from a favorite seedling apple tree in New Jersey, and having at that time no orchard of his own, the scions were grafted by him into two trees in the orchard of Mr. JACOB WYCOFF, which is situated at Jacksonville, town of Ulysses, Tompkins Co., N. Y. Upon a subsequent visit of Mr. LUTTS to New Jersey, he went to his old favorite seedling to get a few more scions, but imagine his grief at finding the days of his favorite tree numbered; "but of what disease it died deponent saith not." Upon returning home he at once went to the orchard of Mr. WYCOFF and begged the privilege of cutting a few scions from those two trees. When, lo and behold, one of them was found dead, and from the one living tree in the orchard of JACOB WYCOFF, sprang the entire family of *Tompkins County Kings*.

The above statement of facts I gathered from L. W. OWEN, Esq., of the town of Owen, in our county, and who had been for many years previous to residing here, a resident of Tompkins county, and was himself personally acquainted with Mr. JAS. LUTTS, aforesaid, and had heard him in person give a narration of all the circumstances of the narrow chance of this valuable apple becoming extinct.

Rockford, Ill., March, 1859. J. S. SHERMAN.

GROWING GRAPES.

Every man who has a house has also a south side to it, and there dig deep, say four feet at least, and as wide and long as you have room. Pulverize and enrich the soil well, and there plant and grow at least one grape vine. Every man who keeps house and has a family—as all men should have—will have to find some means to dispose of soap-suds, and other refuse water, the year round. Now, nothing is more congenial to vine and fruit than daily contributions of such materials at the roots of the vine. In addition to putting it about the surface, you can make an underground drain from your rear door, and end it about two feet underground, contiguous to the roots of the vine; and then, to make room for all that may come, dig down two feet further, the size of a hog's head, and fill, up to the top of the drain, with small cobble-stone, cover them with sods, and fill up the rest with earth. In so doing you have provided for that which otherwise might become a nuisance, and made it conduce very much to the growth of one of the greatest luxuries in the way of fruit, and give you and your friends happiness otherwise unattainable. Growing good grapes will not only give you a splendid opportunity to increase the number of your friends, but a good chance to overcome your enemies.

S. N. HOLMES.
Syracuse, N. Y., 1859.

APPLES FOR THE NORTHWEST.

Eds. *RURAL*:—Thinking, perhaps, a list of apples (as they are the only fruit we can grow successfully in this State,) best adapted to the Northwest, might be of benefit to some of your readers, I send the following which I know are perfectly hardy:

Best twelve varieties for an orchard of one hundred trees.
Early Strawberry 15; Early Harvest 10; St. Lawrence 15; Fameuse 10; King of Tompkins Co. 85; Golden Russett 15.
Best twelve sorts for an orchard of one thousand trees.
Early Strawberry 100; Early Harvest 50; Summer Queen 50; St. Lawrence 100; Fameuse 50; Dyer (Pomme Royal) 50; Bailey Sweet 50; King of Tompkins Co. 800; Golden Russett 100; Pound Royal 50; Newtown Spitzenberg 50; Male Carle 50.

For a list of twenty varieties, add to the foregoing Pound Sweet, Fall Orange, Newark Pippin, Northern Spy, Ribston Pippin, Westfield Seek-nor-further, Williamson, and Swaar.

I have tested upwards of twenty varieties each of pear and cherry, and could not find one sort that would endure the severity of the past winters—even seedling apple trees have suffered.

Lodi, Wis., 1859. L. H. DOYLE.

RENOVATING HEAT IN OLD HOT-BEDS.—Several writers in the *Gardener's Monthly* are recommending methods for renewing heat in old hot-beds. Dr. UNLER was successful by pouring into them a hot solution of glue, distillery still, or any nitrogenous and rapidly decomposing substance, which acts as a sort of yeast, or fermenting agent, to excite decomposition and consequently heat in the substance of the beds. Dr. Houghton accomplished the same thing by using a hot solution of potash in a partially caustic state. Potash, common lye from wood ashes, and carbonate of soda, if freshly slacked lime is added to the solution, will cause a new, powerful, and lasting heat in the hot-bed, and its power is very much increased if a solution of glue, Peruvian guano, blood or other offal is added to the bed. After the solution is put on the bed, pour on plenty of hot water. Of course the earth must be renewed when this is done. This is a valuable discovery, as it enables us to renew heat with very little trouble, and by a suitable construction of the bed the liquid might be added at any time when the heat declined.

APPLE TREES FOR FENCE POSTS.—I set out about fifty rods of apple trees three feet apart, a few years ago, and when three inches in diameter, nailed boards to them, with the middle tree on the opposite side—boards 18½ feet long. I now wish I had set out all my orchard in this way. Some say the wind will rack and break the nails. Mine have not. I think it economy, even in our wooden country, and on the western prairies I think it would be a great saving. Let the trees get large in the nursery before setting out, and you will not have much trouble by the cattle spoiling them.—L. MOORE, Hartford, Ontario Co., N. Y.

KEW GARDEN.—In 1841, the number of persons who visited the Kew Gardens was 9,174; in 1857, 301,978. The behavior of visitors is also improved.

ICE CREAM, FROSTED FRUIT, &c.

Messrs. Eds.:—E. Y. E. inquires for a good recipe to make Ice Cream. I send one with a few others that I know to be good:

ICE CREAM.—Half a pound of loaf sugar to each quart of rich cream. Flavor with vanilla or the peel of one lemon soaked in the juice of the lemon. Grate then peel, then strain all through a piece of muslin into the cream.

FROSTED FRUIT.—Beat the whites of eggs and dip the fruit in them. Then lay it in finely powdered sugar, put on a tin with white paper under, and set them in an oven nearly cool to dry. When the icing is firm pile them on a dish and set in a cool place. A very pretty dish for evening parties.

COLOGNE WATER.—1 pint of brandy; 30 drops oil of lemon; 30 of bergamot, and half a gill of water.

ROSE BRANDY.—A laying of rose leaves and a laying of sugar; when the sugar is dissolved bottle and add a little brandy.

APPLE CUSTARD PIE.—Grate 4 sweet apples, add a pint and a half of milk, 3 eggs, sugar, a little salt, season with lemon or nutmeg. Bake as a custard.

SPRING BEER.—Take a small bunch of all or a part of the following:—Sweet fern, sarsaparilla, winter green, bassafra, prince pine, and spice wood. Boil with 8 oz. of hops to 4 gallons of water and 3 raw potatoes pared and cut in thin slices.—The strength of the roots will be more thoroughly obtained by boiling in two waters, for the hops have a tendency to bind more than to extract the juice; the roots should be boiled five or six hours. Then strain, add a quart of molasses to 8 gallons of syrup, brown half a pound of bread and put into it; if too thick, dilute with cold water. When lukewarm, add a pint of fresh lively yeast that contains no salt. Keep in a temperate situation, cover, but not so tight as to entirely exclude the air. When fermented, keep in a tight keg, or bottle and cork.

USEFUL RECIPES.

Messrs. Eds.:—Disease and death most frequently result from colds neglected. I keep and use a remedy, which, if you think of value, you can publish, with a few others for Rheumatism, &c., among your list of useful recipes:

COUGH MIXTURE.—One ounce liquorice; 1 oz. gum Arabic; 2 ozs. rock candy pulverized and dissolved in a cup of water, kept warm or hot, and frequently stirred. When dissolved and cool, add 1 oz. paregoric and ¼ oz. antimonial wine. Then bottle and take a teaspoonful as frequently as the judgment may direct, to allay that tickling sensation, accompanying the coughing spells, which is experienced by those who have a cough and hoarseness. As I commend only by experience of favorable results, I will add two more.

RHEUMATISM.—Equal parts of spirits of turpentine, ammonia, oil of peppermint, and olive oil.—Apply a teaspoonful well rubbed and heated in, three times a day.

CUTS, SORES AND INJURIES.—Two quarts alcohol; 1 oz. blue vitriol, and 2 ozs. copperas pulverized, and added to a part of the alcohol. Then 1 oz. of gun powder to the remaining alcohol, and after remaining awhile, mingle together. Use as a wash. Jackson, Mich., March, 1859. EUREKA.

RHUBARB, OR PIE-PLANT PIS.—As the season is approaching when the luxury of a nice rhubarb or pie-plant pie may be enjoyed by those who know how to make it, I will send you my recipe, which is the best I have ever known. If any of the many contributors to the "Domestic" corner of your excellent paper have a better one, will they send it and oblige?

Peel, slice and stew, in a very little water, the fresh gathered stalks. Then take 1 teacupful of the stewed rhubarb; 1 cup of sugar; 1 egg; 1 tablespoonful of flour; (or, if very juicy,) a little lemon peel, chopped or grated. This is sufficient for one pie. Bake between two crusts. The above is at your service.—Mrs. H. E. T. W. STILSON, Nunda, N. Y., 1859.

A "SALLY SUNN," OR HOT TEA CAKE.—For 12 oz. or a pound of flour, warm 1 oz. of butter in ¼ pint sweet milk; a teaspoonful of salt; 3 small eggs, and 1 tablespoonful of yeast. Mix the flour well into the other ingredients and pour the whole into a tin pan buttered, &c. Set it to rise. Bake till a nice light brown—about 30 minutes. If brewers yeast be used, it will rise in a little more than an hour. Hop-rising will take 6 or 8 hours to rise.—E. E. H., St. Thomas, Elgin Co., C. W.

COLORING RECIPES.—Information Wanted.—Will some one of your many readers, be so kind as to inform me, in the columns of your inestimable paper, how to color silks, merinos, and paramettas, mazarine blue? Perhaps many others would be glad of the information.—AMOREY SEARCH, Jancerville, Wis., March, 1859.

TO PRESERVE ORANGES.—Will any of your numerous correspondents inform me through the columns of the *RURAL* of a good receipt for preserving oranges, of which there is a great abundance in these regions, but are too sour to be eaten as fruit.—M. A. WHITE, Houstonville, East Florida, 1859.

HOW TO COOK BEANS FOR A BACHELOR.—Will some of your readers tell an old bachelor the different modes of cooking beans, and the best mode for a dyspeptic person, through your domestic column?—M. C. A., Barbours Co., Va., 1859.

REMARKS.—It strikes us that beans are a rather poor diet for a dyspeptic bachelor. Nevertheless, having no experience with either complaint, we submit the question.

ALICE.

When I hear her silvery voice
Float out upon the listening air,
Some power doth whisper, "Heart, rejoice!
Look up! around thee still the world is fair."
And when within her eyes there gleams
A gem whose homo was once her heart,
My soul floats on a tide of dreams—
Bright golden dreams to Hope's dear mart.

And thus my Alice is to me
The shrine wherein I lay my heart's parovow,
The compass that directs me o'er life's sea,
The goal my once lone spirit rests in now,
An angel that doth watchful hover near
When sin's alluring form comes tempting nigh,
A seraph who hath left her blissful sphere
To lead me up beyond the distant sky.

Grand Rapids, Mich., 1889. MRS. J. W. S.

CHANGES.

WHAT important changes take place within the space of a few years. Let one leave home for a short time, and the marked change that meets him on his return is truly surprising. Children have grown to men and women—new dwellings occupy the places of the old ones—familiar faces, that in remembrance glowed with health and beauty, are now over-spread with the pallor of disease, or furrowed deep with the marks of care and toil. Families are broken up, business or pleasure has scattered them up and down the earth, while many, have gone to their final homes—the dark, narrow house of the dead. But these are not all. Customs, habits, and pursuits have changed also. The wooden latch, with the string always on the outside, has given place to the knob and knocker, with which one can never arouse the inmates before eight o'clock in the morning. The clean, white floor which was once found in nearly every dwelling, is now covered by a carpet which brings a scowl of disapprobation every time a foot darts tread on it. The old fire-place, with the huge oven attached, from which we have seen so many pies dragged forth, smoking hot, is now torn down, or else covered forever. The merry laugh and quick, elastic tread of those who once wore heavy, solid calf-skin shoes has given place to hacking coughs and wafer-bottomed gaiters. The hum of the spinning-wheel, accompanied by the clear, musical voice that was once heard at nearly every window as one passed through the country, during the summer months, or early part of autumn, is now hushed, and in its place is heard the everlasting thrum of the piano, with vain attempts at mimicking chickadees and cat-birds.

We lay no claim to a morbid propensity of worshipping antiquities, but we do fail to see the benefits of exchanging health and happiness for what are termed fashionable accomplishments and modern improvements. We, of the present generation, are too apt to look upon the past with a smile of derision and stigmatize it as the age of barbarism, we think that mankind were but a little above the brutes till within a few years, forgetting, perhaps, that as far back as six thousand years ago our species were created but one degree below the angels, and that there has been virtuous hardihood, disinterested patriotism, heroic contempt of danger and of death, open-handed hospitality, guileless innocence, and affections stronger than the grave in the mighty lapse of ages, that may seem to us as chaos, so far as brilliant accomplishments are concerned. "Modern Improvement" ought not to laugh when he sees an aged man passing along the street in his old-fashioned buggy, with high back and low wheels, eating crackers and cheese, for it was by pursuing the same course, and at no very remote period either, that our ancestors were enabled to transmit to us whatever advantages we may enjoy.

BENEVOLENCE IN DRESS.

"SCHIMMERS" has presented a pretty good argument in favor of fashionable skirts—at least, it seems so at first thought. Certainly it must add to the sum of human happiness to enable the ungraceful and deformed to believe that their defects are concealed from observation; so, perhaps, it is, after all, the part of kindness to just let this matter of dress reform alone, and continue loyal to Fashion.

But, then, how came so many women ungraceful and ill-shaped? I wonder if these long dresses had not something to do with it. We are told by reliable physicians that a very large proportion of American women have distorted spines as the result of their style of dress and habit of living too much within doors. Why do they not go out more frequently to take exercise in the open air and pure sunlight? Because, if fashionably attired, they cannot, with any degree of comfort, except on pleasant days; and then, with more than double the fatigue that they would experience were they clothed sensibly. Many a poor, misshapen child might have rejoiced in firmer proportions had its mother dressed in accordance with physiological laws. In every town we see scores of sickly women, having scarcely enough strength to drag about their long and cumbersome skirts, who realize that the "reform dress" is just what they need, but feel that they have not sufficient physical strength to "face a growing world," and they earnestly wish that those women who have health, and strength, and influence, would assist the public to the appearance of the reform dress. Would it not be kind to do this? For a woman to countenance long skirts and hoops from motives of benevolence, seems to me about as inconsistent as for a rum-seller, out of the kindness of his heart, to build an inelegant asylum while he continues the process of making drunkards.

With Mrs. "Schimmers," I have no expectation

that Fashion will favor short skirts very soon. Meanwhile, the number of women having thick ankles, distorted spines, crooked limbs, and an awkward, clumsy gait, will go on increasing. But will this reform stand still? No, because their are true-hearted women engaged in it, and these are encouraged by the best and most intelligent men, not a few of them are among the readers of the RURAL.

Public opinion is slowly changing, and women, who care more for the right than for the world's favor, are continually breaking away from the ranks of Fashion, and are beginning to dress in accordance with their own ideas of propriety. The time will come when all sensible women will be ashamed to dress in their present style—a style so inconvenient, so destructive to health, and so contrary to true taste. The vain and frivolous will only follow because compelled to do so.

SISTER FANNIE.

TOO FINE FOR USE.

THE New York Times has some sensible comments upon the lack of comfort in many of the dwellings of modern times. The writer truly says that too many houses in American cities are so fine that the people who own them are afraid to use them. The following parlor sketch is well drawn: Call in at any brown stone front, "above Block-er," at any time except on the occasion of a great "spread," and it has the air of a very nice old maid in morning gown and curled papers—a cross between iron precision and painful desolation.—Everything exists in a state of bagginess. The sofa is a mute inglorious corpse in a dimly winding-sheet. The chairs are put away in aprons and pantalettes. The chandelier wraps its night-gown around it. The shutters are closed to keep from fading the carpets, and only here and there, thro' the cracks, a little bit of scared light peeps in and looks around, in a tremulous and sickly way.—Everything smells of brown Holland, and everything looks as if it considered you fearfully impertinent for daring to come in and disturb its elegant uselessness and brown linen repose. It is very much like going into a family vault after an epidemic, and having a lively time with a party of corpses in fresh grave clothes. In fact, you feel decidedly like asking the mistress of the house why she doesn't complete the picture by putting up the clothes' lines in the parlors, and hanging up the week's wash.

Soberly, this show-shop arrangement, which makes home a nuisance, and drives father and son out of doors for that comfort which their own house is far too fine to afford them, is a growing nuisance, and lies at the bottom of half the social evils. When a man comes home after the fatigues of business he doesn't want a show-wife nor a show-shop house. He doesn't want an invisible palace; but a visible home. He wants something made to wear and use, and allowed to be used after its kind. He wants chairs that he can lean back in; and carpets made to be walked on; and a house alive all over; and a wife and children whose daily thought is how it can all be made happiest, cheeriest, most thoroughly comfortable for him.

MANAGEMENT OF CHILDREN.

ALL parents, and others, having the control and management of children, should remember that it is difficult to make a child really understand precisely what is meant by truth and honesty. It is not every departure from veracity in a child just learning to speak, or every misappropriation of property into which it may slide, that should be branded with the opprobrious name of falsehood or theft. The culprit may be clear of any bad intention, and ignorant of any fault, although the fact may be clearly proved. Caution, discrimination and much kindness are, therefore, requisite in correcting these evident faults, while advantage should be taken to inform the understanding and quicken the conscience, as to the broad difference between right and wrong. With those children who are the most sensible of this difference, and on whom the guilt of falsehood has been most firmly impressed, a frequent incentive to its commission is fear. An active and unlucky urchin meets with some trifling accident, or perhaps perpetrates some wanton mischief. Immediately his little heart beats quickly with dread of the consequences. He knows that, if found out, he will be put to bodily pain. This his nature shrinks from, and he seeks means to avoid it. If he tells a lie, he may escape punishment, and he accordingly lies. This is bad! but what else can be expected? We do not look for the heroism of martyrs in our children, and we ought not to look for it. Now all this temptation and wrong doing could and should be prevented. We would have every parent lay down as an absolute rule for himself or herself, never severely to punish a child for a fault freely and frankly confessed.

GOOD SOCIETY.—It should be the aim of young men to go into good society. We do not mean the rich, the proud, and fashionable, but the society of the wise, the intelligent, and the good. Where you find men that know more than you do, and from whose conversation one can gain information, it is always safe to be found. It has broke down many a man by associating with the low and vulgar—where the ribald song was inculcated, and the indecent story, to excite laughter, and influence the bad passions. Lord Clarendon has attributed his success and happiness in life to associating with persons more learned and virtuous than himself. If you wish to be respected, if you desire happiness and not misery, we advise you to associate with the intelligent and good. Strive for mental excellence, and strict integrity, and you never will be found in the sinks of pollution, and on the benches of retailers and gamblers. Once habituate yourself to a virtuous course—once secure a love of good society—and no punishment would be greater than by accident to be obliged, for half a day, to associate with the low and vulgar.

To produce amiability and happiness, the mind and heart must act together; they must be the impartial judges, the gentle monitors, and the kind encouragers of each other; they are dependent upon each other; and we on them.

Written for Moore's Rural New-Yorker.
NO HOME.

No home! the lamps are blazing in the halls,
The fire burns cheerily upon the hearth,
Bright eyes are beaming with the joy of youth,
And merry voices mingle tones of mirth.
No light for me! no fire—no song—no smile—
No thought of gladness whosoever I roam;
No rest for the overworn, suffering spirit—
No peace, unquiet soul! no love—no home!

No home! the sitting on the pictured walls,
The shadows of my kindred I can see;
I know their presence in my heart no longer—
Living to others, they are dead to me.
Still shine the stars in all their olden brightness,
And still the golden sunlight lints the ware,
But beauty greets no more my spirit's vision—
I mourn in darkness by Affection's grave.

No home! the leaves from out Life's opening blossoms
Have fallen, and faded, to the ground;
And while the cold winds rudely rustle through them,
I hear, and tremble as I hear, the sound.
For all too plainly do I know the meaning—
My deadened present—and for years to come
No hope to calm the rushing tide of feeling—
No refuge from my thoughts—no rest—no home!

No home! the' from unnumbered voices
The melody of joy floats in the air,
Within my soul no echoes are awakened—
No answering note of gladness lingers there.
Tho' Pleasure, Wealth, and Glory beckon to me,
I look upon them as I saw them not;
And tho' Earth's myriad beauties are before me,
My spirit murmurs "ye are all forgot!"

No home! the beacon light, so fondly cherished,
Long since went out amid the fearful strife,
And no faint ray shines through the midnight blackness
To guide me through the dangerous storms of life.
What fever in my brain! no balm of Gilead
Remains for me this side the dreary tomb—
I find no ark of safety from temptation—
No sleep from sorrow—God of Heaven! no home.

No home! my soul beyond the dreaded waters,
Which earth from the celestial homes divide,
Is it not promised, even for thee, in Heaven,
Thou blessing Heaven on earth to thee denied?
Satan, Thy aid! the way is dark and thorny—
Father, have mercy! 'tis the path He trod;
Help me! tho' faith is weak, for I am weary—
Lead me to rest! Oh, guide me home to God!

Hastings, N. Y., 1889.

ROSELIA.

Written for Moore's Rural New-Yorker.
FICTION.

THEY whose acquaintance with works of the imagination has been confined to such productions as *The Three Spaniards*, *The Children of the Abbey*, *The Mysteries of Udolpho*, *Romance of the Forest*, and other like delineations of the terrible or sentimental, and whose unfavorable judgment of these samples has led them into wholesale denunciation of fictitious narrative, have little idea of what they condemn, when they thrust aside, as unworthy their attention, what cultivated readers of the present day accept as a first-class modern novel. So deeply are the feelings of the better classes enlisted in favor of efforts for the elevation of the less fortunate, that any picture of present society which has not a strong color of philanthropy—which is not presented with an evident design to help forward some humanitarian movement, or, at least, strike down obstacles that stand in the way of reformation—seems to the thoughtful, benevolent reader, frivolous and unprofitable, even as a means of amusement. Thus, we see that the most successful novels of our time are not such as are addressed solely or chiefly to the imagination, but, rather, those that by their more or less earnest treatment of social evils, or by their keen ridicule or sad or stern reproof of the follies and hypocrisies of mankind, speak to the reason and conscience of the reading public. Even the historical tale has lost ground immensely within these last years; and, to take a signal example, though the novels of Sir Walter Scott are universally admired as productions of the past, there is reason to believe that if these wonderful creations were to-day, for the first time, brought before the world as the recent work of a living author, they would meet with far less general favor than they now receive. For, though the world is still willing to be entertained, it has a feeling that the entertainment should be of a different sort from what has until lately been furnished; caterers may find suitable, if sad material in the present unhappy condition of the less favored classes; humanity calls especially upon the novelist to portray before the eyes of the legislator and the philanthropist the limitations, the struggles, and the sufferings of her children; and could a writer of the present day, endowed with the splendid gifts that the author of *Ivanhoe* and *Kenilworth* possessed, turn a deaf ear to such a cry, he would be in danger of experiencing the mortification of seeing his works neglected as those of a cold, unsympathizing spectator of the strivings and the miseries of his fellow-men.

But not alone in its choice of subjects does the fictitious literature of to-day differ from the fashionable novels of an earlier time. Formerly, the plot was perhaps the distinguishing feature of a story; and the writer who contrived the most ingenious complication of incidents and brought it to the most unexpected though satisfactory conclusion, possessed one of the first, if not the very first qualification of a successful novelist. Such importance being attached to the plot, and it being the aim to concentrate so large a share of interest in its development, a greater number of characters than the exigencies of the story required would, of course, be burdensome; while the introduction of interesting matter, not useful in unfolding the scheme or adding intensity to the circumstances, would tend to weaken the effect of the best contrived and most skillfully worked plan.—Accordingly, we find that in novels of this description the characters are generally few and the information concerning them not extensive. We are

admitted only to an outside acquaintance. We feel that we know nothing of them except as heroes and heroines of a novel. How they came to be the persons they are, or, indeed, what sort of persons they are off the pages of a book we can scarcely conjecture. Nor do we learn much of the author except as a story-teller. No hints of his actual experience of life; no glimpses of the world as it looked to him; no intimations of what he thought of subjects of interest in his time, draw attention from what, compared with the texture of favorite modern novels, may justly be termed the thread of the narrative. Measured by the broad scenes and the substantial existences of a faithful life-picture, the mere story-teller's world is truly a stage and the men and women only players.

As the taste of the present day requires the novelist to choose a solid foundation for his work—to make it in some sort an expose of political, social, or domestic wrong—it becomes necessary for him to present his characters in their relation to surrounding institutions; and this very association gives a certain color of life and reality to them. Again, the fact that the interest is divided between the fate of the characters and the discussion of a principle admits a great degree of carelessness in the plot; indeed, we may say it allows almost a total absence of plot. This looseness of plot, in turn, admits the use of a great number and variety of characters; besides affording an excellent opportunity for the author to introduce many hints of the quality and culture of his mind in his own person. And from this latter advantage springs up another feature of the novel; a feature on which, in many cases, its chief interest and value depend. For, whether from a growing disinclination to put their happiest thoughts into the mouths of their characters, or the impossibility of so introducing them in a natural, unaffected manner, or from some other cause, novelists are crowding more and more of their best material into the parts of their work in which, as distinguished from the strict narrative, they seem to speak directly to the individual reader. Thus, we are beginning to have novels without a hero and novels, without a denouement. Works of fiction, whether of the reform or sentimental school, can no longer be judged solely by the writer's skill in drawing his characters and developing his plot—their success often depends in equal and, many times, in superior measure on the thought that is woven into the story—the classical, poetical, mythological and other allusions—the delicate fancy—the quaint conceit—the wit—the humor—the satire—the pathos—and the numberless graces that a writer of varied powers introduces to make his work something more than a bald narration of incidents or a fiery record of passion. Devourers of fiction read such books with bated speed. Linger over what may be called its more accidental beauties, they forget the tedium of waiting till the end of a long story to learn what becomes of the characters—they could even open the book at any page and read with interest—just as, in real life, we make acquaintance with people of all ages, wait, without the least impatience, for the principal events of their after lives, and oh, how willingly wait for them to die! how much longer would gladly wait than we are permitted, many times! Take, for example, *Wilhelm Meister*; a work named by Goethe a novel; but, as Carlyle truly says, possessing almost no romance-interest and having the lightest imaginable plot; yet, how overwhelming in its richness! The characters come before us in the most natural, matter-of-course way, like figures in a painting; and after helping to illustrate the genius and culture of the author, disappear from sight with scarcely diminished numbers, as families sometimes move out of a neighborhood, leaving their dead behind them, and are never heard of again.

BASEFULNESS.

BASEFULNESS is not such a common malady among young people as it used to be when I was young—a long time ago. But now and then one meets a timid boy, or maiden, too shy and bashful to take a moment's comfort anywhere. For such I always feel the utmost sympathy, and let me ask them, did you ever ask yourselves the reason, or did any one ever encourage you to feel otherwise? Nothing makes a young person appear to better advantage than a proper degree of reserve, and a modest demeanor; but these are not necessarily associated with an awkward, blushing, stammering, trembling speech and gait. If you will get rid of the idea that every one is observing you, and cultivate a sort of indifference to what every one may say or think, provided you do the best you can, could you not then appear and feel calm, easy, and be frank—willing to oblige, and not tremble, lest you should not do and look according to any particular mode?

Suppose you are homely, or deformed, or overgrown, all of which, or any of these, would be calculated to embarrass you; but reflect, that you are just as nature made you—you are just what you are, and it will only enhance your trials to be shy and reserved, and fancy people are noticing and commenting on your appearance. But every such girl, or boy, or person, has peculiar reasons, owing to circumstances, why they suffer from timidity, and such ones need a kind friend to reason with them, and raise their self-esteem, by showing them their advantages, or by encouraging them in some way, instead of being left to struggle, as many are, until time and a knowledge of the world may in a measure give them self-possession.

Cheer up, take courage, you sad, fearful, shrinking ones. The world is wide enough for us all, and there is a place for you—perchance a high one, if you dare strive for it. Will you try?

A FRIEND.

The cares and infelicities of life, which are spoken of as "hindrances to grace," may be hindrances, but they are the only helps it has in this world.—The voice of provocation is the voice of God calling us to the practice of patience.—H. W. Barker.

WEEP NOT FOR THE DEAD.

BY IDA FAIRFIELD.

Oh! not for the dead, the holy and good,
Let the tears of sorrow flow,
Too sacred and pure is the mystical flood,
To waste it in useless woe.
And they are enjoying a home of rest
In that land where care cannot come,
Give smiles, not tears, for the pure and blest
Who have now their eternal home.

Ye may weep for the living, the hearts all worn
By the impress of sorrow and care,
Who all the life of life's burden have borne,
And still the sad mantle must wear.
In your tears, perchance, may be found a balm
To bind up the sorrowing heart,
Filling the soul with a holy calm
As its earthly joys depart.

Ye may weep for the withering blight
Which the true heart often knows,
For the deepening gloom of poverty's night,
And the orphan's myriad woes;
For the feeble joys which time,
From the scroll of years, hath 'rest,
For the cankering stain which sin and crime
On the heart's pure shrine hath left.

Ye may weep for the shame and wrong,
Wrought by injustice's hand,
For the weak, who suffer from the strong,
In every clime and land.
For all earth's weary, suffering ones,
Who have meekly borne the rod—
But not for those triumphant ones
At rest in the arms of God.

THE STUDY OF THE SCRIPTURES.

I HAVE often wondered why it is that the Bible is so little studied, even by those who profess to bear the name of Christ. Aside from its literary and historical attractions, there is so much to admire in its adaptation to the wants of every individual, so much to reverence in its justice and majesty, so much to love in its mercy and simplicity, that we are at once constrained to acknowledge its authority, and to make it "the man of our counsel." But, for the believer, there is a more powerful inducement to the study of the Sacred Page. It is his Father's word, revealed by infinite love, and stamped with the unmistakable seal of Divinity. Prodigal though he may have been, wicked and unbelieving, yet that holy book has held out to him every inducement that a Father's love could devise to procure his return. And when he did return, and angels in Heaven rejoiced over his conversion, how precious became that Heavenly Message! How he delighted, at all times, and under all circumstances, to meditate upon it? If he doubted, it dispelled his fears; if inclined to wander, it warned him of his danger; if in distress, it comforted him; if sorely tempted, it promised grace to overcome; if cast down, it lifted up his broken spirit; if bereaved, it whispered of reunion; if rejoicing, every page was vocal with praise. And when Death has stood beside his couch, and stretched out over him his shadowy wings, it has brought support and comfort, and glorious triumph over the last enemy.

O, it is this adaptation to our every need, which makes the Bible so precious to us, in our earthly pilgrimage. It is our comfort in affliction, our stronghold in the hour of conflict, and our song of rejoicing in the day of victory.

Stanardsville, Va., 1889. BERTHA MORTIMER.

RICNES OF THE BIBLE.—"Book of books" is the Bible. It is a book of laws, shows the right and wrong. It is a book of wisdom, that makes the foolish wise. It is a book of truth, which detects all human errors. It is a book of life, which shows how to avoid everlasting death. It is the most authentic and outlasting history ever published. It contains the most remote antiquities, the most remarkable events and wonderful occurrences. It is a complete code of laws. It is a perfect body of divinity. It is an unequalled narrative. It is a book of biography. It is a book of voyages. It is a book of travels. It is the best covenant ever made, the best deed ever written; it is the best will ever executed, the best testament ever signed; it is the young man's best companion; it is the schoolboy's best instructor; it is the learned man's masterpiece; it is the ignorant man's dictionary, and every man's dictionary; it promises an eternal reward to the faithful and believing. But that which crowns all is the Author. He is without partiality and without hypocrisy; "with whom there is no variableness, neither shadow of turning."

LEARNING AND WISDOM.—The learned man is only useful to the learned; the wise man is equally useful to the wise and the simple. The merely learned man has not elevated his mind above that of others; his judgments are not more penetrating, his remarks not more delicate, nor his actions more beautiful than those of others. It is wholly different with the wise man; he moves far above the common level, he observes everything from a different point of view; in his employments there is always an aim, in his views always freedom, and all with him is above the common level.—Jean Paul Richter.

A VERY COMMON MISTAKE.—Many Christians imagine that, now since they have believed, they must draw their comfort from some other source, or in a different way from what they did at first; they turn their whole attention to themselves, their experiences, and their graces. Forgetting that the true way of nourishing these is by keeping their eye upon the cross, they turn it inward, and try to nourish them by some process of their own devising.—Selected.

THE TRAVELER.

LETTERS FROM A HUNGARIAN.

NUMBER SIX.

Buda (Ofen)—Monument of the late Revolution—A strange idea—Hungarian Palace—Fortress on the Blackberg—Jewish Temple—Annual Fairs in Pesth.

DEAR FRIEND MOORE:—Having returned from the *Stadion* into the center of the city, I crossed the splendid suspension bridge which connects Pesth with Ofen. Ofen, (Hungarian Buda), with a population of about 35,000, (mostly German), is built along the bank of the Danube, partly terrace-like, on two rocks. The main portion of the city forms a strong fortress which has suffered twenty sieges within the past three centuries, the last of which took place in the Revolution of '49, when the brave Magyars wrested the fort from the hands of the Austrians. The latter, in commemoration of this defeat, (or, as the inscription on the monument says, in memory of General HENTZ and his soldiers who "sacrificed their life here for Emperor and Fatherland," erected in 1862, a beautiful gothic monument of cast iron, 66 feet high, on a granite pedestal 90 feet in circumference. The six sides of the monument contain the foregoing inscription with the names of 418 "Tapferen" (valiant ones) who fell here. The inscription is evidently calculated to produce a wrong impression. One would naturally infer from it that the Austrians lost no more than 418 at the siege of Ofen; while, in fact, their loss was considerably greater. The inscription probably refers to the 418 who were killed on the spot (the *Georgi square*) where the monument is erected. A rider firmly holding the sword though sinking from his horse, while an angel crowns his head with a laurel wreath, represents the fallen defender of the fort, General HENTZ. Verily, this noble monument would have been worthy of a better cause. But it stands there, as it were, in mockery of the heroic capture of the fort by the brave Hungarians.

Speaking of this monument, I cannot help mentioning the strange idea which has entered into the minds of many Hungarians—and which some have communicated to me with the utmost assurance—that the Hungarian Revolution was, after all, secretly effected by Austrian emissaries themselves; and a few go even so far as to accuse Kossuth of having been such an emissary. This notion is based on the following reasoning:—Formerly, say they, Hungary was in every respect free, though dependent on Austria for its protection.—For this Hungary annually contributed a certain amount of money and men for the general expenses and defense of the Austrian Government. If Austria wished for more than the stipulated amount, it depended on the good will of the Hungarian people; for Hungary had its own Parliament and its National Guards, as well as many other special institutions. It thus often happened that when Austria desired a hundred thousand men for the army, or so many ducats for public expenditures, the National Parliament of Hungary would charitably consent to give one-fourth, or perhaps one-third of the desired amount. Now, as this method was rather too precarious a thing for the Austrian Government, the latter secretly fanned the sparks of dissatisfaction into the flames of rebellion, in order to reduce the Hungarians to a more thorough subjection by treating them as a rebellious people. Had not Hungary declared itself independent, Austria could never have found any pretext for forcing the former to obey all her imperial behests. But whatever probability there may be in favor of this opinion—as, for instance, the treachery of GONGER, whose already victorious army might have successfully won the independence of Hungary, had he not suddenly surrendered it—it is certain that Kossuth was no such secret emissary; his whole career, from the very first time that he engaged in politics, speaks against this assumption. The consequences of the Revolution, of course, are as favorable to the Austrians as they are oppressive to the Hungarians; a description of which I attempted in my last. But I have already digressed too far. I was speaking of Buda, and here I am speculating about the late struggle for liberty. But such is the present appearance (externally as well as internally,) of Hungary, that one can hardly visit a single spot of note, without being reminded of its recent political history.

A short distance from the HENTZ monument is the royal palace, built under CHARLES VI., the front of which (400 feet in length,) faces the Danube, commanding the city of Pesth, on the opposite bank. In one of its two wings are stored the costly insignia of the realm which were buried under ground by the Revolutionists in 1849, but were discovered again in 1853, (Sept. 8,) at the foot of the adjacent hill, Allion.

Half an hour's distance from the palace is the lofty Blackberg (765 feet above the sea,) from which the two cities, Pesth and Buda, may be most favorably viewed. In place of the astronomical observatory which existed here as late as 1852, there rises a solitary fort whose cannons command the capital of Hungary so well, that, had it existed during the Revolution, it might have prevented the Hungarians from storming Buda. Thus, the instruments of science are obliged to give way to the bulwarks of despotism. Viewed from Pesth, this fort has the appearance of a hoary monster threatening to subdue the first heaving of an insurrection in the capital.

Many another important edifice have I seen in Pesth and Ofen; but a description of them would hardly interest your readers. I will only mention the University (built in 1766,) which is visited by about 1,000 students. Among the Churches none can vie in grandeur with the celebrated Cathedrals of Vienna and Prague, or the one recently dedicated in Gran. On the other hand, the wealthy Israelites of Pesth are now rearing a Temple (synagogue with reformed worship) in gothic style, which, while it will be the most magnificent syna-

gogue in the world, will also bear testimony to the architectural skill, as well as to the wealth, of Hungarian Jews (the architect being of the Jewish persuasion, and the probable cost, when finished, nearly half a million of dollars.) Already have the gilt roofs of the two lofty towers raised the envy of some who suspected the Jews of having an underground press for making counterfeit notes. But the "children of Israel" have proved that they are not loathe to bring together their gold and their silver for the purpose of rearing a sanctuary unto the Lord, as did their forefathers in the wilderness. And thus the tablet above the main entrance is fully inscribed in letters of gold with the Hebrew verse which in our version reads:—"And they shall make me a sanctuary that I may dwell among them." (In Hebrew this verse contains only five words.)

Before closing this letter, I must speak of one important feature connected with the Hungarian Capital, viz., the four quarterly markets or fairs which take place once every season. One of these was just drawing to a close while I was in Pesth—it generally continues about two weeks. On such occasion merchants from all parts of the country gather here; some bringing with them their several wares, and displaying them in temporary booths erected for the purpose on the most frequented public squares, others (merchants on a smaller scale) visiting the city for the purpose of making purchases which, being made in cash, can be effected much cheaper here than anywhere else, or on any other occasion. Of course, the city then literally swarms with strangers; and, in the night, every nook and corner of the public houses is occupied with a temporary couch. Having occasion to visit a friend of mine, one evening, who was then stopping at a private boarding-house, I had to take great care, in passing through the kitchen, so as not to step on the heads or legs of the several strangers who lay all over the floor, content with having found so poor a night's retreat. Aside from the mercantile advantages gained by these quarterly markets, the social benefits derived from them must not be overlooked. For, during the fortnight which the stranger here spends, he visits in the evening (when all the "booths" are closed) the German and Hungarian theatres, the coffee saloons, &c., where he becomes acquainted with the life, manners, ideas (social and political) of the city folks, and applies them with advantage in the villages and minor towns, whither he returns after the "market." More anon. S. TUSKA.

SOLOMON'S TEMPLE.

MR. WILLIAMS, the editor of the *Utica Herald*, has reached Palestine in the course of his Eastern travels. The following is an extract from his last letter describing the "Holy City":

"There was one Holy place in Jerusalem I sought in vain to visit—the site of the temple of Solomon. It is as you know, occupied by the principal Mosque of the city—the Mosque of Omar.—Including the inclosure, it occupies the whole south-western part of the city, and appears to be one of the most imposing edifices I have seen in the East. Hitherto strangers have been permitted to visit it by paying a modest backsheesh of from five to fifteen dollars each; but of late the Mohammedans are growing no better fast in the matter of toleration, and this year have saucily shut the door of the sacred edifices in the teeth of 'Christian dogs.' I attempted to look into the inclosure but a Turkish sentinel offered to make me a present of the contents of a very rusty musket, while an old vagabond who stood near suggestively drew his finger across his throat, indicating by such suggestion that in case I should enter, I should for the future be relieved of the bore of carrying a head upon my shoulders.

These rascally Mohammedans have also placed some sacred edifice or other over the tomb of David, so that no Christian is permitted to see the resting place of the great Psalmist. And I may here remark that there is no sadder spectacle of this curse-stricken land than that of the Arabs, and, if possible, still more degraded Turks lording it over the sacred city. The ground once pressed by the feet of Solomon, and David, and Christ, now echoes to the tread of Moslem and Janissary and the drivelling Dervish. While the Jew is cowering in obscure places, the Moslem struts with the air of one who treads on thorns; while the Christian begs permission to kneel at the tomb of his Savior, the Turk disdainfully proclaims himself monarch of all he surveys. While the Holy Sepulchre is nominally in the hands of the Christian, Turkish soldiers keep guard at the door, and a Turkish Pasha keeps the keys."

SOMETHING ABOUT ICEBERGS.

Few sights in nature are more imposing than that of the huge, solitary iceberg, as, regardless alike of wind and tide, it steers its course across the face of the deep, far away from the land. Like one of the front giants of Scandinavian mythology, it issues from the portals of the North, armed with great blocks of stone. Proudly it sails on. The waves that dash in foam against its sides shake not the strength of its crystal walls, nor tarnish the sheen of its emerald caves. Sleet and snow, storm and tempest, are its congenial elements. Night falls around, and the stars are reflected tremulously from a thousand peaks, and from the green depths of "caverns measureless to man."

The visible portion of an iceberg is only about one-ninth of the real bulk of the whole mass; so that if one be seen 100 feet high, the lowest point may, perhaps, be away down 800 feet below the waves. Now it is easy to see that such a moving island will often grate across the summit and along the sides of submarine hills: and when the lower part of the berg is roughened over with earth stones, the surface of the rock over which it passes will be torn up and dispersed, or smoothed and striated, while the boulders embedded in the ice will be striated in turn. But some icebergs have been seen rising 300 feet over the sea; and these, if their submarine portions sank to the maximum depth, must have reached the enormous total height of 2,000 feet. By such a mass, any rock or mountain-top existing below the surface of the ocean, would be polished and grooved; and succeeding bergs depositing mud and boulders upon it, this smoothed surface might be covered up, and suffer no change until the ocean bed should be slowly upheaved to the light of day. In this way submarine rock surfaces at all depths, from the coast line down to 2,000 or 3,000 feet, may be scratched and polished, and eventually entombed in mud. It is upon this theory only, that we are able to account for the many huge boulders that lie scattered about upon the mountain, valley and plain.—*Scientific American*.

GROUP OF PEASANT WOMEN, AS SEEN IN THE STREETS OF JERUSALEM.

CONDITION OF WOMEN IN THE EAST.

IN no city on earth, perhaps, is woman found in greater variety than in the "City of the Great King." A street scene, such as may be often witnessed, is shown in the engraving. The fair ruby-lipped Circassian and the sable daughter of Ham, the fur-clad Russian and the semi-nude Bedawy of the desert, the graceful Greek and the clumsy Copt, the modest Armenian and the brazen Fellahab, the haughty inmate of the harem, and the oppressed Jewess—"from every nation under heaven." But, however widely they all may differ in blood, manners, customs and appearance, they all more or less resemble each other in at least this common point—they are the abject slaves of the "lords of creation." If then you would form a proper estimate of the lot and condition of woman in her Oriental phases, you need not go beyond the precincts of Jerusalem. Do you see that white sheet and thick veil, enveloping something, whose yellow boots suggest the idea that it may be a piece of living humanity? Shade of Eve, it is a daughter of yours! Reader, it is a sister of ours! Those black slaves are sent to hold her in vile surveillance. The lordly Effendi, the bigoted church dignitary, the panoplied soldier, and the proud civilian, all pass her without the slightest salutation, though they well know from her train that she is as respectable as a woman can be in the East. Nay, her own brother vouchsafes not the slightest token of recognition, even averting his head as he passes; and were her own husband to condescend to exchange a few words with her in public, he would be considered not only as utterly disgraced, but as having actually sinned. Cruel Turk, who

"Scorns the world,
And struts about with whiskers curled,
Keeps a thousand wives under lock and key,
For nobody else but himself to see."

He says he has bought her, and will treat her as he pleases! But, probably, you think that domestic happiness within doors may somehow or other compensate for the neglect with which she is treated in public. Ah! you have little conception of woman's sad condition throughout the Orient! Never can you say of an Oriental dwelling, as the poet has of an English cottage

"I knew by the smoke that so gracefully curled
Above the fire-tops, that a cottage was near,
And I said to myself if there's peace in this world,
The soul that is humble might hope for it here."

There is no peace in the harem. And what love can the monstrous tyrant have for one of them when his modicum of affection is divided amongst half a dozen, or half a score, or a score and a half of poor ignorant creatures? What heart-rending scenes is the sojourner in the East continually compelled to witness, flowing from the abominations of the harem system! Yet the instance cited is the very brightest picture of Oriental female life which can be portrayed. For these poor creatures' husband, if indeed he can be called husband whose conjugal affection is divided amongst so many, or rather bestowed upon none, is able to support his ample household without requiring any labor at their hands.

But how widely different is the case when they are compelled to labor for their own support and his! Take another illustration, then—one from the lower walks of life. You see that one-robed woman, with tattooed face and narrow little bead-adorned veil, concealing nose, mouth and chin, while most of her person is as much exposed as Grecian sculptor could desire; she truly has a hard lot. She is bringing vegetables to market. She planted the seed; she worked the ground; she gathered the crop, and now she must make sale of them, or else what is to become of that little fellow that rides astride her shoulder, and the babe that swings in the knapsack that hangs on her back? For her brutal husband spends the live-long day lounging in the idle group at the gathering-place of the village. Besides her own heavy cargo, she drives the donkey before her to the city, well loaded with the produce of her own industry. But does she venture to ride him back? Not she! 'Twould cost her a sound drubbing to do so. But you see her lord and master seated upon him leisurely smoking his pipe, while his help-meet carries two children and a basket.

Ladies, sympathize with your sister, for you borrow from her the present style of flowing sleeve, which you admire so much; but you do not "go the whole figure," for you will discard in a few weeks more what has been worn in the East for perhaps three thousand years. She wears it three or four times the length of yours, and either ties it around her neck, or covers her uncombed head with these useful appendages, and they thus serve the quadruple purposes of sleeve, cape, bonnet and handkerchief. But alas! poor thing, while she may wear that robe like

"Beauties by Sir Peter Lelie,
Whose drapery hints, you may admire them freely."

suppose she were so unfortunate as to be caught without that nose-and-mouth-hiding veil,—such shameful immodesty would in all probability call down, not only the bitterest ire of her devoted husband, and the reproaches of the neighborhood, but a sound drubbing besides. In what durance vile are we bound, by custom on the one hand, and impelled by fashion on the other! But query,—which is worse, to be wedded to such a brute, or to fashion? Who can say which is the most tyrannical, arbitrary and capricious?

Now if such are the civil and social disabilities of woman in the East, how much more the mental and moral servitude under which she groans and toils, despairs and dies! Should we not, henceforth, evince more gratitude to the "Author and Giver of all Good," than we ever yet have done, for the distinguishing privileges we enjoy in this western world; and not only so, but, in view of our great responsibility, should we not give proof of our gratitude, by extending relief to our less favored sisters in eastern climes?—*Hadiji in Syria*.

GEOGRAPHICAL ENIGMA.

I AM composed of 20 letters.
My 1, 20, 15, 8, 3 is a county in North Carolina.
My 2, 12, 4, 7, 6, 17, 12, 10, 20, 10 is a city in one of the Southern States.
My 3, 17, 5, 18 is a river in Europe.
My 4, 12, 17, 17, 15 is a town in England.
My 5, 18, 6, 1, 18 is a town in Switzerland.
My 6, 8, 9, 18 is a capital in Europe.
My 7, 16, 3, 19, 2, 1 is a county in Michigan.
My 8, 16, 18, 1, 20 is a large body of water.
My 9, 1, 20 is an island in the Irish sea.
My 10, 19, 17, 12, 9 is a town in Massachusetts.
My 11, 8, 15, 18, 6 is a river in Europe.
My 12, 5, 6, 8 is a river in Spain.
My 13, 17, 5, 1 is an island in the Mediterranean sea.
My 14, 19, 17, 6, 10 is a cape on the coast of Spain.
My 15, 1, 5, 17, 12 is a cape on the coast of the United States.
My 16, 17, 1, 6, 19 is a river in Sweden.
My 17, 18, 8 is a county in Virginia.
My 18, 2, 10 is a river in Austria.
My 19, 9, 6, 7 is a river in Toorkistan.
My 20, 1, 14, 17, 8, 15 is a river in Europe.
My whole is an old saying. A. WELLS.
Charlton, N. Y., 1859.

Answer in two weeks.

MISCELLANEOUS ENIGMA.

I AM composed of 18 letters.
My 1, 4, 5, 9 is a British title of nobility.
My 2, 4, 5, 12, 4, 7, 11, 11 is the surname of a member of Congress.
My 8, 12, 11, 18 is a species of birds.
My 4, 9, 7, 11, 12, 16, 7, 17, 10, 18 is a distinguished U. S. Senator.
My 7, 9, 8, 11 is one of the seven colors.
My whole is an eminent English politician.
Mount Vernon, Mich., 1859. J. MILTON JOHNSTON.

Answer in two weeks.

ARITHMETICAL PROBLEM.

Required the dimensions of the largest cubical box that can be made from a board containing 151-18 square feet; the board being one inch thick, and the thickness to be retained when the box is made. Required, also, the shortest method of solution. MARY.

Nunda N. Y., 1859.

Answer in two weeks.

THE ELASTIC EGG.—Take a good and sound egg; place it in strong vinegar, and allow it to remain twelve hours; it will then become soft and elastic. In this state it can be squeezed into a tolerably wide-mouthed bottle; when in, it must be covered with water having some soda in it. In a few hours this preparation will restore the egg nearly to its original solidity, after which the liquid should be poured off and the bottle dried. Keep it as a curiosity to puzzle your friends for an explanation how the egg was laid in the bottle.

ANSWERS TO ENIGMAS, &c. IN No. 481.

Answer to Mathematical Problem:—127 sheep.
Answer to Geographical Enigma:—The worst of slaves is he whom passion rules.

YOUNG RURALIST.

ARITHMETICAL CALCULATION.

MESSRS. EDITOR:—ORPHEUS, in the *Young Ruralist*, of Feb. 19, asks "why, dividing a number makes it larger, &c." Allow me to say in reply, that it will not, unless the divisor is less than a unit—1.

ORPHEUS divides 1.0096 by 004—that is, he separates a unit into a thousand parts, and for a divisor, takes four of them, thus 4-1000ths, or thus .004—as decimals are generally written. Now, by reducing the 1 in the dividend to thousandths, it will be of the same denomination as the divisor, and the division will be easily accomplished as far as the thousandths extend in the dividend. Here allow me to say that it is impossible to divide one denomination another, without first assimilating them, virtually or in reality. Proof—divide a hundred pounds of butter by four quarts of molasses. But to return to the example. If we divide one thousand and nine thousandths by four thousandths, does it follow that the answer must be in thousandths, also? Of course not; and this is what mystifies many besides ORPHEUS. To illustrate,—suppose we cut an apple into twenty equal parts. The question then arises—how much greater are ten of those parts, than five of them. Any one can see that they would be twice as large and not two tenths.

To illustrate this a little further, and to explain the unit point, let us go on with the first example which ORPHEUS gives. Considering the 1 as reduced to thousandths, we get along nicely until we divide the 9, which is the last figure in thousandths, and, consequently, the last that will contain the divisor a whole number of times. Represented thus,

004)1.0096

252.

As the point is only a mark to separate the whole from the fractional numbers, it falls after the 2, as above. After dividing the 9 we have one remaining, which reduced to ten thousandths and added to 6, already in that place, make 16. Making the divisor of the same kind and then dividing, we have 16-40, or 4-10—the same result that would be obtained if we divided straight through, as in whole numbers. The "reason" why the point is placed as it is, is this, we cannot divide any number by one greater than itself and receive whole numbers for an answer; or in other words—when we get to the last figure in the dividend which is of the same order as the last figure in the divisor, we must "point off" the rest of the quotient for a decimal.

If ORPHEUS, and others, understand what has already been explained, they will have no trouble in seeing why multiplying a number by less than 1, makes the product less than the multiplicand; and also, why the point is placed accordingly.—Will ORPHEUS accept my thanks for his explanation of the circle? Humo, Allegany Co., 1859.

FALSE PHILOSOPHY.—Some years since I read a lecture by a professor of Philosophy, on the subject of attraction. He attempted to prove the attraction of gravitation, by saying that the center of two balls, suspended by two lengthy cords, would be nearer each other than the cords would be at the top. I would not take it upon me to say, positively, that this would not be a reason, but think it is not the reason. Any two perpendicular lines, are not parallel lines. All perpendicular lines, pass directly to the center of the earth, and therefore verge towards each other, like the spokes of a carriage wheel. The walls of a stone or brick house must lean slightly in or it will be larger at the top than the bottom.

Many suppose that east and west lines drawn upon the surface of the earth, are parallel straight lines. This is not the case. Indeed, a surveyor cannot start from a given point and run one mile west, thence east one mile, and strike the point he started from. Will VENTRAS give an explanation of this.—W. R., Moravia, Cayuga Co., N. Y.

ADVICE TO "WOLVERINE."—If "WOLVERINE," of Macomb Co., Mich., will correspond with me, will give him my experience in full. I bound myself out to a farmer when 17 years old, and lived with him till 22 years old. I could give WOLVERINE some good practical advice. I would fully endorse your advice in the *RURAL* of the 12th inst. Still, he should have three months' schooling (60 days) each year, board, clothing, a moderate amount of spending money, and when of age one hundred dollars. However, I repeat, with you, that a home in a good Christian family, with an enterprising, early rising farmer, is much better than to work from place to place by the month, even if he gets only his board, clothing and schooling.—C. A. HAWLEY, Box 1662, Chicago, Ill.

GOOD FOR EVIL.—Euclid, a disciple of Socrates, having offended his brother, the latter cried out in rage,—"Let me die, if I am not revenged on you some day or other." Euclid replied,—"And let me die, if I do not soften you by kindness, and make you love me as well as ever."

If a truth be established, objections are nothing. The one is founded on our knowledge, the other in our ignorance.

There is only one objection to people who "mean well," and that is they never can spare time to carry out their meaning.

Nothing establishes confidence sooner than punctuality.

YOUTHFUL rashness skips like a hare over the meekness of good counsel.—*Shakespeare*.

No man can avoid his own company—so he had best make it as good as possible.

To keep your own secrets is wisdom, but to expect others to keep them for you is folly.

He is armed without, who is innocent within.

The News Condenser.

- The total tonnage of the U. S., June 30th, 1888 was 5,049,808.
- A Mount Vernon Association has been started in California.
- The cost of the canals in the U. S. is estimated at \$173,000,000.
- A horse died last week in Springfield, Ill., from hydrophobia.
- A convention of saw-mill owners is to be held at Oareport in April.
- Gov. Morrill, of Maine, has designated the 21st inst. as Fast Day in that State.
- A vein of iron ore has been found in the yard of the Clinton, N. Y., prison.
- John Correll, of Elk, Iowa, was recently fatally injured by his buck sheep.

BY JOHN A. WATKINS.

Happy is he who heareth
The signal of his release,
In the bells of the Holy City,
The chimes of eternal peace!

But she was not quite herself, as I could see more plainly than they. She came to me that day and told me all. I was ready to burst out in indignation against what I thought a cruel deception, but she put her hand firmly over my mouth, saying:

I seldom spoke to her on such subjects as love and marriage; for I felt that to a disposition like hers it would be nugatory. She had such a loving heart, such a nervous sympathy, that if unsatisfied often turns to bitterness. To any hint of mine she generally replied, "O, Fanny, that is not for me. No one will ever want me, or if they did, they will not want me freely, to whom, henceforth, my life must be devoted." Or, it would be, "Plaw—Fanny, you are partial and blind, too, I fear. Who but you can see either virtues or claims in the poor, plain schoolmistress, who is never young or gay?"

And so she would go away with a sweet, holy calm in her eyes, and a rather mournful attempt at a smile playing around her calm, small mouth. Thus she has gone on to this day, for she is living yet. Her mother is long since dead, so are two of her little flock. I call them hers, for she was father and mother both to them. She is a teacher still, one of the most beloved and influential. She is in "the afternoon of life," but it is a beautiful, a sunny afternoon to her. One by one the little ones have grown out of the need of her care, who, through every trial, has sustained and guided.

AGRICULTURE. HORTICULTURE. RURAL LIFE. EXCELSIOR. LITERATURE. SCIENCE. ARTS. NEWS.

TWO DOLLARS A YEAR.

"PROGRESS AND IMPROVEMENT."

[SINGLE NO. FOUR CENTS.

VOL. X. NO. 16.]

ROCHESTER, N. Y.,—FOR THE WEEK ENDING SATURDAY, APRIL 16, 1859.

[WHOLE NO. 484.

MOORE'S RURAL NEW-YORKER,
AN ORIGINAL WEEKLY
RURAL, LITERARY AND FAMILY NEWSPAPER.
CONDUCTED BY D. D. J. MOORE,
With an Able Corps of Assistants and Contributors.

TERMS, IN ADVANCE:

TWO DOLLARS A YEAR—\$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for \$5; Six and one free to club agent, for \$10; Ten, and one free, for \$15. Fifteen, and one free, for \$22; Twenty, and one free, for \$28; Thirty-two, and two free, for \$40, (or Thirty for \$37.50.) and any greater number at same rate—only \$1.50 per copy— with an extra copy for every Ten Subscribers over Thirty. Club papers sent to different Post-offices, if desired. As we pre-pay American postage on papers sent to the British Provinces, our Canadian Agents and friends must add 12½ cents per copy to the club rates of the *RURAL*. The lowest price of copies sent to Europe, &c., is \$2.50—including postage.

THE POSTAGE ON THE *RURAL* is only 3½ cents per quarter to any part of this State, and 6½ cts. to any other State, if paid quarterly in advance at the post-office where received.

All communications, and business letters, should be addressed to D. D. J. MOORE, ROCHESTER, N. Y.

WHAT IS TO BE DONE?

SPRING is upon us. The great struggle is about to commence. What the hands find to do, should now be done with all the might. But the hands, unless directed by a wise head, work in vain. It is not he who labors the hardest who accomplishes the most. Many a hard working farmer spends half his strength for naught. A little thought will save many a hard and useless day's work. Many an intelligent farmer's boy, seeing how little good results from the hard toil of his father, becomes disgusted with farming and resolves to seek some easier method of getting a living, not being able to see that the difficulty is in want of proper management. First determine on the object to be gained, then decide on the best possible means to accomplish the end, and the labor will be easy. Every movement will be one step towards the desired result; its effect will be seen and encourage to continued exertion. Nothing is more discouraging than laboring without an object. Every farm laborer, and particularly the boys, should be told not only how work is to be done, but the object of doing it thus.

Here, kind reader, we have given you a little bundle of truths, gathered from our experience and observation, and they are so reasonable that we believe you will accept them as axioms, which no reasoning or proof could make plainer. Scarcely a season passes that we are not more impressed with their truth. Last summer in making a ramble among the farmers, as was our wont, we stood in the hay-field of one who, by dint of hard work, and a good soil had managed to get along tolerably well, in spite of bad management. All hands were at leisure. The horse-rake had broken, and as the weather was a little unsettled it was not advisable to cut down more, for fear of rain. It was a little shabby the previous year, and should have been fixed, but it was not, and he thought after all it might go through another harvest. So a good portion of the day was wasted, but the boys were told that next day they must work from sunrise to dark, to make up for lost time. The intelligence that they would have to overtax their powers on the coming day, produced no pleasant reflections, no cheerful smile. But we need not multiply evidence of the truths we have presented—they will recur in abundance to every thinking man, and we will return to the question at the head of this article. What is to be done?

Our Seasonable Hints and Suggestions, of last week should be read by all, as on their observance depends, in a great measure, whether success or failure—profit or loss—well-regulated and therefore pleasant labor, or toil without compensation—is the lot of the husbandman. These we will take for granted, have been heeded, and therefore so much has been done.

About Corn we have little to say not generally known to farmers. It is a great waste of labor to try to raise a crop of corn on poor land, without manure. If this material was scarce we would use it in the hill. Corn planted three feet one way by sixteen inches the other will produce one-third more than if planted three feet each way. But then the cultivator could be used only one way. Whether the extra crop would not more than compensate for the labor, we leave for our readers to say. The *Improved King Philip*, the *White Egg* and the *Red Island* *Pomona* are well

spoken of by many farmers, and are at least worthy of trial. The latter we planted last year and were well pleased with it. It is fine in appearance, bore us a good crop and ripened early. A correspondent writes us: "I have tried most of the new kinds of corn, and must say that I find nothing better than the *Dutton*, *Eight-Rowed Yellow* and *Red Streak*, and if these varieties are grown so as to mix freely, I like it all the better."

What shall be done about *Growing Food for Stock*? Did we wish to keep or fatten a large number of cattle on a small farm, and make the most of their manure, we would cut their green feed to a great extent at least, and also endeavor to grow some plant for dry feed in the winter that would produce more than either Timothy or Clover. A gentleman stated during a discussion at the last New York State Fair, that he had grown Western corn for fodder, and produced at the rate of twenty tons to the acre when cured. Taking one-half of this amount as an average yield, what an amount of winter feed for stock could be grown on five acres. If to this was added an acre or two of carrots or parsnips, or perhaps an acre of each, how much more stock could be kept on a small farm than in the usual way of growing a ton or a ton-and-a-half of Timothy or Clover, and thirty or forty bushels of corn. Two hundred bushels of carrots are equal in nutrition to 1½ tons of hay, so that 600 bushels of carrots, which is not a large crop, is equal to 4½ tons. *Hungarian Grass* is said to produce six or more tons to the acre of the most nutritive food on new prairie soil, but we have no idea that such crops could be grown here. In deciding what is to be done the present spring, it will be well to consider the best means of growing a large amount of feed for stock, for we are satisfied that, under present circumstances, stock-growing and fattening is one of the most profitable employments in which the farmer can engage. We look for improvement in American farming mainly in this direction.

ABOUT DEEP AND SHALLOW PLOWING.

EDS. *RURAL*:—I'm in trouble—in fact almost driven to despair. Only think of it; here I have been the last ten years—yes, for my whole life time, in fact, under the impression that deep plowing was one of the essential requisites of good farming. Acting upon this impression I have been for the last ten years gradually deepening my soil, by plowing a little deeper each time, till I have got down nine, ten and even twelve inches deep, and still going down. I have got this impression by reading such agricultural papers and books as I could get hold of—by listening to the teachings of our best farmers, and I often think of the saying of "Poor Richard" to

"Plow deep while sluggards sleep,
And you'll have corn to sell and keep."

I commenced on a piece of land that had been farmed on the skinning system, by plowing four or five inches deep, and, as I said before, I have been plowing deeper and deeper, and as my crops have been gradually improving from year to year, I fancied it was owing, in a measure, at least, to deeper plowing. Judge of my surprise then, Mr. Editor, on reading the following in your issue for March 26th, from "S" of Trumansburg, N. Y.:—"On a large proportion of land in our State, deep plowing for corn is not advantageous. Experience, and the well known fact that the roots of corn are always found near the surface, demonstrate it."

You may believe those two little sentences set me to thinking—that is, after I got a little over my amazement, so I could think. I thought if those sentences were true, that after all the labor bestowed, the horse flesh wasted in plowing deep, that like enough I had been injuring my land instead of benefiting it. I began to think whether it was a "fact" that the roots of corn are always found near the surface." I thought of plowing up corn stubble the other day for oats, and while so doing I stopped my team to rest, and sat down on the plow beam to rest myself. While seated there I amused myself by pulling up corn stubbles and examining the roots, noticing how very numerous and long they were and how they spread out in every direction, and how they descended down even to the bottom of the furrow. That was before I had read the article referred to, and my conclusion then was, that there was evidence in favor of deep plowing, for those roots ran down at least ten inches. Was my conclusion wrong? That is the question that puzzles me.

I looked anxiously for the next *RURAL*, hoping to find something in it to help me out of my great quandary. But, alas! in the next *RURAL* I find the following, which, instead of helping me out of my difficulty, serves to cast still greater gloom over the "spirit of my dreams."
"W. J. F.," in speaking on this subject, says:—"In practice, we often see the farmer, who inverts

only the small portion of his farm which lies near the surface, reaping larger crops and with more profit than his neighbor who inverts his farm a good way down towards the center. The hard subsoil, miring in winter and baking in summer, is not, after all, just the right food for plants. He finds, too late, that he has turned his farm up-side-down, and lucky is he who does not find himself turned off before he can get it "right-side-up" once more."

Now, Mr. Editor, is there any hope for me? Can you say anything to give me the least encouragement? Is there any soil that will bear deep plowing? and if so, what kind of soil is it? I hardly dare plow any more till I hear from you. Do write "S" and have him tell us what soil, if any, to plow deep. I shall be in a perfect agony of suspense till I know. And, by the way, I wish while you are about it, you would urge upon your correspondents generally, the necessity, in relating their "experience" and experiments, of giving as precisely as possible, the nature and characteristics of the soil operated upon and written about. By so doing readers would be much better able to judge whether such treatment would answer in their own case. To act on this hint, I will begin by saying that I am working fine plain land; soil, a sandy gravelly loam; what few stones there are, are mostly "cobble stones." The subsoil is pretty much the same as the surface soil, except the vegetable matter.

This question of deep or shallow plowing, is one of vast importance to every farmer, for no man will be fool enough to plow twelve or sixteen inches deep, after he finds it is just as well or better to plow only four. It seems to me that the question might be solved to a demonstration on particular soils. I have no idea from what little I know of "hard pan" subsoil, that crops would be particularly benefited by bringing any quantity into immediate contact with them. Nor would I recommend bringing much of any kind of subsoil up at a time. "Little by little" has been my motto and practice.
JOHN F. OVENSHERE.
Athens, Bradford Co., Pa., 1859.

REMARKS.—As the subject discussed by Mr. O. is being thoroughly ventilated by our correspondents, we leave it, for the present, in their hands—not doubting that the truth will be elicited. It may be proper to remark, however, that we do not endorse all the opinions and conclusions of correspondents—especially those who oppose deep plowing on all soils—though we allow them to give the whys and wherefores of their respective theories.—Ed.

GLADDING'S HAY ELEVATOR.

THE above engraving is intended to represent a Hay Elevator, or Horse-Power Pitch Fork, patented last season by C. E. GLADDING, of Troy, Pa. The inventor claims that "this Elevator possesses many important advantages over all other forks, among which are the following:—The times being allowed to drop to discharge its load, the tilting of the handle, as in other power forks, is avoided; hence, hay can be unloaded with the utmost facility and ease into shed windows or beneath purlin beams, and many places where other horse forks cannot be used. The Elevator can in all cases be managed with greater ease than any other horse fork. It is also well adapted to stacking. With this fork a ton of hay can be unloaded in from five to seven minutes." This Elevator received the first premium, after thorough trial and competition, at the last New York and Pennsylvania State Fairs.

In company with several practical farmers and mechanics, we witnessed a trial of this Elevator a few days since, and were highly pleased with its operation, as were all present who expressed any opinion. It unloaded about a ton of hay, placing it in the loft of a livery stable, (the wagon standing in the street,) and pitching through a small door, doing its work in a very perfect and expeditious manner. From this test, in a difficult place, we are satisfied that the Elevator is a valuable labor-saving invention—the best machine for the purpose within our knowledge—and therefore commend it to the attention of all interested. It must prove a decided acquisition in the haying season, when both time and labor are money. For price, &c., see advertisement.

SIMMER, OR WOOD DUCK.

WHITE AYLESBURY DUCK.

AYLESBURY AND WOOD DUCKS.

AMONG all the beautiful water-fowl that it has been our pleasure to behold, either wild or domesticated, we know of none the equal of the *Summer* or *Wood Duck*, in beauty of plumage. The bill is red, the head deep, glossy metallic green, edged with violet, with a most striking and beautiful pendant crest gracefully curving over its back, of a most charming admixture of violet and green, with a line of the purest white running from the upper mandible over the eye. The back and tail are blue and green, throat white, breast delicate dove color, spotted with white. It has often been a matter of surprise to us that this bird has not been more generally domesticated, as it can be very readily. Mr. VASSAN has them at his place near Poughkeepsie, and we understand has hatched several broods.

Its popular name of wood duck is derived from the fact that it makes its nest in hollow trees; and of *summer duck*, from remaining with us during the summer. It is only seen in the North during the summer months, migrating Southwardly with the cold weather. It is familiarly known in every part of the United States from Florida to Lake Ontario, and is found about the creeks, bays and rivers. It rarely visits the sea shore or the salt marshes, its favorite haunts being the solitary, deep and muddy creeks, ponds and mill-dams of the interior, making its nest frequently in some old hollow tree that overhangs the water. The wood duck is equally well known in Mexico and many of the West India Islands.

Here they begin to lay early in May, and the nest is usually found secreted in the hollow of a tree.

Of white ducks, the Aylesbury is the best, and is very pretty, with its snowy-white plumage, yellowish legs and feet, and flesh colored bill. It is also large—one of the largest of the duck family—and excellent for the table. The name is derived from the town of Aylesbury in England, in which neighborhood they are kept in large quantities for the supply of the London market. BEMENT says:—"The weight of the adult Aylesbury duck should at least average, if properly fed, from ten to twelve pounds the pair (duck and drake). Instances, however, have occurred where the drakes have come up to eight pounds and upwards, and would in all probability, if fattened, reach ten pounds each. They are very prolific layers. From two of these ducks 800 eggs have been obtained in the course of twelve months; in addition to which, one of them sat twice, the other only once, the three nests giving thirty young ones. The eggs vary in color, some being white, while others are of pale blue. As a farther recommendation for them, in an economical point of view, it is argued that their consumption of food is less than that of the common duck; and another advantage may be found in their comparative silence from the continuous "quack, quack, quack," of the latter bird. They also attain greater weight in less time; and, from their superior appearance when plucked, are a far more marketable article.

THE "ADVISORY BOARD" DEFENDED.

MR. MOORE:—I have noticed by reading the *RURAL* and other kindred journals of late, that you and your contemporaries have become excited and very uncivil towards your old friends, the "intelligent agriculturists." You have heretofore praised and flattered us until we began to believe we were the very "bone and sinew" of our country—in fact that we stood at the head of the pile, and that all other classes were beneath us, and dependent upon us even for their bread and butter. You now attempt to hurl us from our supposed elevated position, and place us at the bottom with "scientific agriculturists and terra-culturists," and the only apparent reason for this great change in you is just because "one or more" of us "from the different sections of the Union" were invited to join a branch of the "Kitchen cabinet" at Washington, and "fare sumptuously" as long as "twenty-five dollars" would last. For no other reason than having been thus honored, you now, notwithstanding your former praises, try to make out after all that we are nothing but a set of scientific numskulls.

As my object in writing this letter is to present the truth in such a light that you will be convinced of your error (and of course acknowledge the same,) I will make a fair and plain statement of the case for your consideration.

It is well known that for many years there has been a department of Agriculture attached to the Patent-Office, supported by national funds, that this department has been under the control of the Commissioner of Patents, and also that a large amount of money has been spent yearly in collecting and disseminating seeds, plants, &c., and in publishing an annual report. It is equally well known that, after all this great expenditure of money and brain power, the agriculturists have not been benefited in the least thereby.

It would now appear from the plans adopted by the present Commissioner that he has become convinced that all the efforts heretofore made by his department to aid and instruct the tillers of the soil had been futile, has determined at once to change his advisors and assistants from "eminent" to "intelligent agriculturists," and thus, if possible, effect a thorough reform. To this and

he "resolved upon inviting from the different sections of the Union one or more intelligent agriculturists," (mark the language,) skilled in the various branches of rural industry, to convene at Washington, with the view of imparting a knowledge of such facts in practical husbandry as may have come within their experience and observation, and to suggest means by which our crops may be increased, improved in quality, or made more profitable to the producer." Those invited were to be furnished, before the meeting, with "interrogatories and blanks to enable them to record facts" at home while their farm and field books were before them.

All these "intelligent agriculturists" that had trusty help to care for their stock during their absence assembled at Washington at the appointed time, and were introduced by the Commissioner to the President as "a body of practical agriculturists." Furthermore the President, in his speech to them, said he was "happy to see so many practical agriculturists who understood that science fully"—who had heretofore "staid at home and minded their own business." He then introduced them to Miss LANE as the farmers to whom she was indebted for her bread and butter.

Now, Sir, if you are not convinced from reading the above of your gross error in calling the "Advisory Board" a set of "visionary theorists, terra-culturists, and self-dubbed professors," just look at their distinguished titles. Why, Sir, of the forty-four that assembled, a dozen or so were Honorables, the rest were Drs., and Esqs., Colonels, and Majors, with one Ex-Governor, one Rev., one regular Professor of Agriculture, and last, but not least, one Agricultural Editor; and so far as I can learn the very lowest title belonging to any individual invited, is that of Captain in the Michigan Militia. Who would have thought that the whole flock and trowsers regiment contained so many titled individuals? Verily, the dignity of agricultural labor is looking up!

But it is not enough that you and your contemporaries should apply such vile epithets as the above mentioned to these titled "intelligent agriculturists," who, under your teachings, have become "skilled in the various branches of rural industry"—you must go even further. While one intimates that the time of this "Hon. Advisory

Board" will be spent in devising some scheme to rob the national treasury, and another that it will be in making an analysis of the "Dioscora Bata-tas," you, to out-do all others in the bitterness of expression, say it will be in uttering such to us "beaten Greek" phrases as "phosphates and super-phosphates, chlorides and anti-chlorides, ammonia," &c.,—words you have never taught us to use, and such as intelligent, practical agriculturalists never utter nor ever will until they understand their meaning better than those would-be teachers whose mouths are always full of them.

Now, Gentlemen Editors, though the doings of the "Advisory Board" have not been made public, the Commissioner has revealed enough for us to know that you are wrong in all your inferences and conjectures. He also gives us to understand the true nature of the advice given him. He says in his closing address, speaking of the results of the deliberations of the Board, "It is our confident expectation that these results will tell upon the pages of the forthcoming Agricultural Report of this Office, in such a manner as to challenge the respect if not the admiration of the public, and silence the clamors of those who have so ruthlessly assailed what they have so little understood."

Now, from the above language of the Commissioner, and from the known views of the class from which the Board was selected and the public generally, we are prepared to present a true outline of the advice given as it stands on the concealed record. It no doubt runs nearly thus:

"Mr. Commissioner—We are deeply sensible of the honor you have conferred upon us in selecting us as your advisors, but as the President has truly said in his address to us, we are 'farmers, who have heretofore staid at home to follow the plow and mind our own business'; we are consequently honest men, and notwithstanding we have inhaled some 'gas' since we have been here, we must express our honest convictions. We believe that you and your predecessors have done all that could be done by your department to aid the agriculturists, but such has been the incompetency of your assistants that you have failed in all your efforts. We have examined your annual reports, (though they seldom fall into the hands of farmers,) and have found so much matter that is foreign to the subject, or that is above our comprehension, that the volumes are of no more value to us than the same number of our rural almanacs. And as to the seeds, plants, &c., distributed among us, the knowledge of our profession is so limited that we can derive but little profit from any of them. We have tried the mixture of wheat, chess, cockle and wild onion seed obtained for us 'from the ruins of ancient Troy,' but as there is at present no way to dispose of such mixed farm products to advantage, we prefer to raise wheat instead, and that, too, of a variety we have not before tested, and condemned. We have tried to raise our own tea from seed 'procured in China,' but cannot make the business profitable. We have tried to raise plums from the stones obtained for us in 'England,' but as dried plum stones do not always vegetate, nor always produce fruit of their kind, we prefer to propagate from scions, especially when they are old varieties that are growing in our own orchards! We have, it is true, received some good varieties of common garden seeds, but as they are not sure to vegetate, nor as true to name as those raised by ourselves, or as those we purchase of seedsmen, we prefer to raise or purchase our own supply. We have fairly tested many other seeds and some plants forwarded us, some of which have proved of moderate value, but we have been imposed upon so often by dishonest cultivators who have made a business of growing seeds for sale from the worthless ones received from the Patent Office, that the results altogether have not been to our advantage."

"Now evidently there has been an error somewhere. Either you have not known what our necessities required, or we have not 'understood' our profession well enough to avail ourselves of the benefits you have placed within our reach. But, whichever party is responsible for the disastrous results thus far, we earnestly protest against burdening the mails any longer with tons of, to us, useless trash, and then taxing us, as is contemplated, for the same by raising our letter and other postage."

"We therefore advise (as wisdom may die with us) that the answers we have appended to your 'fifteen hundred interrogatories' be published in newspaper or pamphlet form, and distributed among those who are directly interested in the cultivation of the soil; and then let the Agricultural Department of our Government be abolished, or at least suspended until knowledge has increased to such an extent that men can be obtained to assist you in your duties who have learned that men cannot impart instruction to others upon subjects that they are entirely ignorant of themselves. Follow this advice, Sir, and you will 'challenge the respect if not the admiration of the public, and silence the clamors of those who have so ruthlessly assailed what they have so little understood.'"

From the light we have upon the subject, there can be no doubt that the above is in substance the advice given the Commissioner by the intelligent, practical, honorable, titled Advisory Board—so here I rest my case with the firm conviction that you will never again "so ruthlessly assail what you have so little understood."

Sincerely yours, LINUS CORN.

Troy, Mich., March, 1859.

IMPROVED STABLES FOR CATTLE.

FRIEND MOORE:—As I wish to be not only a reading but a practical farmer, I desire to exchange information with practical men; so, for a commencement, I will give a description of a new mode (to me at least) of stabling cattle.

The barn I examined was in Morris, Otsego Co., N. Y., owned by two wealthy farmers—A. C. MOORE and R. FRANCOR. They have been in operation some years and give good satisfaction, and others have concluded to follow their example.—The first one on this plan has been in use some 15 years, from which others took pattern. They are as follows:—A basement for thirty cows should be some 40 by 75 feet, with a place for water. On one side are stalls, which should number one more than the cattle. They are 2½ feet wide, raised near 20 inches, and are accessible by two stairs or steps; length of stall 5 feet, but the partition

HALL'S THRESHER AND SEPARATOR.

"Above we give a very good representation of 'Hall's Rochester Thresher and Separator,' as furnished by JOSEPH HALL, of this city, who has been engaged in the business of manufacturing Threshers, Separators, Horse Powers, &c., for over thirty years, and whose machines are favorably known over a large portion of the Union and Canada. Those of our readers interested are referred to Mr. H.'s advertisement in this paper.

Our Canadian readers will observe from Mr. HALL's announcement that he has established a branch in their midst—having leased the extensive works of the Oshawa Manufacturing Co., and already commenced operations. He will manufacture threshers, separators, powers, &c., the same as in this city, and, having fifty men already at work, purposes to complete a large number of his celebrated threshing machines before harvest.

Condensed Correspondence.

Fast Corn-Husking.

MR. I. W. NEEDLES, of Union Township, Licking Co., O., husked on the 13th day of Nov. last, one hundred and twenty bushels and four lbs. of corn 70 lbs. to the bushel, (the customary weight of rolling corn at that time.) The corn was not very good, yielding only about 70 to 75 bushels per acre. It was on the stalk, but not topped. Time of husking 9 hours 45 minutes. Was husked and weighed in presence of from four to six men. Mr. NEEDLES is not one of those men "sitting about the corners and bragging," but a worker and a reader.—H. S. MANON, Hebron, Ohio, 1859.

A Trap for Prairie Hens.

IN THE RURAL of the 2d inst., F. L. inquires for the best plan for a trap to catch prairie hens. Having had a little experience in trapping prairie hens I will give my plan for a trap. I make a box three feet wide by four or five feet long, with slats across the top. Instead of a board across one end, I make something similar to a rake head, and hang it on leather hinges so that it will swing in. A couple of stakes driven in the ground at each end of the head will prevent its swinging out. The rake head should be made very light. By scattering grain both in and outside of the box, the chickens, in their eagerness to get the grain, will crawl under the rake, and when in cannot get out. By this means a large number can be taken and kept any length of time for use.—M. HEARNICK, Hammond, Wis., 1859.

To Make Hens Lay.

FOR THE benefit of F. L., who wants to know why his hens don't lay—also the best and cheapest food for them during winter—I take the liberty of expressing my opinion. He says his hens consist of Shanghaes and Brahmas. My experience in the henery is, Shanghaes, nor any other of Asiatic breeds, can be made to pay, unless kept merely for the table. I think that, for laying qualities alone, none are superior to the Creoles, and by crossing those with the Black Spanish, or most any other breed of medium size, you have a fowl fit for the table and of excellent laying qualities. During the past winter I have had thirty hens which are half-blood Creoles. I think the number of eggs which have been laid by them has not been exceeded by the same number of hens anywhere around here; they average per day at the present time nearly twenty eggs, although two are setting. A change of food for hens is the best way to make them lay; what I mean by that is, to feed them all kinds of grain, (except corn and rye), potatoes, and corn meal.—FRANK PADDOCK, Hamilton, N. Y.

Use of Hen Manure.

IN THE RURAL of March 26th is an article on the use of hen manure, in which the writer gives his method of applying that very valuable article to corn. Having had some experience in that line, and having, as I believe, found a better way than that recommended, I'm inclined to give my method to your readers. I mix plaster with the manure so as to give about one bushel of plaster to the acre. When I plant my corn I drop the composition in the hill, taking care to scatter it well, for too much of it, in immediate contact with the seed, will prevent germination. I have tried, using this article as a top dressing on corn, with very good results, but my experience leads me to prefer putting it in the hills—for, in the latter case, the whole strength is retained in the ground where it is within the reach of the young plant, whereas, when used as a top dressing, I think a considerable portion is lost by evaporation.—JOHN F. OVENSHIRE, Athens, Pa., 1859.

Remedy for Tumors or Wens.

EDS. RURAL:—Four years ago I had a cow that had a tumor come on the under side of the sub-maxillary, which grew to the size of a large goose egg. It was of an oblong shape, and lay parallel with the jaw-bone. It did not appear to be attached to the bone, but from what I could learn I came to the conclusion that it was a wen. It soon broke and became a running sore. In the spring I had it cut out by a neighbor who performed the operation rather unskillfully. It healed up, but broke again in the fall, and I then effected a permanent cure by rubbing it with linseed oil.

I now have a cow coming four this spring (the old cow's calf) that had two similar tumors—one on the side of her face just under the ear, and the other on the under side of the sub-maxillary.—(Query—are they hereditary?) Treatment.—Rubbed them every other day with linseed oil, with but little perceptible effect until they broke, when the fleshy part of the tumor protruded through the orifice. I then put on pulverized blue vitriol twice or three times a week, and cleansed occasionally with soap suds. This treatment was continued until the whole tumor disappeared and the flesh healed over perfectly sound to all appearance. This I think preferable to cutting out. D. B. P. Oakfield, Kent Co., Mich., 1859.

Rural Spirit of the Press.

Peruvian Guano.

A COMMISSION sent by the Peruvian government to survey the Chincha islands, with the view to ascertain the quantity of guano deposited there, report over eleven million tons. This, if correct, would, at the present rate of export of about 800,000 tons annually, afford a supply for only about thirty-six or thirty-seven years.

How to Keep Horses Feet in Order.

MILKS says:—"If I were asked to account for my horses' legs and feet being in better order than those of my neighbors, I should attribute it to the four following circumstances:—1st. That they are all shod with few nails, so placed in the shoe as to permit the foot to expand every time they move. 2d. That they all live in boxes instead of stalls, and can move whenever they please. 3d. That they have two hours' daily walking exercise when they are not at work. 4th. That I have not a head-stall or rack-chain in my stable. These four circumstances comprehend the whole mystery of keeping horses' legs fine, and their feet in sound working condition up to a good old age."

Renewing Hide-Bound Turf.

THE editor of the *Homestead* says:—"A cheap way to renew the turf upon land which has become 'hide-bound,' consists in scarifying the surface in the spring as the frost is coming out, with a fine-toothed harrow, or with a heavy stone boat, full of iron pins, driven about three inches through the bottom. A good coating of seed and a dressing of manure being thus applied, the turf is revived without the loss of a single crop. This cannot be practiced where the land is stony or rough, but upon old smooth meadows, which are becoming mossy, it answers a good purpose." Dragging an old meadow with a heavy harrow, then spreading on a little well rotted manure, afterwards passing over it with a brush drag, produces a wonderful effect.

Deep Plowing of Prairie Sod.

FARMERS from the East are surprised to find, on visiting the Western Prairie country, that the custom is to plow the sod only about two or three inches deep, in fact as shallow as possible, and the corn is planted in the thickly matted roots, with hardly soil enough to cover them. The first impression is that this practice is the result of necessity—the stiffness of the prairie sod, and the great amount of power required to plow even to this depth. This, however, is not the case, but the idea is quite general, and has been almost universal, that the turf will not rot as well if plowed deeper. The *Missouri Democrat* says recent experiments in deep plowing with the Michigan double plow, has begun to create doubts as to the correctness of this idea, and the *Prairie Farmer* says, "Mr. VAN DORN, of LaSalle Co., Illinois, says he gets more corn from one acre of sod planted in deep plowing, than on four acres as ordinarily plowed."

The Best Potato.

JOHN A. ROBINSON, of Belcher, Washington Co., N. Y., writes to the *Country Gentleman* that "the *White Peach Blaw* justly ranks among the best. Originating in the adjoining county of Saratoga, it has worked its way by its own merits into probably every State in the Union. Its habit of growth is peculiar. In its first stages of growth it presents a slender and sickly appearance, but later in the season it would 'astonish the natives' to see its strong and splendid growth. Succeeding well in all situations, it is found nearest perfection on strong and warm corn and oat land, stable manured the year previous. Its cooking qualities need no comment. The *Davis Seedling* was brought from eastern Massachusetts, and has more than realized the expectation of its friends. Extremely hardy and prolific, as a field crop it may safely be pronounced 'excellent.' Under very favorable circumstances it will yield from 800 to 500 bushels of potatoes, of uniform size, per acre. Owing to the vine being short and stocky, and the compactness of tubers in the hill, they will bear closer planting than the *Peach Blaw*. They appear to succeed best on rich sward land, and ripen moderately early. For the table, it has few rivals, and no superiors."

Liquid Manure Tanks.

JULIUS IVES, of West Meriden, Conn., in the *Homestead* of the 10th ult., gives the following cheap mode of adding to the fertility of the soil:—"I have become so much interested in the various ways of making manures, that I wish to call the attention of your readers to one way, which I apprehend but few have adopted, viz:—The building of cisterns for the saving of the soap-suds and chamber-slops of the family. Two years ago I purchased a small farm and took possession of it, for the improvement of my health. I purchased two horses, two cows and a few pigs. Being conscious that with such a small stock, I should greatly need more manure, I took, therefore, as my motto, 'Gather up the fragments that nothing be lost.' About the first thing, I built me a cistern that will hold from twenty to thirty barrels, by digging a hole, and cementing into the earth; (it should have been bricked or stoned, and then cemented.) I then went to the lumber yard for lumber, consisting of four pieces 6 by 6, which I framed together and placed around the outer edge. This frame was about eight feet square. Six joists 2 by 6, I then cut in, placing the two middle ones so near together as to admit of a hopper, which I made, placing about eighteen inches high, with a cover hung on hinges. I then nailed my floor boards to the joists only, leaving them to project two inches on the ends over the frame, making a place for a firm hold of the hands, so that three or four men can at once detach the floor and joists from the main frame and carry it off. And now, sir, this concern cost me less than five dollars, having done the work myself, and will, without doubt, pay me the interest of two hundred dollars. I should not be willing to sell for twelve dollars a year what I make from it. I draw it out every two months, and directly put in two loads of muck, making twelve loads of muck a year well saturated, and it would not be necessary for your olfactory senses to come in very close proximity to satisfy you that the muck had been drenched in something besides rain-water."

Agricultural Miscellany.

THE WEATHER has continued unfavorable during the week past—generally cold and wet, and decidedly unpropitious for farmers. As we write (Tuesday, 13th) the prospect is more encouraging, the temperature having moderated, and the sun exhibited itself to an extent and admiring world. We trust the long-looked-for Spring weather has come at last, and will not depart.

THE MICHIGAN STATE FAIR is to be held Oct. 2d to 5th inclusive—place not yet designated, but it is supposed Detroit will be the location. The competition for stock premiums is open to the world.

THE N. H. JOURNAL of AGRICULTURE is well-conducted, sly and sensible, and evidently waking up the farmers of the "Granite State." May its prosperity correspond with its pluck and good promise—and it will if the people of the State do their duty.

HUNGARIAN GRASS SEED.—J. W. C., of Sodas, and others in Western New York who wish to procure this seed, are referred to the advertisement of R. L. HOWARD, of Buffalo.—Read all RURAL advertisements, and you will often save time and expense of making inquiries.

DR. EDEN WRIGHT, of Dedham, Mass., is entitled to and will please accept our acknowledgments for various favors which have proved of value—including several fine engravings of fowls, (such as those given on that page.) pamphlets on Agricultural and Horticultural topics, &c.

SECRETARIES of AG. SOCIETIES.—State, District, County and Town—will confer a favor, and perhaps benefit their respective associations, by advising us as early as convenient in regard to times and places of holding Fairs for 1859, and also sending copies of premium lists, committees, &c., when issued.

THE "ADVISORY BOARD of AGRICULTURE" is ably defended in preceding columns, by our esteemed friend and correspondent, LINUS CORN, Esq., of Michigan. As we have "had our say" on the subject, we invite a perusal of Mr. C.'s article—simply remarking that, tho' seriously written, its sarcastic import cannot be mistaken Vice la Patent-Office and the "Advisory Board."

THE MARKET FAIR held at North Bloomfield on the 6th inst., was largely attended and quite satisfactory, considering the unfavorable weather. So we learn incidentally from a gentleman who attended, but have no definite report. We should like to receive official reports of the results of this and similar Fairs held the present Spring, in order to judge of their usefulness.

OUR DOMESTIC ECONOMY DEPARTMENT, though omitted one or two weeks recently for want of space, will be continued as regularly as possible. Those housewives who have written us on the subject, regretting the omission, are assured that we also consider it an important and almost indispensable Department, and that, with their aid, we shall endeavor to render it more interesting and valuable than heretofore.

THE PLANTER and MECHANIC.—This monthly Journal, heretofore commended in the RURAL, comes to us of late much improved in both appearance and contents. It is now one of the most beautiful of our exchanges, conducted with decided ability, and merits increased support. It is devoted to Agriculture, Horticulture and the Mechanic Arts, and though designed for Mississippi and Louisiana, may be read with profit by the planter, horticulturist and mechanic of other regions. Edited by J. J. WILLIAMS, Dr. M. W. PHILLIPS and Dr. H. A. SWAZER—and published by Col. J. J. WILLIAMS, Jackson, Miss., at \$1 per annum.

"THE YOUNG FARMER'S MANUAL" is the title of a work nearly completed, and soon to be published, by B. EDWARDS TODD, an occasional correspondent of the RURAL. The object of the work, as we are advised, is "to instruct young farmers how to perform their labor in the most skillful, easy and workmanlike manner." Mr. T. is a practical farmer and mechanic (in wood and iron) of considerable experience, and proposes to furnish a book entirely different from any yet published—one from which farmers can learn how to handle almost any tool with skill. He designs to illustrate the work, and requests us to announce that illustrations and descriptions of improved styles of farm fence, gates, farming tools and implements, augers, bits, &c., furnished by inventors, will, if thought meritorious, be given in the Manual. Mr. T.'s address is Lake Ridge, Tompkins Co., N. Y.

RUNNING WATER.—A Good Idea.—MR. C. E. FARR, of Natick, Mass., gives a bit of experience in the New England Farmer which may prove valuable to those of our readers whose premises are favorably situated for adopting his plan of obtaining running water for stock, &c. He says:—"Many are the farms that are not supplied with running water. Such was mine ten years ago. Thinking that by means of a siphon I might save the expense of pumping for my stock of cattle, I dug a well twenty rods above my barn, and twenty feet deep, the bottom of the well being on a level with the trough at the barn. The pipe was half inch, laid four feet from the top of the well, and run to the bottom; the remainder of the pipe laid so as to be secure from frost. These ten years it has worked admirably; as good to-day as ever. The cost of it was about fifty dollars. Now there are a multitude of places as well situated to obtain water by this means as my own, which, when obtained, the owners would not part with for many times the cost."

CATTLE BREEDERS' ASSOCIATION.—In accordance with a call recently issued, and noticed in the RURAL, a Convention of Cattle Breeders was held at Hartford, Ct., on the 5th inst. The Convention consisted of 48 members only, of whom all were from Connecticut, except eleven from Massachusetts, one from New York, and one from Vermont. After organizing temporarily and transacting some business, a constitution for a permanent organization under the title of "The Association of Breeders of Thorough-bred Neat Stock" was submitted, very generally signed by members, and the following officers elected:—President—JOHN T. NORTON, Farmington, Ct. Vice-Presidents—PAUL LATHROP, So. Hadley, Mass. (Short-horns); LEMUEL HURLBURT, Winchester Centre, Ct. (Devons); JOHN BROOKS, Jr., Princeton, Mass. (Ayrshires); THOS. MOLLEY, Jr., Jamaica Plains, Mass. (Alderneys); AMBROSE BOWEN, Medina, N. Y. (Dorsets). Secretary and Treasurer—HENRY A. DYER, Hartford. The permanent organization being completed, reports were made by committees, some discussion had, and various resolutions adopted—but we find little of general interest in the proceedings. A Committee on Pedigrees was appointed, and directed to present a scale of points for each of the several classes of thorough-bred neat stock. Among other things it was resolved "that we deem no animal to be thorough-bred, that cannot be traced by record in direct line, on the side of both sire and dam, to animals in Great Britain of undoubted purity of blood." The Association also resolved to "discontinue the practice of fattening breeding animals for the purpose of exhibition," and that "it is inexpedient for Agricultural Societies to offer premiums for Grade bulls." The next annual meeting of the Association is to be held at Springfield, Mass., on the first Wednesday in March, 1860.

HORTICULTURAL

HUMANIZING EFFECTS OF HORTICULTURE.

Some one has said "Murderers do not ordinarily wear roses in their button holes. Villains seldom train vines over cottage doors." The reforming influence of Horticulture is but little appreciated even by the wisest and best. The people will have amusement, and in what can they engage more innocent, more elevating, than in the cultivation of choice fruits and flowers. It has saved thousands in Europe from dissipation. When, as in various parts of England, the working people make a hobby of a fruit or flower, as the Carnation, the Tulip or the Gooseberry, they have but little time and little disposition to visit the ale house. Our nurserymen, in their catalogues, advertise "the best Lancashire varieties of Gooseberries." Not one in a hundred, perhaps, is acquainted with the fact that these fine varieties are grown from seed by the Lancashire weavers, men who labor ten or twelve hours a day, and make the growing of gooseberries and the raising of new sorts a special hobby, to which they devote every leisure moment. In some districts the Carnation is the favorite, and in every cottage garden will be found most beautiful specimens tended with the greatest care, and happy as a king is he who carries off the prizes at the shows, which are held very frequently during the flowering season. The *Balsam*, the *Cockcomb*, the *Ten-Week-Stock*, or the *Aster*, are the especial favorites of others. Often the workmen of a particular shop or factory, make a specialty of a particular flower, contribute a small sum each to be offered as a prize for the best specimen shown during the season, and zealously contend for the prize.

Cannot some such system be inaugurated in this country? Can our young men in cities derive pleasure only from drinking, smoking and driving fast horses? Must our young women seek enjoyment only in balls, parties, gay dresses and rides? Have the flowers no charms for the fair daughters of America? The time is not far distant, we hope, when we may be able to say in the words of SHIPLEY,

The flowers of that garden sweet
Rejoice in the sound of her gentle feet;
Doubtless they felt the spirit that came
From her glowing fingers through all their frame.

She sprinkled bright water from the stream,
On those that were faint with the sunny beam;
Or out of the cups of the heavy flowers
She emptied the drops of the summer showers.

She lifted their heads with her tender hands,
Supported their stems with ocher bands;
And if they had been her own infant, she
Could never have nursed them more tenderly.

Philanthropists are beginning to appreciate the reforming influence of gardening. At a late meeting of the British Association for the Advancement of Science, the Bishop of Ripon said, that "the Parish of Skipton, in Yorkshire, England, was inhabited principally by a rude, unrefined, and, to a considerable extent, immoral population, when the Rev. Mr. Boyd was appointed its rector. The first step he took towards their amelioration and improvement was to lay out and plant a beautiful flower-garden attached to the Rectory, to which he gave free access to his parishioners at all times. He afterwards encouraged some of them to ornament the gardens attached to their cottages by giving them plants and seeds; and in the course of a very few years, this rude population was, by the kindly influence of horticulture and floriculture, transformed into a most orderly, gentle and refined community."

We have not read a more interesting article for a long time than the following, which we cut from the *London Cottage Gardener*. The author is JOHN HAOUZ, a young man reared in the midst of poverty and vice, and wonderfully saved. He tells his own story in a simple way, and we commend it to the careful attention of every lover of his fellow man. It may be necessary to explain that the *work-house* is the English poor-house, and a *cadger* is one who goes around the streets picking up bones, old rags, paper, &c.

"I am not about to praise myself, but simply to tell a round, unvarnished tale of what botany has done for me and others. I have nothing to boast of, for I doubt not but I should have been in some convict establishment before now, if Flora had not stepped in to rescue me from amidst crime and ignorance. When eight years old, I was in the workhouse; from nine to about thirteen, I lived among cadgers, thieves and prostitutes, and learned not a few of their pranks. I was early placed in a cotton mill, but my leisure hours were spent in the above unclean company. The fair goddess appeared to me for the first time in the shape of an old Culpeper's "Herbal," which had been lent to my brother. We were so taken up with the plates, that we resolved to go into the fields to see if we could not find some of the plants pictured in the above book. We succeeded in discovering some, which made us anxious to find more, until we were fairly in love with the pastime.

I had learned to read in the workhouse school; so, after I became acquainted with "Culpeper," I spent the winter nights in rambling about shops seeking books with plants in. The next book I saw happened to be the right one: it was "Conversations on Botany." I inquired the price, and paid a shilling on it that I had saved, till my brother and myself got the requisite sum. Having procured the work, it found us little worshippers, and gave us little opportunity for mixing amongst our poor benighted neighbors. The first year we knew the Linnaean system of arranging plants, or rather the classification. In my sixteenth year, I entered one of the local botanical societies, which are pretty numerous in this part of the country. I was made Vice-President, which post I held until I went to learn gardening.

At the numerous botanical meetings in Lancashire, all sorts of men are generally in attendance,—the steady and otherwise, the ignorant and the informed; and though the meetings are mostly held at public-houses, they are, nevertheless, agents of civilization. While attending the above meetings, I became acquainted with two persons, one of whom could not read and was a collier, the other a sawyer, and both were drunk characters. The first time they came to the meetings

out of curiosity, and then became regular attendants. I was chosen by them as a teacher. After teaching my pupils for about a year, I called upon one of them. He was upstairs dressing. His wife thanked me for keeping her husband from the alehouse, excepting on meeting nights. She said he never had been so kind to her since their marriage, as he had been since he began to botanize. The collier coupled entomology with his botany, and has made good collections of insects—in fact, he may be said to be a walking catalogue. The two have had no time for drunkenness since they began riding their hobbles.

The working men of Lancashire who pursue botany, or any of the other sciences, are a quiet, unassuming class of persons. Great numbers of them can tell the name, class, and order of almost any plant in a day's walk, although their occupations are not with plants. Being once in conversation upon the benefits to be derived from botany, an old clogger who attended the meetings said he had followed botany for fifty years, but did not remember that he ever received a penny on account of the science, yet money could never buy the happiness he had had during his life from botany. A powerloom weaver, who had a good knowledge of mathematics, taught me arithmetic, and I taught him something of my favorite science."

CULTURE OF THE GRAPE.—No. VI.

Messrs. Editors:—What kind of culture is best for Grape Vines? That which is best for grain crops, and is sometimes called *high farming*. Nothing pays better for such treatment than the vine. For a vineyard let the land be well drained; then plow one foot or more deep, and make the soil rich that depth; then subsoil twenty or more inches deep. I think it safest and best to take up and set vines in the spring. Two-year old vines are the best age; set from twelve to sixteen feet apart. Plant the land to corn or potatoes, the vines occupying the place for a hill of corn or potatoes. Give them clean culture. For the second crop I prefer beans, as they shade the vines less and leave the ground smooth when the crop is taken off. The next spring build trellises, and leave the ground bare on each side of them, to train the vines. A few rows of beans may be planted between the trellises. The next or fourth season the vines begin to bear fruit, and should have the principal benefit of the soil. Let the surface be left smooth this year. After this year give the vines the whole of the benefit of the soil, and then commence mulching for culture, by hauling forest-leaves or straw, and spreading straw over them to hold them from being blown away by heavy winds when dry. Spread manure of all kinds over them, leached and unleached ashes, rich muck or mold. This for culture keeps the ground rich and moist through July and August, when the fruit needs a full supply of sap.

With the arrangement I have given for trellises, the team can pass through all parts of the vineyard at any season of the year. The fruit on an acre of vineyard kept clean from weeds and grass by mulching, will be found worth more than that of two acres kept clean by the plow and hoe. The roots of the vine strike near the surface, and the soil under my old ones, where the roots extend, cannot be stirred more than two inches deep without injuring the roots.

To preserve the fruit the greatest length of time in a fresh state. The experience and practices of the best vine dressers have been made public, yet a few thoughts on this subject may add to the stock of information. It is generally understood that grapes stored away in boxes must have something with them that is dry to absorb the moisture that is passing from them, or it gathers on the skin of the grapes and causes them to rot, unless the boxes are small and shallow so that the air can carry off the moisture; in that case the fruit dries away too quick for long keeping. Profiting by the idea lately obtained, that fruit put into cans and sealed up from the air is kept a great length of time in its native freshness, the thought suggests itself to me that to get good tight barrels, then pass clean straw through a straw-cutter; pick the grapes from the vines on a dry day and immediately pack them away, giving a layer of straw then a layer of grapes the clusters not so close as to crowd each other, would be the best way to keep them. Put a bushel in a barrel—perhaps experience would teach a bushel and a half would be as safe—head them up tight, set them in a cool place, and move them to the cellar before frost. My experience goes to favor the idea that grapes thus put away can be taken out fresh and sound long after the birds come to sing the songs of spring so merrily.

I close these articles by condensing a few leading ideas that should be remembered in caring for the vine. First, In pruning vines before they begin to bear, let the laterals get about a foot in length before they are taken off, as too close pruning will start the next year's fruit buds and injure the crop of fruit. Second, When vines are loaded with fruit, remove the laterals as soon as they begin to start. The fruit needs the sap they will exhaust. Third, As soon as the blossoms begin to appear, use the knife freely. The sap then will not leak. Fourth, To have fruit set thick on the clusters prune thoroughly when the blossoms begin to appear. I have counted over eighty Isabella grapes on a single cluster. Fifth, To have fruit of large size and thinner on the clusters, about half prune when the blossoms begin to appear. In a week or ten days prune thoroughly. Sixth, Fruit that has a crowded supply of sap from the time it begins to form until it is ripe, will be a fortnight earlier in ripening than that which is started by either too much young wood growing on the vines, or being too heavily loaded with fruit. Seventh, Vines should never be loaded so heavy with fruit as to have many green berries on the clusters when the crop is gathered. Eighth, That man will be the most successful vine-dresser who can judge the most correctly, when he sees a vine, how many pounds of grapes it can bear, and get that fruit on the least number of clusters.

I have learned much about the vine by studying carefully what the Saviors says about the vineyard, the vine, and the connection the branches have to the vine and fruit bearing. When the Saviors said the householder went out early in the morning to hire laborers into the vineyard, then the third hour, the sixth, the ninth, and the eleventh hour, during all he could, it shows conclusively, that there is much labor there. When I see the rich clusters of fruit hang so thickly from the branches and

study the connection they have to the vine to thus produce so bountifully, I am led to say what figure could He have given to set forth so forcibly to the mind the great truths He taught. Messrs. Editors and Readers, adieu for the present. On these subjects, vine-dressers, let us also have your experience.

Almost daily people are asking me for information on *Vine Culture*. I ask them if they take the *RURAL*; if not, I urge it upon them, saying, they will get more worth in it on Grape Culture than the volume costs. ALVIN WILCOX.
West Bloomfield, Ont. Co., N. Y., 1859.

GOLDEN HAMBURGH GRAPE.

In the *RURAL* for the first of May, 1858, we noticed several new varieties of foreign grapes, raised in England, and among others, one called the *Stockwood Golden Hamburg*, said by good judges, to be the best white grape known, and to it was awarded by the Pomological Society, in 1857, the first prize as the best Seedling White Grape. It was raised from the *Black Hamburg*, impregnated with the pollen of the *White Sweet Water*. To-day (April 11th,) we have been favored with the opportunity of seeing this vine in fruit, and tasting its luscious berries, at the grape-house of C. P. Bissell & Salter, who, so far as we can learn, have been the first to fruit it in this country.

The growth of the vine bears a stronger resemblance to the male parent than to the *Hamburg*, being short-jointed in the wood; but the foliage is more similar to that of the *Hamburg*, being large, five-lobed, and the veins and footstalks tinged with red. The bunches are large, loose, branching, and shouldered, varying from 6 to 9 inches in length, and the footstalks are short and stout. The berries are large, and hang loosely on the bunches, an inch long, and seven-eighths of an inch wide, and of a uniform oval shape. The berry-stalks are rather long, stout, and considerably warted, as will be seen by the engraving. Skin, thin and tender, of a pale, greenish-yellow color, somewhat marked with veins, like a *Whitesmith* gooseberry, but, when highly ripened, of a pale amber. Flesh delicate and melting, very juicy, and remarkably rich, sugary, and vinous, leaving on the palate a full and luscious flavor. Each berry contains from two to three seeds. The plant is small, grown in a tub, and does not show the fruit in perfection, as we shall expect to see it another season.

CIRCULATION OF THE SAP.

Messrs. Editors:—In the *RURAL* of March 19th, you gave an article upon the "Circulation of Sap," by LEVI BARTLETT; and I would like, with your permission, to offer a few remarks upon the same subject. I do not know as I shall differ very materially, from him, in his description of the course of the sap, or the growth of the plant; but I cannot agree with him in the cause which he seems to assign for the ascent of the sap.

If I understand him, he means to say that the circulation of the sap is caused by the simple action of gravity; in other words, that the water in the ground rises into the tree merely because the sap above it has a greater specific gravity. At least he gives no other reason and the experiment which he mentions, with his interpretation, proves nothing else, although he does not state his conclusion in the same words that I have used. Now, if nothing but gravity is concerned, why does the sap start up at all? Doubtless he would say, that the sap in the tree, and the water in the soil, being of a different specific gravity, the latter rises through the membranous covering of the roots, according to what is termed endosmosis, while the former descends; but then, obviously, they must pass each other where the motion of the water commences, at the ends of the roots; and, consequently, the sap, which had been prepared in the leaf to nourish the plant, would be poured out again into the soil. I should be unwilling to admit that an All-Wise Power would place at the bottom of the tree an apparatus that would pour out sap, which had gone through a long process of preparation for a particular purpose, just as it was ready to fulfil that purpose, in order to force into the tree a quantity of clear water, which must be greatly modified before it could serve to nourish the plant.

But perhaps Mr. BARTLETT will rely upon his experiment to support his position, and say that the principal motion through the membrane is always from the lightest to the heaviest fluid, (this would not be true in the case of water and alcohol,) and for the same reason the water in the soil passes through the membrane which covers the roots, and forces the heavier sap up the tree; but still endosmosis would take place, or some of the nutritious sap would pass out into the soil. And, even if it be true, that this action depends upon a difference in density, it is certainly very mysterious; for how can a liquid force its way through a membrane against the greater pressure of a heavier liquid? But, in my opinion, his explanation of the experiment is entirely incorrect. The motion is not, in the least degree, caused by the difference in the specific gravity of the liquids. "The relation of specific gravity has nothing whatever to do with

the action."—(DRAPE.) Mr. B. could easily prove this, by placing alcohol, which is lighter than water, in the cupping glass, instead of the sweetened water, and he would find that the motion would be in the same direction as before; thus showing that a change in the specific gravity of one of the liquids does not alter the result in the slightest degree.

The motion of the liquid depends upon an entirely different principle, as does also the circulation of the sap. This principle is capillary attraction. If one end of a small glass tube be immersed in water the water will rise in the tube to a certain height, and remain suspended. If a piece of sponge or sugar, or any other porous substance, be brought in contact with water at one extremity, the water will immediately rise, and wet the whole substance. These are examples of capillary attraction; and the cause of the ascent of the water, is the attraction of the substance of the tube for the water, which seems to overcome the cohesion of the aqueous particles. If we take a tube of such a size that it could raise water to a certain height, say ten inches, and break it off to six inches in length, there would be no overflow; but if the water at the top of the tube should be removed in any way, as by evaporation, a continuous current would be produced. As an example of such a current in capillary tubes, I might mention the upward flow of oil or fluid in the wick of a lamp after it is lighted.

Again: if we bring two liquids into contact in a capillary tube by the substance of which they are unequally attracted, having each end of the tube in communication with a supply of its respective liquid, motion will be produced, the liquid most strongly attracted driving the other before it, and perhaps expelling it from the tube entirely, without any regard to its relative specific gravity. Now, by applying these principles, we have the correct explanation of Durnocut's *Endosmosis* experiment described by Mr. BARTLETT; and I think, also, of the ascent of the sap in plants.

The tree is but a great bundle of capillary tubes, and these elevate the sap from the ends of the roots to the highest leaf or flower, by the operation of these principles of capillary attraction, modified, perhaps, to a certain extent, by peculiar changes in the chemical affinities of the sap in its upward progress; and, from the leaf, a large portion of the sap is evaporated; and thus the necessary conditions of a continuous current are established.

The downward flow of the sap, which distributes it to the surface of the tree, is only a part of the circuit, caused by the upward motion. After the sap is changed in the leaf, it has no longer any affinity for the substance of the leaf, and is forced out of it by the upward current; and, passing through the pores of the *lenticiferous tissue*, found, principally, in the inner bark and the under side of the leaf, it finds its way to every part of the surface of the tree, where it forms new wood.

I am aware that Mr. BARTLETT's explanation is given by some good Botanists, but I cannot adopt it as long as we have another which is supported by even better authority, and seems to me far more reasonable.

The force with which sap ascends, has been estimated at thirteen pounds to a square inch; and, of motions, caused by capillary attraction, DRAPE says, "I have observed these motions occurring against a pressure of many atmospheres."

H. H. BARRETT.
North Lawrence, N. Y., March, 1859.

WESTERN N. Y. FRUIT GROWERS' SOCIETY.

Mrs. Editor:—I have been a regular attendant on the meetings of the "W. N. Y. Fruit Growers Society," since its commencement, with great satisfactions and edification. The discussions are always so practical, and the results of actual experience, that they cannot fail of exercising a beneficial effect on the great fruit growing interests of this country.

The winter meeting happening in January during the shortest days, allow but a brief period for discussing subjects, where there is much diversity of opinion, and, for the want of method and proper regulations, a great deal of time is wasted. But the greatest error in the arrangements in my estimation is, the want of previous and early information to the members of the subjects to be discussed. By about two o'clock on the first day, the subjects for agitation are laid before the meeting, no one is prepared, or has thoughtfully bro't his mind to the particular subject, and the discussions become a disjointed tea-party chit-chat in many cases; whereas, if they were given out a month or two before the meeting, those posted on the different subjects would digest and organize their ideas to great advantage; particularly those who have not the gift of gab, and not in the habit of public speaking.

There should be a rule that no one should speak longer than 15 minutes on any subject, and only once, except to give explanations to questions asked, or by a suspension of the rule.

I think this Society, under judicious management, is bound to do more good and diffuse a greater amount of important information than any other process that has yet been subjected to trial—in the settling the proper names and value of the great varieties of fruits—the manner of propagating, pruning, planting, and preserving—the habits and hardiness of trees and their diseases, and the insects that prey upon them.

Orleans, N. Y., 1859. L. B. PATTISON.

TILES FOR GARDEN BORDER EDGING.—In the English Horticultural Journals, we notice that tiles of different patterns are advertised for garden border edging.—We give an engraving of one of the neatest from the *London Gardener's Chronicle*. It is furnished at 5d (about ten cents) a yard. This tile would be very useful here, and would be popular, no doubt, for we are impatient for immediate effect. Will not some of our brick or tile makers take the hint and put border tile of some neat pattern in the market? It could, we suppose, be made curved, so as to answer for circular beds or curved walks.

CHISWICK GARDEN.—The London Horticultural Society's Council have decided upon making the Chiswick Garden in future exclusively experimental. A circular letter has been addressed to the trade, inviting co-operation by the transmission for comparative trial of every kind of new or supposed new vegetable.

WASHING-DAY.

FRIEND *RURAL*:—In a late number we saw a few hints by a lady, some which were taken from Mrs. M. L. Scott's *Practical Housekeeper*, relative to washing-day and its evils, which our husband tho't we had better cut out and preserve, but instead, we would prefer to make a few remarks. Thus again, proving the old adage, that woman is always on the contrary side.

I do not wholly agree with said hints, especially for those who have the management of their own domestic affairs, in regard to dress, &c. I believe in dressing suitably to the work; not that I would advise negligence in our dress because we are washing, for we can have a wash dress, whole and clean, yet one we are not afraid of soiling. As for our house, we intend to have that put into the same order as for any other work, with the exception of cleaning before we commence our washing. If the appearance of the woman in her washing dress offends the fastidious eyes of the husband; if he has no business to call him out (which he certainly should have) he could walk into the parlor, if fortunate enough to have one; if not, he could go to bed and cover up head and ears to shut out all obnoxious sights. If he can not endure a part of the so-called ills of washing-day, when it is as much for his benefit as ours, and we have the largest portion of them to bear, it seems to me his room would be better than his company.

As for our being as liable to see company as on another day, we think not, if every one would act up to our rule, and wash on Mondays. But, if it so happens, which is necessarily the case sometimes, and they too cannot submit to the inconveniences attending washing-day, then they can also bear the husband company.

To men, who for want of system are driven from the domestic fireside, we would say look unto yourselves and see if there is not something you can do to alleviate this wrong. Are not the cares of your wife greater than she can bear? Are not her household duties, on account of their magnitude, a burden instead of a pleasure? Woman needs relaxation from the routine of every day life. She is your wife, and unless you attend to her wants and pleasures in some way that answers the expectations you raised before marriage, you need not wonder that she makes but an indifferent housekeeper—that she considers it heartless drudgery. There are a few, I admit, who are so constituted either from nature or education, that they love not order in anything.

Will not some of the lady readers of the *RURAL* please to send a few directions for cooking meals, as well as for pastry, and oblige
M. C.
Clarendon, N. Y., 1859.

ICE CREAM, AGAIN.

MESSRS. EDS.:—In reading the "Domestic Economy" portion of the *RURAL*, I find "E. Y. E." wishes a recipe for Ice Cream. My rule, which I have always found excellent, is this:—Take one quart of sweet milk and cream; 2 eggs; 1 teacupful of white sugar; 1 teaspoonful of flour stirred into 1/2 teacupful of sweet milk; flavor to your liking. Put your milk in the freezer, or if you have no freezer a 3 quart pail is as good, and set it into a kettle of boiling water, stirring the milk frequently, so that it will not burn. Beat the eggs, and when the milk boils stir them into the milk—take it out of the water, put in to the milk, the sugar, flour and flavoring. Put the ice into a bag and pound it into lumps the size of a hickory nut, put a layer of ice into a small tub, or whatever you wish to freeze it in, and a thin layer of salt, put your freezer or pail into the tub and then put a layer of ice and a layer of salt alternately around it. Stir the cream which will freeze, from the sides with a spoon; stir it frequently until it is frozen. If you make it as directed, you will not fail of having excellent ice cream.—FRANKY H—, Fayette, Seneca Co., N. Y., 1859.

EDS. *RURAL*:—In reply to the inquiry from a sister of Licking, Ohio, in the last *RURAL*, I will give the following as the best recipe I have ever tried:—Take one quart of sweet cream, make very sweet with best sugar, and flavored; whip it to a light froth; skim off as fast as it is beaten and put into your freezer, until all is whipped to a light froth. You will find it will freeze in less time than any other recipe. The above will make five quarts of delicious cream.

ANOTHER, VERY GOOD RECIPE.—Take 4 eggs, to 1 pint of milk; beat the yolks to a light froth, and put in the milk; sweeten very sweet. Put all in a tin pail, and set it in a kettle of boiling water, stirring all the time, till thick as cream; then stir in the whites, beaten to a froth. Then set the pail in cold water, stirring 'till cool,—adding Vanilla and a quart of sweet cream, (beaten to a froth.) Then put to freeze.—S. A. B., Rochester, N. Y., 1859.

FRUIT CAKE.—Two pounds of flour; 2 lbs. butter; 2 lbs. sugar, beaten to a cream; 12 eggs, the yolks beaten with the sugar, and the whites to a froth; 2 wine glasses of rose water or brandy, in which lemon rinds have been steeped; 2 nutmegs grated; 2 teaspoons of saleratus dissolved in warm water; 2 lbs. raisins, stoned and chopped. This cake will keep three months.

RICED PUDDING.—Two quarts of sweet milk; 1 teacup of rice; 1/2 teacup butter; 1/2 cup sugar; 1/2 nutmeg grated. Put the rice and other ingredients in the milk. Bake two hours.—Mrs. E. L. N., Elba, Genesee Co., N. Y., 1859.

A CURE FOR CHILBLAINS.—A correspondent of Springport, Mich., inquires what will cure chilblains. Put 1 ounce of litharge in 1 pint of strong vinegar; shake well, and bathe the affected part. This has cured several of my own family.—JAMES P. VINCENT, Waterford, Pa., April, 1859.

Written for Moore's Rural New-Yorker.
SILENTLY!

SILENTLY! silently! fold the hands
Over the pulseless breast,
Heath! not a tear or quivering sigh—
See! she has sunk to rest.
Gone in her beauty's bloom,
Gone from hearts that loved,
Gone to an early tomb,
Gone to a home above.
Gone from our tears and sighs
To a land where they're unknown,
Where praise from "ever-tuned" harps arise
To one on a "Great White Throne."
Then quietly fold the hands
Over her peaceful breast,
For he that watcheth o'er all earth's lands
Hath given His beloved rest.
Grand Rapids, Mich., 1889. Mrs. J. W. L.

Plain Talks to American Women.—No. 8.

BY MRS. M. P. A. CHAZKIN.

"NAY, speak now! a kindly word
Can never leave a sting behind.
But, O, to breathe each tale we've heard
Is far beneath a noble mind.
Full oft a better seed is sown
By choosing thus the kinder plan;
Then if but little good be known,
Let's speak of all the best we can!"

There is another way in which parents sometimes, unconsciously, perhaps, exert a pernicious influence upon the minds of their children, viz.: by freely conversing in their presence of the faults, imaginary or real, of their neighbors and others with whom they may be associated. By how many, even among professors of religion, is this precept of the Bible, "Speak evil of no man," disregarded? Charity, the purest ray that ever penetrated thick clouds of selfishness that have settled upon the human heart, would seem scarcely to have reached their souls, and instead of a noble germination of generous emotions, blossoming out in kind deeds and kind words, there is, as it were, a damp, moldy growth of envy, jealousy, hatred, and unforgiveness. It would seem to be much more agreeable to some persons of this class to discern and remark upon a fault in the character of another than a good quality, and if both exist, while the latter is almost wholly overlooked, the former is magnified many fold.

By listening much to conversation conducted upon this principle, children readily imbibes the spirit, and learn to speak the language of detraction. And not only this, but their confidence in many of the really good and noble may be destroyed, and any salutary influence, which such persons might have exerted over them, be counteracted. Their confidence in the religion of Jesus, even, may be thus impaired, for by looking at the characters of its professors through the refracting medium of their own uncharitableness, and that of others, and observing only distorted objects, they will be liable to reason that a Christianity which, so far as they are able to perceive, produces only very imperfect results, has in it nothing of the divine. Truly, the tongue of the defamer has a deadly sting, and it is a sad thing when the children of a household all bear with them its poison.

Let us illustrate the subject a little. Mr. R. is a true man. He would scorn to do an ignoble act. He is conscientious and firm in his practical adherence to principle, striving by consistency of life to exhibit to the world the value of the truths he advocates. Chancing to be somewhat radical in his opinions upon certain subjects, his course of action, as harmonizing therewith, appears to some of his neighbors odd, and their minds having been accustomed to run in the channel of conservatism, and their actions to be governed by expediency, they are altogether unable correctly to account for it. Perhaps the offence against general opinion may lie in a hygienic direction. His medical and dietetic views may be at variance with popularity. To Mr. C., his nearest neighbor, are his views particularly obnoxious. Mr. C. is a man of the world. His opinions and practices are governed, to a great extent, by his opinions and practices. What has from time immemorial been believed by the world, possesses with him the authority of an oracle, and if this, as is most likely, coincides with his personal habits, he seeks no farther for a rule of action. He even shuns investigation, from the fear that he may be obliged to admit as true something that will conflict with his prejudices. In short, Mr. C., although as loud in condemnation of bigotry as any one, is himself a bigot. He has a large family growing up around him. In a general way he desires that they may become enlightened, honest, upright men and women. But is his own example such as will influence them to become so? Does he in his daily conversation cultivate within them that independence and liberality of thought, does he impress upon their minds the necessity of faithfulness to convictions of duty, which he should do, if he would have them the unflinching, unbending champions of truth and right, which the age demands. Let us see. He is seated with his family at the dinner table, and by a natural transfer of thought from his own table, laden with highly seasoned and concentrated viands, to the simply and healthfully furnished board of his neighbor, he is led to remarks like the following:

"I declare, this seems like a dinner! Why, yesterday at Mr. R.'s, they had nothing but brown bread, and Johnny cake and milk—not a bit of tea or coffee—and some vegetables and fruits, and such like—not half seasoned either! If I was as rich as Mr. R. I wouldn't starve myself and family to death for the sake of laying up a little more money!"

"But, Pa," interrupts a little son a dozen years old, "Mr. R. says it is much more healthful to live so, and that that is the reason of their doing it!"

"Pshaw! He needn't tell me any such stuff as that—he's stingy—that's all! Healthful! My grandfather lived to be most eighty years old, and he hadn't any of these 'new-fangled notions'; he drank tea three times a day—couldn't get along without his pork just as often—chewed and smoked two pounds of tobacco a week, and took his bitters as regularly as I do my pipe;—that shows me plainly enough what's healthy in the eating and drinking line! Then as to washing, I don't believe he ever took a full bath, as they call it, in all his life!"

"Well, Pa, maybe if he had lived right, he would have lived twenty years longer than he did, and been more healthy than he was!"

"If I can live to be eighty years old, it's all I'll ask! and as to being healthy, why, to be sure grandfather had the rheumatism sometimes, but that's nothing more than might be expected in an old man—he could do more work in one day than I can in two. How Mr. R. can stand it to cradle and mow on such living as he has, I'm sure I can't tell. I must have solid food, such as pork and beef, or I can't work hard two hours! Then just think, when Mr. R. gets sick—he does get sick sometimes—he never sends for a Doctor—too stingy to pay a Doctor's bill, I suppose!—he just splashes on a little cold water, at least he pretends he don't do anything else; I half doubt his word sometimes, for I don't believe water can cure a man so quick."

Now, what kind of an influence is this parent exerting in his family? He is judging of things of which he does not understand—slandering his noble-minded and conscientious neighbor—misrepresenting his theory, and all this in the presence of children who are ready to catch his own spirit, and be transformed into the likeness of his own little soul. No wonder there is such a narrow-mindedness in community, when parents thus cultivate it in their offspring! No matter if Mr. B.'s views are extreme; we have no right to treat any man's opinions in this way—have no right to defame his character because he happens to have struck out into a different path from the one in which we walk! We should cultivate in ourselves, and those under our charge, liberality of feeling, a willingness that all should enjoy the sacred right of thinking and acting for themselves. It is utterly at variance with the genius of our institutions, that we should prescribe and limit for another the bounds of his investigations and conclusions. It is at variance with the progressive spirit of our age that we should be content to believe what our fathers believed, and do as our fathers did, because they thus believed and acted. We should open our souls for all the light that may be poured out around us, believing that nothing is profitable for us, that "nothing is beautiful but truth." And this candor should we aim to beget in the minds of our children. A time is foretold in prophecy when "knowledge should be increased." We believe that time has come; but how little will it benefit us if we close our eyes, and shut our ears to the glory and the music of its coming.

Instances illustrative of this careless habit of detraction might be multiplied *ad libitum*. The mother, in the presence of her daughters, speaks almost as freely of the pride of Mrs. A., the deceitfulness of Mrs. B., and the selfishness of Mrs. C., as though she had been permitted to look into their hearts, and as she should do of her own faults in the presence of her God! She forgets that she is liable to misjudge of motives, and that she would feel much averse to having her own character thus analyzed, judged, and conversed upon by others. It should be the aim of the mother to cultivate in the minds of her children, the most kindly views of human nature consistent with truth. There may be instances where, in order to teach them to avoid error, and to secure them from temptation, it will be necessary to point out certain faults in certain individuals; but it should always be done judiciously—in such a manner that the object of doing so may be fully understood, and the lesson designed be impressed upon the heart. They should be taught the liability of all to do wrong, and be led to pity, and heartily desire the reformation of the erring one. No promptings of curiosity, envy, or jealousy, should be allowed to influence the mother to lower in the estimation of her children the character of a single individual, but that charity which "covers a multitude of sins," should be thrown as a mantle over all. Children are naturally trusting; let them trust, so far as they may without danger. If you observe in the young companion of your son a feeling of superiority, an aristocratic pride, do not hint the discovery to your child, lest you awaken in his heart a train of ungenerous emotions, and unholty passions, which years of experience and endeavor will scarcely suffice to eradicate. What matters it to your child, that another regards himself superior, so long as he is unconscious of it? Ignorance, in a case like this, is by far the greater bliss.

A FAITHFUL WIFE.—The Mareschal de Mouchy, having been conducted a prisoner to the Luxembourg, had scarcely arrived there when his wife entered the prison. The gaoler observed to her, that the order for the Mareschal's arrest made no mention of her. She answered with mingled gaiety and sweetness, "Since my husband is a prisoner, I am one also."

When he was carried before the Revolutionary Tribunal, he was still attended by his wife. The Public Accuser having informed Madame de Mouchy that she was not called upon to appear, she replied, "When my husband is called for, I am also called."

In a word, when the fatal sentence of death was pronounced upon the Mareschal, his faithful wife ascended the cart with him; and when the executioner objected because she was not condemned to die, she answered, "Since sentence is passed upon my husband, it is passed upon me also."

CULTIVATED WOMEN.—Sheridan said, beautifully, "Women govern us; let us render them perfect. The more they are enlightened, so much the more shall we be. On the cultivation of the mind of women depends the wisdom of men. It is by women that nature writes on the hearts of men."

True beauty is but virtue made visible in outward grace. Beauty and vice are disjoined by nature herself.

RICH, THOUGH POOR.

No rood of land in all the earth,
No ships upon the sea,
Nor treasures rare, nor gems, nor gold,
Do any keep for me:
As yesterday I wrought for bread,
So must I toil to-day:
Yet some are not so rich as I,
Nor I so poor as they.

On yonder tree the sunlight falls,
The robin's on the bough,
Still I can hear a merrier note
Than he is warbling now;
He's but an Arab of the sky,
And never lingers long:
But that o'erruns the living year
With music and with song.

Come, gather round me, little ones,
And as I sit me down
With shouts of laughter, on me place
A mimic regal crown:
Say, childless King, would I accept
Your armies and domain,
Or e'en your crown, and never feel
These tiny hands again?

There's more of honor in their touch,
And blessing unto me
Than kingdom unto kingdom joined,
Or navies on the sea:
So greater gifts to me are brought
Than Sheba's Queen did bring
To him who, at Jerusalem,
Was born to be a king.

Look at my crown, and then at yours:
Look in my heart, and thine:
How do our jewels now compare—
The earthly and divine?
Hold up your diamonds to the light,
Emerald and amethyst:
They're nothing to those love-lit eyes,
These lips so often kissed!

Oh! noblest Roman of them all,
That mother good and wise,
Who pointed to her little ones,
The jewels of her eyes,
Four sparkle in my own to-day,
Two deck a sinless brow;
How grow my riches at the thought
Of those in glory now!

And yet no rood of all the earth,
No ships upon the sea,
Nor treasures rare, nor gold, nor gems,
Are safely kept for me:
Yet I am rich—myself a King!
And here is my domain;
Which only God shall take away
To give me back again!

[Knickerbocker Magazine.]

Written for Moore's Rural New-Yorker.

UNCLE BILLY.

BY HATTIE HOPEFUL.

UNCLE BILLY was a son of one of the first settlers, in a pleasant, fertile, and healthful part of the State of New York. He had neither brothers nor sisters that attained the age of maturity, and at his parents' death was sole heir to their estate. Accustomed to out-door exercise in early life, he had acquired a robust, strong, muscular frame. Though possessor of much wealth he did not imbibe all the fashionable notions that many in his circumstances would have done. He had plain common sense, common education, and thought his own opinion worth as much as any man's, on subjects which he understood; and many people gave him the credit of having intuitive knowledge.

His style of expression on various subjects was peculiar to himself. He did not fear to be called singular. Odd, to him, had a different significance than what many attribute to the word; for he knew that a thinking, or original mind must necessarily differ in opinion from the general, or unthinking masses. It must deviate from the beaten track, and find a path for itself. This has been the case with all who merit the greatest honors for the many improvements of railway, steam-power, telegraphing, &c.

A thoughtful and conscientious mind must be singular, and must act from a sense of individual responsibility. So Uncle BILLY thought, and so he acted. "Kind, generous, and noble-hearted man," said the District School Teacher, whom he always welcomed to his home. "God bless him," said the poor widow, when he sent her a quarter of beef, some grain and wood. "Good man," said his neighbors—"we can well afford to call him Uncle BILLY, since he is always trying to aid us by giving us some profitable advice, whereby we may better our circumstances, and be more comfortable in health or home."

Plain food, said Uncle BILLY, is a better guaranty to health than all the skill of the doctors. Out-door exercise a better stimulant than tea, coffee, or cider, and he who drinks neither of these is not apt to drink any thing stronger. Puffing cigars, and spitting tobacco juice, he utterly abhorred, and openly avowed his detestation of these things. Though he abhorred these habits in any one, he did not turn aside from others, saying "come not near me, I am holier than thou;" for he believed man was born for society—that in society he should mingle, and exert his holy influence for good; if stronger in faith, virtue, knowledge, prudence, and temperance, he should exert his influence in trying to establish these graces in others.

Thus Uncle BILLY reasoned, and thus he acted; for he did not fear to do what his own conscience told him was right, lest some one else might think differently, and he might incur the risk of some thoughtless remarks. To do good to others was a principle with him; but he did not think that the only, or best way of doing good was always by giving property. Kind looks and words to the dejected—seasonable advice to the wavering—employment to the unemployed—instruction to the ignorant, were esteemed by him to be often as benevolent offerings as property.

When he saw a man indulging in any injurious habit, he kindly reasoned with him, asking him why he chose to do thus?—what benefit he derived therefrom?—what benefit he conferred upon others?—if the time and money expended in this way would not do himself and others more good in some better way, &c. In this manner he often succeeded in awakening thought in the minds of many whom he met, the result of which time will tell. When he heard a man swearing he felt sure that he had some other habit that paralyzed his moral sense—rendering him excitable, and unthinking—such as eating gross and unhealthful food, drinking unhealthful beverages, chewing or smoking tobacco, &c.

When the cold, wintry winds, and driving snow whistled around his dwelling, he thanked God for his comfortable mansion, warm fire, and abundant supply of food, and sat down to meditate on the condition of those around him. His nearest neighbors were men of wealth, who had lived on their fertile farms, in their peaceful homes, for many a year, and had no mercenary wants that they were not able to supply. As Uncle BILLY thought of the peaceful condition of these neighbors—their abundant supply of the necessities of life—their temperate, industrious, and prudent habits—their attachment to their homes—their steady, persevering toil to secure and improve them, he exclaimed, "Health, temperance, industry, perseverance, and prudence, might secure homes to the homeless, almost any where in this fertile and free land, if they would but exercise these graces; but these graces are not exhibited to them in the light their importance demands. The fashionable way of expending ones earnings for things that do no good, but much injury, destroying health and happiness, ought to be discarded by every one. A home is one of the greatest essentials of mortal existence, to secure which should be a paramount consideration with every one. A neat little house, a nice garden, and a few fruit trees confer many blessings on any family, and a permanent abode secures from many losses and anxieties of mind that most otherwise be felt. It is much better to be contented with so small a home, than to have none at all. Almost every family expends enough for unnecessary and fanciful things in a year or two, to secure these, or a foundation for these at least."

After meditating on these things, Uncle BILLY took his Bible to read a few chapters, as was often his custom; and his eye fell upon these words:—"The poor, ye have always with you, and whenever ye will, ye may do them good." "True, said he, and I will go to-morrow and carry some supplies to the widow ANNE; for sure, she has a hard lot of it, as every poor widow must have, with nothing to depend upon for support but the scanty wages that women receive for their toil. She might find families who would adopt her children, but she does not wish to part with them, and I do not blame her for that. She is capable of instructing them, and instilling such principles in their minds as will render them useful when they attain sufficient age to act a part in the drama of life. Then I will go and see SWIFT, that poor, intemperate man, who lives beyond there, and try to aid him by giving him some employment. That will keep him from the tavern some of the time, and I will talk kindly with him, when he is sober, and perhaps I can convince him that it would be much better for himself and family if he did not go to the tavern at all, for he could govern his appetite much better by avoiding the presence of temptation. I will try to convince him how soon the money he spends there would purchase him a little land—build him a small house—clothe himself and family comfortably, and perhaps prevent him from becoming a criminal as many drunkards have done. It is said there is a door in every one's heart; I will try to find that door in his, and if possible shut the demon intemperance out."

Onondaga Co., N. Y., 1859.

LACONICS.

LIES are hitless swords, which cut the hands that wield them.

WHAT is that which shows others what it cannot see itself? A mirror.

THE costume of the Spanish ladies has not changed for two hundred years.

INK is a caustic which sometimes burns the fingers of those who make use of it.

AN indiscreet person is like an unsealed letter, which everybody can peruse.

HE is no mean philosopher who can give a reason for half of what he thinks.

HE only is independent who can maintain himself by his own exertions.

TO speak harshly to a person of sensibility is like striking a harpsichord with your fists.

RELIGION and medicine are not responsible for the faults and mistakes of their doctors.

TO act upon a determination made in anger, is like embarking in a vessel during a storm.

ALWAYS be up at sunrise if you wish to have the most golden of prospects.

A HEAD properly constituted can accommodate itself to whatever pillows the vicissitudes of fortune may place under it.

IT is a pretty saying of an old writer, that men, like books, begin and end with blank leaves—in fancy dead senility.

TO do good to our enemies is to resemble the incense whose aroma perfumes the fire by which it is consumed.

IN the conception of Mahomet's paradise, there is no distinction between a perfect woman and an angel.

WISDOM is the olive which springs from the heart, blooms on the tongue, and bears fruit in the actions.

LIFE may be merry, as well as useful. Every person that owns a mouth has always a good opening for a laugh.

"JUST put that back were you took it from?" as the Irish lass said, when young RORY snatched a kiss.

THE man who endures a pathetic song is capable of anything—even of sending his plate twice for soup when it tickles his palate.

THE FUNERAL.

And this is all! The long procession's pride,
The plumed hearse, the hatchment and the pall,
One tear of sorrow doth outweigh them all—
One drop o'erflowing from affection's tide,
Such has been here. The last of a long line
In the dim chamber of the tomb was laid;
The seeming of regret had been displayed.

Coldly—most coldly o'er his burial place
The mourners passed and smiled; but one was there,
Her pale face in her mantle almost hid,
And her heart swelling with a voiceless care;
She dropped a flower upon his coffin lid,
Thus, the true sorrow o'er the stately dead,
Was that young orphan's, whom his bounty fed.

THE DISCIPLINE OF DAILY LIFE.

THE reason why we have so many crosses, trials, wrongs and pains, is here made evident. We have not one too many for the successful culture of our faith. The great thing, and that which it is most of all difficult to produce in us, is a participation of Christ's forgiving gentleness and patience. This, if we can learn it, is the most difficult and the most distinctively Christian of all attainments. Therefore, we need a continual discipline of occasions; poverty, sickness, bereavements, losses, treacheries, misrepresentations, oppressions, persecutions; we can hardly have too many for our own good, if only we receive them as our Saviour did his cross. It is by just these refining fires of trial and suffering, that we are to be most advanced in that to which we aspire.

We have not too many occasions given us for the exercise of patience; which is yet more evident when we consider the Christian power of patience. How many are there who by reason of poverty, obscurity, infirmity of mind or body, can never hope to do so much by action, and who often sigh at the contemplation of their want of power to effect anything. But it is given to them, as to all, who suffer; let them only suffer well and they will give a testimony for God, which all who know them will deeply feel and profoundly respect. It is not necessary for all men to be great in action. The greatest and sublimest power is often simple patience; and for just that reason we need sometimes to see its greatness alone, that we may embrace the solitary, single idea of such greatness, and bring it into our hearth unconfused with all other kind of power.—Selected.

LITTLE SINS.

LET us be on our guard against little sins; against what men call little sins, for there is nothing really little in the way of sins. Watch against anything that wounds the conscience, however slightly. Conscience is a sacred thing. Guard well your spiritual life. Watch against the little sin that insensibly may wound and thus in the end destroy. You can easily kill a man by stabbing him with one blow to the heart. But may you not easily kill a man also by opening a little vein in his wrist? The blood may only flow drop by drop, but if you don't stop that wound, you will bleed to death, and just as surely as if one plunged a dagger into your heart, and sent you into eternity in a moment. Beware, then, of the little things that keep the wounds of the soul open; guard against little sins, which, if not guarded against, will as surely destroy the soul as one great sin.

John Newton says Satan seldom comes to Christians with great temptation, or with temptations to commit a great sin. You bring a green log and a candle together, and they are very safe neighbors. But bring a few small sticks and let them take fire, and the log be in the midst of them, and you will soon get rid of your log. And so it is with little sins. You will be startled with the idea of committing a great sin, and so the devil brings a little temptation, and leaves you to indulge yourself. "There is no great harm in this," "no great peril in that," and so by these little chips we are first easily lighted up, and at last the great green log is burned. Watch and pray, that ye enter not into temptation.—Rev. Newman Hall.

I WILL not quarrel with you about my opinion, only see that your heart is in the right toward God, that you know and love the Lord Jesus Christ, that you love your neighbor, and walk as your Master walked, and I desire no more. I am sick of opinions; I am weary to hear them; my soul loathes this frothy food. Give me solid and substantial religion; give me a humble, gentle, lover of God and man; a man full of mercy and good faith, without partiality, and without hypocrisy; a man laying himself out in the work of faith, the patience of hope, the labor of love. Let my soul be with these Christians, whosoever they are, and whatsoever opinion they are of.—John Wesley.

THE piety which is faithful in that which is least is really a more difficult piety than that which triumphs and glares on high occasions. It requires less piety to be a martyr for Christ, than it does to look upon the success of a rival without envy, or even to maintain a perfect and guileless integrity in the common transactions of life.—Horace Bushnell.

THE Forest Trees.—Build your nest on no tree here; for you see God hath sold the forest to death, and every tree upon which we would rest is ready to be cut down, to the end that we may flee and mount up and build upon the rock.—Rutherford.

A WEEK filled with selfishness, and the Sabbath stuffed full of religious exercises, will make a good Pharisee but a poor Christian. There are many persons who think Sunday is a sponge with which to wipe out the sins of the week.—Becher.

EDUCATIONAL

WRITTEN FOR MOORE'S RURAL NEW-YORKER.

RULES TO BE OBSERVED BY SCHOLARS.

Messrs. EDS.:—I will give you a few rules which I have observed myself, and which I know to be beneficial. Will not some of your young readers try them? Arise at 6 o'clock in the morning. No person who makes any pretensions to industry will suffer himself to sleep away time after this hour. Study at least one hour before breakfast. Wash in cold water, and at the breakfast table guard well your diet. Eat sparingly of rich or highly seasoned food. No scholar can make rapid progress who indulges in eating such food as will employ the nervous fluid most of the time in the stomach to carry on the process of digestion, when the same is required in his head to digest his thoughts.

Eat no fat pork and but little grease of any kind. To eat much of such food makes a scholar feel dull, sluggish and sleepy. Drink no tea or coffee—nothing but cold water. In short, let your diet consist principally of vegetable food, indulging but rarely in animal food of any kind.

Be sure to get into the school-room before school has commenced. This will enable you to confer with your teacher upon any point of difficulty that may have arisen during your morning study. If, however, by any mishap, you should not be able to get in until after school has commenced, then let it be your aim to come in very still, so as not to annoy the rest of the school. Do not, by any means, allow yourself to come into the entry and there stamp the snow or mud from off your feet till you have attracted the attention of the whole school; and then, worse than all, open the door and stamp through to the stove. This is very annoying to the whole school; perfectly distracting to the teacher, and without, entirely unnecessary.

Did you ever think what an easy matter it would be to come into the entry at such times very still, take the broom and brush your feet, and then enter the school-room so quietly as to attract the attention of neither scholars nor teachers. With regard to your deportment after you have entered the school-room it will be only necessary to observe that it should correspond throughout the day with this beginning. Be studious in school hours: let your motto be diligence, energy and perseverance.—When out at play be lively and cheerful.

In conclusion, may be allowed to say that any scholar who will put these regulations rigidly in practice, will not only stand a hundred chances to one of making rapid progress in his studies, but also of far surpassing such of his mates as are accustomed to rise at pleasure in the morning, gorge themselves with plenty of rich food, fat pork and grease not excepted, and then lotter into school at a time most convenient to themselves.

Hindrances to Study.—To be enabled to make improvement in the acquisition of knowledge, it is essential that the mind be in a state to *relax* the beauties of natural science, otherwise it will be useless for either parent or teacher to make any effort to implant useful ideas in the youthful mind. If our minds are not in a fit state for the reception of knowledge it is evident that the days of our youth will soon be spent, ripened manhood will appear, connected with ten thousand circumstances that will require the practice of that mental culture we ought to have acquired when the mind was elastic, and susceptible of almost unlimited expansion.

And, I ask, can our minds be in this "fitting state," if excited to unhealthy action and vitiated by a perusal of the yellow covered literature of the day?—by reading and pouring over the "thrilling tales" of experienced novelists? Parents, teachers, think of this! See to it that the minds of your children and pupils are not contaminated, aye, and diseased, by this or any other practice.—J., *Affidience, N. Y.*

Teacher's Faults.—Teachers, show no partiality in your school. Deal openly and frankly with all, and endeavor to do all you promise to do for your pupils. Never promise to have an exhibition or a spelling school which you have no notion of, when speaking to your pupils; and when once the promise is made, fulfill it at all costs. For, if you deceive them once or twice, they will not respect your word. Never promise to give a premium without performing, unless the reason for so doing is clearly set forth, that all may understand it. I have known evils result from such practices.—A RURAL READER, *Robertville, Stark Co., O.*

Common Schools or Missouri.—The annual report of the Superintendent of Common Schools of Missouri shows the amount of money apportioned for the school fund of that State, to have been \$244,993.54 in 1853; the number of children between five and twenty years of age was 341,121; ratio, 70 cents. Number of school districts in the State, 4,640; school houses, 3,382; colleges, 22, academies, 91; male teachers, 8,545; female teachers, 653; children attending school, 141,328. The amount apportioned for the school fund in 1857, was \$235,911.94; the number of children between five and twenty years of age was 309,323; ratio, 78 cents.

The Children of N. Y. City.—Out of one hundred and twenty-three thousand, five hundred and forty-seven children between the ages of five and fifteen years, in the city of New York, forty-one thousand, eight hundred and ninety-eight, more than one-third of the whole number, go to no schools public or private, and receive no sort of education but that furnished in the streets. In connection with this fact the New York *Express* remarks:—The citizens of New York cannot afford to be taxed over a million dollars annually for the support of common schools, and yet let more than one full third of her children go without a shadow of schooling.

HOW TO READ WITH PROFIT.

For the sake of those who are not accustomed to systematic reading, we make some suggestions as to the best mode of reading, so as to gain the highest advantage from the books they peruse.

1. Ascertain the aim of the author. You will thus know what to expect from his book, and may save much time, which might otherwise be spent in looking for what you could not find. An attentive reading of the title page, preface, and table of contents, will enable you to judge pretty accurately what the author is about. Some facts, too, which float only among intelligent men, will aid you greatly in these matters.

2. Read *carefully and attentively*, and with a determination to comprehend thoroughly the book you are perusing. Read neither credulously nor skeptically, but candidly; endeavoring to go to the root of the matter, if possible. One hour of such reading is worth a week of the superficial reading which is so common.

3. Read with a *good dictionary at your elbow*, and consult it freely whenever you meet a word you are not sure you understand. Webster and Worcester are the best in general use. We use Webster. Never pass an important word without mastering its meaning in the work you are reading. In this way you will soon gain a good stock of words for your *own use*, while you are learning the meaning of the book you are reading.

4. After reading a chapter, close the book and try to recall, and state briefly in your own language, the substance of the chapter, in the order the author pursues. This is one of the most profitable exercises. It will show you just how much you have gained by reading. If you cannot do this, just read the chapter again. The second reading will probably do you some good. The first reading has been of little use to you, if you are unable to state what the main thoughts are.

5. If the book is your own—but not, if it is a borrowed one—you may mark with a pencil the most important thoughts. You will thus remember them more easily, and can refer to them more readily.

Adopting these suggestions, you will read slowly, but what you read will become *yours*. It will stir up your own thoughts, and probably develop your mental powers as healthfully as any other discipline you can have.—*Ohio Farmer.*

Never forget the kindness which others do for you, nor remind others of the kindness which you do for them.

The Reviewer.

THE NEW AMERICAN CYCLOPEDIA: A Dictionary of General Knowledge. Edited by GEORGE RIPLEY and CHAS. A. DANA. Volume V. Charleuse—Coughar. New York: D. Appleton & Co. [pp. 170.]

This is one of the most interesting volumes of the Cyclopædia yet issued. It comprises some twelve hundred subjects, with descriptions, definitions, &c., including a large number of distinguished names and important topics. Among the biographies are those of Chatterton, Chaucer, Clay, Clinton, Cobbett, Coke, Coleridge, Columbus, Combe, Cooper, and a host of other distinguished men of the past and present. Of the numerous important subjects treated upon with ability and research, the most prominent are—Chemistry, Chinese Language and Literature, Chivalry, Christianity, Chronology, Clocks and Watches, Climate, Coal, Coast Survey, Coins, Color, Commerce, Common Law, Common Schools, Comparative Anatomy, Congregationalism, Consumption, Copper and Copper Mines, Costume, Cotton and Cotton Manufacture, &c., &c. Among the Cities, States, &c., are Chicago, Cincinnati, China, Constantinople, Connecticut, Costa Rica, &c. A list of the contributors to the first five volumes is given at the conclusion of the volume, and comprises the names of many literary and scientific celebrities. Among the contributors to the fifth volume we observe the names of Bancroft, Dr. Cummings, Geo. N. Curtis, Dr. Edwards, Emerson, Everett, Greely, Hildreth, T. Starr King, Shelton Mackenzie, Seward, Dr. Sears, Sumner, and a host of eminent scholars in the various professions. It is rare indeed that the fruits of so much varied talent and research are comprised in a single volume.

We again commend the "New American Cyclopædia" to all who can make use of it, and as indispensable to every library of any note, whether public or private. For sale in Rochester by D. M. Dewey.

THE NEW YORK STATE BUSINESS DIRECTORY.—Containing the Names and Addresses of the Merchants, Manufacturers, Professional Men, &c. Also, a list of Banks, Insurance Companies, Railroads, Newspapers, &c., &c. [Being Part I of the Middle States Directory.] By ADAMS, SAMUEL & CO., Publishers of the New England Business Directory, and Directories for Albany, Troy, Boston, &c., &c.—Principal Office No. 91 Washington St., Boston. New York: John F. Trow—1859.

In a closely printed volume of over 700 pages, we here have a large amount of information of great value, and which cannot be obtained elsewhere. Indeed, the work is a long-sought desideratum, as no other Directory of this State has been issued in ten years. It comprises the names of 124,000 business and professional men, arranged under the heads of the several trades and professions, located in various cities and towns of the State; also a complete list of Post-Offices, Towns, &c., with much other information, as indicated in the title. So far as we have examined, this Directory appears to be far more accurate and reliable than most works of the kind, and we daily have occasion to refer to its pages. The price of the work is \$3. It is now being delivered to subscribers and purchasers, and may be obtained of D. M. Dewey, Rochester, or on application to the Publishers, 78 State St., Albany.

TRAVELS AND DISCOVERIES IN NORTH AND CENTRAL AFRICA. From the Journal of an Expedition undertaken under the auspices of H. B. M.'s Government, in the years 1848-55. By HENRY BARTH, D. C. L., &c., with notes and extracts from Mr. RICHARDSON'S account of the Expedition, by the American Editor, and Clapperton's Expedition, by the American Editor. Phila.: J. W. Bradley. 12 mo. pp. 588.

This is a condensed account of the journeys and discoveries of Dr. Barth, and perhaps, on account of its cheapness, may be better adapted for general circulation than the large work in three volumes, which we noticed in our issue for March 19th. How judiciously the American editor has performed the work of condensing the five volumes, as originally published, into one, we cannot say. He claims, however, to give, almost entirely in the author's own words, all the really important and interesting portions of his journal, omitting only uninteresting details. The work is illustrated with numerous wood-cuts, but they are not models of art, nor is the printing just what it should be to make a fine book—though perhaps both are as good as could be expected in a cheap, popular edition. Sold in Rochester by ALLEN & CO., Exchange St.

WILLIAM A. ALCOTT.

A GREAT man has rested from his labors. On the first of April, Dr. WILLIAM A. ALCOTT departed this life in Boston, aged about 61 years. While we rejoice that the pious dead are blessed, and that their works follow them, it is well for the world that the works of the good man live, and the influence of his labors is felt long after the soul returns to God who gave it, and the body is mingled with the earth from which it came. The amount of good done, the sacrifices made and the privations endured in its performance, is the only true test of true greatness. Judged by this standard, the subject of our brief sketch was truly great. The results of his labors will be felt for ages, exerting a marked influence for good upon the education and happiness of millions in every civilized land. He was one of the noblest pioneers in the reformation of Common Schools in New England; an indefatigable laborer in the cause of popular education. While working with untiring zeal to give to every child an opportunity to improve the mind, he was extremely anxious that this should not be gained at the sacrifice of either health or morals. When asked by a distinguished educator what he considered the capital error of modern education, he replied, "the custom of pushing the cultivation of the intellect at the expense of health and morals." Since that time, (1830), much improvement has been made in this respect, yet, perhaps, even now this is the best reply that could be made to the question.

WILLIAM A. ALCOTT was born in Wolcott, Conn., on the 6th day of August, 1798. His opportunities for education were confined to the "District School as it was," for a few months each year, principally in the winter, where he learned reading, writing and spelling. His mother, however, who had been a school teacher in her youth, instructed him in arithmetic and some other English branches, repeated to him the substance of books with which she was familiar, but which were not now accessible to either, and thus awakened that love of study and thought, and instilled into his mind those noble, self-sacrificing principles which ever characterized him. Another evidence of the power of the mother in moulding the character.

His darling project, all through the earlier years of his life, was to become a printer. Circumstances prevented this, and until eighteen years of age he was compelled to work on the farm during the summer months, improving, however, every leisure moment in perusing the books that he was able to obtain from the libraries of friends. These books he did not merely read, but made extensive notes of interesting passages, even copying rare works entire. With such perseverance he could not fail to make his mark in the word, and we commend this example to young men and women of the present day, who can hardly find patience to read a dull book, and consider everything dull but an exciting novel. Although he was sadly disappointed at being unable to become a printer, we have no doubt the farm work which circumstances compelled him to perform, was much the best calculated for the development of both body and mind. Of delicate constitution, and threatened with pulmonary disease, if he could have followed his inclination he might have found an early grave.

At eighteen years of age he commenced teaching a common school in his native town, and continued in this work for about eight years. He soon commenced a war of extermination against the high, uncomfortable benches without backs, and after a good deal of effort was enabled to introduce more comfortable seats. Heat, ventilation, and the

general appearance of the school room next claimed his attention, and thus commenced a reform which was long and sorely needed, and which has resulted in making our school houses, where our children spend so many of their wakeful hours, comparatively pleasant and healthful.

In 1824 Mr. ALCOTT commenced the study of medicine, continuing teaching, however, most of the time, and in 1826 received a regular license to practice medicine and surgery. His health being such as to prevent his teaching, he practiced medicine for about four years, when his health becoming much improved, he returned with delight to his favorite work of instruction.

In 1830 he became connected with Rev. Wm. C. Woodsbridge, in an attempt to advance the interests of education in Connecticut, by establishing a school for the special instruction of Common School teachers, and to this end made various appeals in the journals of the day, wrote essays, delivered lectures, and visited schools, with a zeal and earnestness that never tired.

To aid in the work in which he was engaged, he conceived the idea of establishing an Educational Journal, but indigence and other obstacles prevented. In 1831 his friend and associate, Mr. Woodsbridge, having purchased the Journal of Education, which he was editing, at his urgent solicitation Mr. ALCOTT removed to Boston, and became an associate editor of that Journal. He also edited a child's weekly paper, called the *Juvenile Rambler*, and for four years was the editor of that popular juvenile monthly, *Parley's Magazine*.

About this time he commenced those series of works which have rendered his name a household word wherever the English language is spoken. The most popular of these were "The House I Live In," "The Young Mother," "The Mother in the Family," "The Young Husband," "The Young Wife," "Lectures for the Fireside on the Ten Commandments," etc., etc. To show the untiring industry of the subject of this brief memoir, we need only state further that he was the author of over one hundred works, mostly of a respectable size. Fourteen of these books were designed more particularly for teachers and the friends of education; thirty treated of physiology, physical education and health; fourteen were books for the family and school library; and over forty were designed for Sabbath School Libraries, and they are the most useful of our Sabbath School books. In addition to these he preserved copies of over a thousand articles which he contributed to the periodical press.

But, his labors are ended—his work is done, and who will say that it is not well done. Still, we must say that, while there is much to admire in his system of government, both for the family and the school, we never could love his stern discipline—his military rule, where the slightest violation of law required an adequate punishment. It seemed too much of justice, unmixed with mercy. We would rather conquer by love. In this respect, we observed a marked improvement in his later works, and could he live his life over again, we have no doubt he would govern more by the law of kindness. Stern and exacting to himself, abstemious and self-sacrificing to a fault, it is not strange that he should show a little of the same sternness in his treatment of others.

The portrait which we give was engraved for the *Rural*, from a fine steel plate in *Alcott's Fireside Lectures*, published by E. DAWSON & BRO., of this city, and was engraved from a photograph likeness. It is the only portrait of Mr. Alcott, we believe, in existence.

Books Received.

THE PILLAR OF FIRE; or Israel in Bondage. By Rev. J. H. INGRAHAM, Rector of Christ Church, and of St. Thomas Hall, Holy Springs, Miss.: author of "The Prince of the House of David." New York: Putney & Russell. [12 mo.—pp. 606.] Sold by D. M. Dewey.

THE LAST OF THE MOHICANS.—A Narrative of 1757. By J. FENIMORE COOPER. Illustrated from Drawings by F. O. C. DARLEY. New York: W. A. Townsend & Co. [12 mo.—pp. 448.] D. M. Dewey subscription agent for Rochester and vicinity.

MATHEMATICAL BOOKS IN THE METROPOLIS.—Being Two Narratives of Strange Adventures in New York, and Starting Facts in City Life. By a Reporter of the New York Press. New York: Thatcher & Hutchinson. [pp. 350.] Sold by DEWEY.

ORIENTAL AND WESTERN SIBERIA: A Narrative of Seven Years' Explorations and Adventures in Siberia, Mongolia, the Higher Steppes, Chinese Tartary, and part of Central Asia. By THOMAS W. ATENSON. Philadelphia: J. W. Bradley. [12 mo.—pp. 499.]

TWO WAYS TO WEDLOCK. A Novelle. [Reprinted from the New York Home Journal.] New York: Rudd & Carlton. [pp. 238.] For sale by DEWEY.

THE LADY OF THE ISLE. A Romance from Real Life. By Mrs. EMMA D. E. N. SOUTHWORTH, author of "Retribution," "Deserted Wife," "Missing Bride," etc. Philadelphia: T. B. Peterson & Bros. [12 mo. pp. 598.] For sale by DEWEY.

HOME MEMORIES; or, Echoes of a Mother's Voice. By Mrs. CAROL BROOK, author of "Children at Home," "Working and Waiting," etc. New York: D. Appleton & Co. [12 mo.—pp. 329.] Sold by DEWEY.

THE CULPRIT PAT. By Jos. Rodman Drake. New York: Rudd & Carlton. [pp. 62.] Sold by DEWEY.

COUNTRY AND CITY BOYS.

Messrs. EDS.:—Though a resident of the city, I take the liberty to address you concerning many things, the bearings of which I have been enabled to perceive from a stand off point of view. I have taken the story-papers of New York city until I became fairly sick of the sentimental nonsense contained in them. My only relief is now found in the pages of your paper. It is of such a miscellaneous character that the tastes of all are gratified—the farmer, the artisan, the teacher, the school-boy,—all, young and old, find equal delight. That is the sort of a newspaper we want,—none of those flaring novelettes, and yet as the *Rural* proves, an agricultural paper need not be dull or destitute of life and interest for all.

Whoever has lived any considerable time in the city will be able to perceive the demoralizing effects of such society on all around. The young urchin, before he is able to eat his victuals with any tolerable degree of propriety is seized with a great craving for tobacco. This is the prelude to indulging in spirituous liquors, visiting engine-houses, theatres, &c. There is none of that characteristic, genuine refinement and modest good manners which belongs to our country youth.—That is the moral education which most city boys receive, and what are its effects? The history of our country at the present day shows.

Country boys when they come into the city are often jeered at, called "clowns," "gawks," and sundry other appellations of the curb-stone nomenclature. At our country fairs, many young people from the rural districts, station themselves with various articles on exhibition. They neither hurt anybody nor resent an injury, and yet they are sometimes beset by a loafish class who swarm in from any neighboring city. They do not even pay their fare if they can possibly avoid it, but climb under the fence, over the fence or jump on behind a farmer's team as it enters. Some of the worst steal melons and throw the rinds back in contempt at those whom they robbed of their lawful property.

Country boys, I know, are ignorant of a great many things with which city boys are familiar, and I am glad of it. Is it any discredit to be ignorant of their wicked ways? Not in the least. The look of many innocence and good sense is often mistaken by these boys as the mark of an ignorant and sheepish spirit. Boys do not be affected by this.—Do not even desire the praise of the bad, and above all, do not endeavor to imitate these rowdies. You will be more respected if you remain even unconcerned of the existence of such sinful disposed, boys and their practices.

ARITHMETICAL CALCULATION.

Messrs. EDS.:—I have been a friend and reader of the *Rural* several years past, and I always am gratified when it comes, especially in perusing the columns devoted to the "Young Ruralist" and "Youth's Corner." And when I see so many boys of my own age contribute to its columns, I feel as though I ought to send in a few lines. In your issue for Feb. 19, 1859, "Omnus" requires the reasons of several questions. I think that they have not been answered. In accordance with his request I will give my reasons. The question read:—Why does multiplying a number make it smaller? (suppose he means produce a smaller number.) Why does dividing a number make it larger (or produce a quotient greater than the dividend,) and, why do we place the decimal point where it is? For the first, What is it to multiply? Ans. It is to repeat a number, called the multiplicand, as many times as there are units in another, called the multiplier. If there is one unit in the multiplier we repeat the multiplicand once, if seventeen we repeat it seventeen times, if $\frac{1}{2}$ of a unit we repeat it $\frac{1}{2}$ of a time, if $\frac{1}{1000}$ ths of a unit we repeat it $\frac{1}{1000}$ ths of a time, and so on invariably, taking such a portion of the multiplicand as often as there is a like portion of a unit denoted by the multiplier. For instance take the number 22.64 multiplied by .006, the product is .13584. We have taken six thousandths of the multiplicand and the product is less than the multiplier. And invariably when the multiplier is less than a unit the product is less than the number multiplied. In multiplying the number before stated we multiply 22.64 by .006 and we have for a product 13584.—In the first place, if we multiply the numbers as though they were whole numbers, our product would be .13584 without regard to the point. We have multiplied the number 2264 which of course is one hundred times too large. To produce the correct product we must therefore divide it by one hundred which is simply removing the decimal point two places towards the left, and our number is 135.84, that is, the multiplicand multiplied by 6. But our multiplier is six thousandths. Our product is one thousand times too large yet. In remedying this fault we divide it by one thousand, which is simply removing the decimal point three places towards the left and we have the number .13584 which is the correct product. In all we have pointed off five decimal places which, to shorten it, is the same number of decimal places as there are in both factors counted together. Hence, we have the rule—point off as many from the right of the product for decimals as there are decimal places in both factors. Pointing off in division of decimals is simply the reverse of multiplication of decimals. The product in multiplication answers to the dividend in division and the factors to the divisor and quotient. Then, also, the decimal places of the dividend, are equal to those of the quotient and divisor. We have those of the dividend given and those of the divisor, those of the quotient must be as many as those of the dividend exceed those of divisor. The quotient must make up the excess, for the decimal places of the quotient and divisor must be equal to those of the dividend. There might also be given a demonstration to division of decimals, but I must ask pardon for the space that this occupies.

TWO DOLLARS A YEAR.]

"PROGRESS AND IMPROVEMENT."

[SINGLE NO. FOUR CENTS.]

VOL. X. NO. 17.]

ROCHESTER, N. Y.,—FOR THE WEEK ENDING SATURDAY, APRIL 23, 1859.

[WHOLE NO. 485.]

MOORE'S RURAL NEW-YORKER,
AN ORIGINAL WEEKLY
RURAL, LITERARY AND FAMILY NEWSPAPER.

CONDUCTED BY D. D. T. MOORE,
With an Able Corps of Assistants and Contributors.

TERMS, IN ADVANCE:

TWO DOLLARS A YEAR—\$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for \$5; Six, and one free to club agent, for \$10; Ten, and one free, for \$15; Sixteen, and one free, for \$22; Twenty, and one free, for \$30; Thirty-two, and two free, for \$40, (or Thirty for \$37.50) and any greater number at same rate—only \$1.25 per copy—with an extra copy for every Ten Subscribers over Thirty Club papers sent to different Post-offices, if desired. As we pre-pay American postage on papers sent to the British Provinces, our Canadian agents and friends must add 13½ cents per copy to the club rates of the RURAL. The lowest price of copies sent to Europe, &c., is \$2.50—including postage.

THE POSTAGE ON THIS RURAL is only 3½ cents per quarter to any part of this State, and 6½ cts. to any other State, if paid quarterly in advance at the post office where received.

37 All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

OATS, THEIR USE, PRICE, AND CULTURE.

Of all the cereals, the oat is, perhaps, the most generally cultivated, and the least liable to disease or injury from insects. It is successfully grown throughout a wide range of latitude, enduring almost Siberian cold and tropical heat,—and on the poorest sandy soil, the stiffest clay, or the more genial loam. Though used in this country principally for food for the horse and other working animals, in some parts of the world, as in Scotland and in Ireland, it is one of the chief articles of human food. Scotland is called the "land of cakes," from the fact that cakes of oatmeal form the principal support of her laboring population, while the *stirabout*, which is a thick mush, made of this meal, is an every-day dish, both in Scotland and Ireland. In various parts of Canada, oatmeal is largely manufactured, and is freely used by settlers from Europe, and a portion of this Canadian meal finds a market in the United States, and can be purchased in most of our cities. By many, and generally by Europeans, it is preferred to the meal from Indian Corn. The principal demand for oats, however, in this country, is to supply our cities with a nourishing food for horses, that will enable them to endure the external hard work with which many of the poor animals are taxed.

The price of Oats ranged in Rochester during the last year from 35 to 45 cents, and most of the time would sell readily at about 43. In New York city the range is about five cents per bushel higher, and in Chicago a few cents lower. The average yield in this section of country, on fair soil and tolerable culture, is something over thirty bushels to the acre, though double this quantity is sometimes grown. In looking over more than a dozen experiments made in England, we find that the smallest yield reported was 48 bushels, and the largest 92. From these facts our readers may be able to judge somewhat of the prospects of profitably growing oats. In making a calculation of this kind, however, it should be remembered that the straw of the oat is much more valuable than that of most cereals, either for sale in cities, or feeding, and also that it is at least one of the best with which to seed down to clover.

There are very many varieties of oats, differing in weight and productiveness. Thirty-two pounds to the bushel is about the ordinary weight, but the finer varieties often weigh as high as 40, and we have seen oats weigh nearly 60 pounds. From the last Transactions of the N. Y. State Agricultural Society, we learn that the sample which took the first premium in 1857, weighed 43 pounds, the second 42, and the third 41. The varieties are not given. Morton numbers forty-five varieties cultivated in England. "The different kinds of oats are distinguished from each other by a variety of characteristics, such as color, size, and form of seeds, quality of the straw, the period of ripening liability to shed their seeds in high winds, and adaptation to particular soils and climates.—There are three principal groups of oats, easily distinguishable by color; white, black, and gray, or dun. White oats are separable into two principal varieties, the late and early, and these again into several sub-varieties, characterized by certain peculiarities of growth.

Early oats are best adapted for the better class of soils, as the greater yield per acre more than

compensates for the inferiority of the straw.—Their earliness renders them very suitable for late districts; but the liability of some to shed their seeds in high winds, renders their cultivation in high-lying and exposed situations extremely hazardous.

Late, or common oats, as they are more generally termed in Scotland, are distinguished from the early variety by late ripening, thicker husk, and less meal; the latter being of better quality, lighter per bushel, not usually so prolific; the former, however, have a more vigorous constitution, and are better able to resist the effects of atmospheric changes, such as rains or droughts, and when ripe they are less liable to shed their seed in high winds; the straw is greatly superior as fodder; and lastly, they can be cultivated with greater success than the earlier varieties on inferior soils, and those of a strong clayey nature.

Black oats are of two kinds, the one the Tartarian, having the ear only on one side of the straw, and the other the old or common black, with black seeds, but having a spreading ear, similar to the white varieties. Dun oats are to all appearance hybrids between the last mentioned variety and one or other of the white sorts, most probably the late or common white oat, as they have more of the characteristics of the last mentioned; such as hardiness, lateness, adaptation to clayey and cold-bottomed soils, and by the superior quality of the meal and straw." In another number we will give descriptions, and perhaps engravings, of some of the best varieties.

Oats are sown any time during May, and even as late as June, but it is usually found that the earliest sown yield the best. A change of seed is of great benefit, as oats will deteriorate if sown for a series of years on the same soil. Morton says "the best and soundest oats for seed are produced by land of a firm clayey nature, situated in an early climate; and in changing seed from one locality to another that from which the seed is obtained should be earlier than the one where it is to be sown. Experiments show a loss of four bushels to the acre, solely from taking seed-oats from a later to an earlier soil. The heaviest oats are not always the best for seed, because great weight per bushel is generally indicative of a thin husk; and hence the germ being unprotected is very apt to receive injury from any excess or deficiency of moisture in the soil at the period of germination." Many of the best Scotch farmers invariably sow seed two years old, and contend that thereby the plants are more healthy and vigorous, and the yield much greater than if the seed of the last year was used. It is also a custom to mix two varieties in sowing, both ripening about the same time—one that is apt to grow weak-strawed and thin upon the ground, but productive, with another that is strong-strawed, grows thickly on the ground, but less prolific.—This course is said to yield a better crop than though either was sown separately. Farmers differ very materially as to the amount of seed necessary, some say two bushels, others nearly or quite double this amount, while the Scotch farmer will sow 5½ bushels of some varieties. Such excessive seeding, however, is condemned by the more intelligent.

THE RURAL SKIES BRIGHTENING!

Under the heading of "Farming Prospects," the N. Y. Tribune has a brief but suggestive and comprehensive article. Though some of its advice is, perhaps, too late—such as the admonition about preparing "to double in '59 the Grain crop of '58," inasmuch as winter grain cannot now be increased, while farmers have very generally made their arrangements for Spring crops, &c.,—the facts and logic presented are worthy of special consideration, and such action as may be consistent on the part of cultivators. After stating that Winter Grain generally looks well throughout the country—much better than could be expected, considering the open winter—and confidently hoping for heavy crops of both Wheat and Rye, the Tribune says:

"But it must be considered that the general yield of Grain last year was a very light one throughout the Free States. Wheat did well in the South, as did Indian Corn in the North; but the Great West—the granary of America, and to some extent of Europe also—had a lighter yield per cultivated acre than ever before. We estimate the Wheat crop of the entire Union at less than ten bushels per acre, and that of the Free States at less than eight bushels. Michigan, Wisconsin and Minnesota had the best of it; but even they did not average a middling crop of Oats. Hardly a third of a crop was realized throughout the country—in the West, hardly more than was sown. Indian Corn did better—in the North, very well; in the South, middling well; in the West, there was rather more than half a crop, but not much more. Iowa had probably less; Illinois and Indiana, not much more; Ohio, at best, a light yield. The aggregate deficiency in the Grain-harvest of 1858 must be estimated by hundreds of millions of bushels.

"We say, therefore, to the few who have made the inquiry, and to whoever may think our opinion worth hearing. There is a positive and signal deficiency of Grain in the country at this moment, and you can hardly sow and plant too much. We do not mean that any man should plant or sow twenty acres when he has only help, team and fertilizers to cultivate ten thoroughly; but we do say, Put in the crops; put them in well, and as large an area as you can fully take care of. There is a great European War looming on the horizon—it may or may not break out this year, but all the craft of Diplomacy, all the pleadings of Christianity, cannot prevent it. That war will create an immense demand for our Provisions; but even were it to be ultimately averted, the immense preparations of the prospective belligerents, their mustering, marchings, and concentrations of troops; their diversion of Skill and Labor from productive industry to fortification, cannon-casting, the rifling of muskets, the manufacture of powder, &c., must create an extra demand for food. And not only is there much less Grain now in the country than usually at this season, but we hear complaints from various quarters of the scarcity of Fodder also—caused, in part, doubtless, by the deficient Grain harvest last year. Let the husbandman prepare, therefore, to double in '59 his Grain crop of '58, in the confident assurance that the fruits of his labor will command a liberal recompense."

FACTS ARE FALSE, AND FIGURES LIE.

The rankest falsehoods and the wildest absurdities come to us backed by the most formidable array of "facts and figures." Statistical people are the greatest blunders. Beware of the man who approaches you with a demonstration. Mathematics is the parent of moonshine. It comes in this wise: Truths are related—they are members of a family—stones in an edifice—parts of a whole; they should be considered in their relations, connections, and dependencies if you would use them for purposes of argument, illustration, or influence. A fact is a phase of being. It is what you find in a particular place at a particular time. If you will let it alone, it is a fact—a truth—but you harness it to some creed or theory, you consider it in its relations to other facts, and you are liable to misjudge those relations as a necessary consequence of human ignorance and imperfection. This statement has a wide application.

In politics, if the Currency is the topic, there is nothing but *Currency*—the world's axis turns upon "hard money" or soft. History reveals that a nation prospered in the use of paper money—"don't you see," says the bank man "the great fact that paper money is the source of national prosperity." The other side hunts up a nation that has prospered on hard money—that settles the question the other way. It don't occur to the contestants that the country may have prospered in spite of their favorite panacea, just as the man got well notwithstanding the doctor. Many a balsam has the credit of curing, simply because it didn't kill.

Among the myriad influences that modify results, how difficult to assign to each the share which belongs to it. I have a profound regard for my mother—I think she was right in saying that, "garden sauce saves bread, and ought to be attended to." But when my father justified his neglect of the garden, by saying that "cucumbers and cabbage are unhealthy," she ought not to have shut him up by replying—"the Dutch eat such things, are not the Dutch healthy?" The Dutch woman with her ruddy cheeks, and a bushel of potatoes on her head, owes more to her freedom from fashionable hours and fashionable food—to air and exercise, and uncompromised lungs—than to sour kront and boiled cabbage.

Happily, a spirit of investigation is abroad—it pervades even the domain of agriculture—may it be thorough and exact. One of my neighbors is particular to sow his onions in the old of the moon in April. He bears down on all opposition to the "old of the moon," by showing his onions, which are uniformly excellent. Perhaps I may be permitted to add, his ground is excellent, (a sandy loam, which has the wash of the barn-yard, and his cultivation is unsurpassed.

I was looking at a friend's sheep; they were good blood, well formed, and very fat. I praised them—he was pleased, and said he would tell me "the secret." he lowered his voice almost to a whisper, (no body was within a half a mile of us,) "I feed a little sulphur in their salt," he said.—Now, I guess sulphur is good—I mean bad—for the ticks, and for cutaneous diseases, (nobody ought to take medicine in health;) but I could not help observing, that the *pasture* was remarkably fine, and as the sheep were of good age, and had good constitutions, well adapted to laying on fat, I

KIRBY'S AMERICAN HARVESTER, AS A MOWER.

We take pleasure in giving an illustration and description of this valuable machine, which is gaining wide celebrity. It was extensively used in various parts of the country last season, and so far as we are aware, gave very general satisfaction. The manufacturers affirm that the marked success of this machine at the celebrated Syracuse Trial, in 1857, was followed by greater successes at various trials last season. At the Indiana State Trial, last year, the 1st premium for Combined Machine was awarded to Kirby's American Harvester, the Judges remarking, in their report, that it was beyond all question the lightest draft machine on exhibition, the actual draft for mowing being only 170 lbs. We believe it also received the 1st premium as a Combined Machine at the Indiana State Fair, and as a Reaper at the last New York State Fair—and the same rank at many County Fairs and Trials. The above cut represents the American Harvester as a Mower, but we shall hereafter illustrate the machine as a Reaper.

The following description of the machine, by the manufacturers, will give our readers an idea of its construction and operation:

"It is made entirely of iron, except seat and pole, and is consequently very durable. The castings are made of Salisbury iron, the finger-bars of refined wrought scrap, and the bolts of the best Norway iron with forged nuts. The finger-bar, frame and driving-wheel are so jointed as to act

entirely independently, each following the inequalities of the ground, and enabling the machine to do good work on very rough ground. It also permits the cutters to be set at any desired height, both in mowing and reaping,—thus adapting it to all kinds of ground and every variety of work. By means of a lever the driver can at pleasure elevate either end or both ends of the finger-board to pass over obstructions, carry his swath, or move from field to field. By another lever he can throw the cutters out and in gear while the machine is in motion.—The driver's seat is so pivoted over the driving-wheel as to take all pressure off the horses' necks and throw the weight upon the wheel. The driver's position is both easy and convenient, being back of the cutter-bar where he can keep the working of the machine constantly under his eye, and control its action by means of the levers within his reach,—while the gentle motion of his seat relieves him of the weariness of constantly sitting in one position. The driving head acts as a balance-wheel, does away with the necessity of constantly renewing boxes, and enables the operator to change the length of stroke—giving faster or slower motion as is desirable for different kinds of work. All parts of the machine are simple and durable, and it works perfectly, both in mowing and reaping.—Manufactured by the Buffalo Agricultural Machine Works, Buffalo, N. Y., and D. M. OSBORN & Co., Auburn, N. Y."

thought I saw other reasons than sulphur bearing on the case.

A farmer tries plaster, ashes, guano, or some other well known fertilizer, and pronounces it a humbug, another tries it with very gratifying results. What makes the difference? Perhaps one tries it a wet season, and the other in a dry one—one on clay, and the other on sand—one early and the other late—one on corn, and the other on wheat—one with the right quantity, and the other with the wrong. Gentlemen, you should notice all the qualifying circumstances, and in every experiment strive to ascertain the real causes of the results obtained.

One man is in love with a particular breed of cattle, sheep, or hogs; another condemns it entirely. Their opinions are not to be accepted without their reasons. One markets early, and of course requires what will mature early. One feeds high, and will be suited with high bred animals; another deems it essential that an animal should bear grief well. So of variety of grains, fruits, and vegetables;—each has its place, and there are circumstances in which it will do better than any other, and perhaps uses, which it will subserve better than any other.

Moral.—Be careful that your facts are not interferences, and wrong ones at that. Be careful that you trace results to their true sources, effects to their real causes. Be observing and inquiring always.—H. T. B.

BEE CULTURISTS are referred to an article entitled "The Apiarians in Convention," given on page 137—fifth page of this number.

WHEAT GROWING,—THE MIDGE. &c.

EDS. RURAL:—We are glad to see the wheat question occasionally agitated in the RURAL, as it not only involves a deep interest to the farmers of the Middle, but of the Western States, especially in the wheat growing sections. The earliest and hardest varieties should be procured, and after we are satisfied by experience that we have those kinds, the question arises how we shall get rid of that pest, the midge. It has been suggested (we think in the RURAL) whether slaked lime would not have a beneficial effect, if sown broadcast on the fields when wheat is in the right state for the midge. This we think might prove beneficial, but the idea is new to us. Will some one who is experienced, respond through the RURAL?—stating whether it will injure the crop if sown on when the grain is damp or wet, and the quantity of lime per acre? We have a beautiful field of wheat that we would like to try the experiment upon, if it will not injure the crop, and then report the result. Although we have escaped the midge, even the last season, whilst others near us met with entire failure, we don't say we farm any better than our neighbors, but we think there is something in farming, as well as in the kind of seed we sow.

We have a variety of Winter wheat which we consider better than any kind we have formerly grown. We obtained it of a farmer in Schuyler county, this State, who called it the "Favorite." In 1857 we sowed it the 7th of September, and harvested the 10th of July last; but as a general rule we think it will mature about the 15th of July in this section. We would recommend sowing between the 25th of August and the 8th of September.

and not later, especially in the fall. The reason we would not sow earlier than the 25th of August, is because the wheat gets too large in the fall, and a deep fall of snow is very apt to injure the crop by smothering. There is another kind of wheat sown by some about here, known as the Mediterranean. It is rather dark colored, and we think it does not fill as well as the Favorite. As a general rule it does not mature quite as early, say six or eight days later. We would recommend these two varieties in preference to all others in this section.

We have a preference in breaking up summer fallow. If possible we would break fallow the fall previous to the season we want to sow. We do not approve of putting on a spring crop, as formerly, or before the midge commenced its ravages. If we should sow a spring crop it would be peas in preference to any other. Some might say, why not plant corn in the spring on the fallow intended for wheat? Our answer is, it is difficult to get a spring crop off for the fall seeding.

For spring wheat we would recommend corn stubble, especially on gravel or clay loam soil. We would not sow spring wheat earlier than the 10th of May, and not later than the 15th of the same month. What say you, farmers? Let us have your experience, and thus benefit each other.

J. KIRKENDALL.

Steuben County, N. Y., 1859.

ABOUT SHEEP, AND THEIR CARE.

Mr. Moore:—I doff my hat to Messrs. Tabor and Graves, and own up beat. I am really pleased to know there are other farmers than myself who have a few good sheep. I clearly perceive that my sheep are nothing more than common, when compared with those of the above-mentioned gentlemen. There is some truth in the saying, "the man that tells the first story has no chance," not reflecting any doubts as to the truth of the above statements—for probably their reports will soon be eclipsed by other accounts far exceeding either yet made. Mr. Tabor really must have a fine flock of ewes, and yet he feeds no grain or roots. This is something that certainly needs explanation. What kind of sheep are they? How are they fed?—perhaps, like the Dutchman's horses, "they be fed mitch out straw and that poorly threshed."

Now, gentlemen, you might as well try to convince me that hogs would fatten on raw potatoes and dish-water, as that sheep will pay well without good care and feed in our changeable climate. Perhaps in some more Southern latitudes they will not really require the shelter and extra feed that they need here. I have been convinced for some time that my flock of sheep could be improved, and that it is a duty we owe to ourselves and the farming community generally, to make all the improvement that is within our reach. It costs no more, if as much, to keep a flock of sheep in good condition as it does poor and half-starved. When thriving, sheep are very seldom diseased, but when poor, they are seldom healthy. There is much cost to a farmer every year in his feelings, if his flocks and herds are lean and dying for want of proper care. Nothing can be more barrowing to a farmer's feelings than to find his stock and sheep decreasing in value for want of a little corn or oats. Every sensible wool-grower will find it for his interest to have his flock fat for the butcher or eastern market at all times, for it is a fact clearly established, that there is a certain season in each year when fat sheep bring an enormous price in New York and other eastern markets, and the cost and trouble of getting them there is but a trifle on our roads.

I hope the subject will not drop here, but that we may hear from more extensive wool-growers as to larger flocks paying, — the most profitable kinds of sheep to be raised, taking both wool and mutton into account.

Fluanna, N. Y., March, 1859.

OLD HAY vs. NEW, AND OTHER THINGS.

Ess. RURAL:—J. W. K. inquires about the ways and whereof of the difference between old hay and new, or rather why old hay, or that which has been summered over, is better than that foddered the winter immediately after cutting. A shrewd farmer of my acquaintance (now deceased) preferred old hay, because, as he averred, it was better than the interest of the money at the price the hay would bring if sold, and would not sell any surplus hay.

There are other articles considered better, or that will spend further for long keeping. The prudent housewife will not cut new bread for the table, because of the economy of the thing, older bread going further. My good wife says that old wheat is better than new—that is, there is more economy in using the flour of old than new wheat, although the new is more palatable to the taste. Old candles are said to burn longer than those fresh dipped or moulded. In the days when blacksmiths used charcoal in the forge, I have heard them say that old charcoal was a better investment than money at interest; how it is with stone coal I have not learned. As a cabinet maker I can testify positively that old copal varnish, or that which had been kept some time, was better than the fresh made, for I made my own varnish years ago. Old cheese is well known to spend further than fresh made, for the less quantity suffices the appetite. "Strong as old cheese" is an old saw.

Other things might be mentioned, but there are enough to establish the fact that many do believe, and practice on that belief on the score of good economy, and I think there is some ground for such notions. The reason why is rather more difficult to answer, and, like a good Yankee, I will give a guess—for not being a practical chemist, I cannot demonstrate it by chemical analysis. I would suggest that it is oxygen that is acquired from the atmosphere by time or age. In the process of curing or manufacturing substances for consumption or use, other gases are evolved, these in time are slowly given off, and oxygen is slowly and surely acquired instead. Chemists and geologists aver that three-fourths of this globe and its atmosphere is oxygen, if so, my hypothesis is a plausible one at least. If any one can furnish a better, I for one shall be willing to hear it.

Western New York, 1859.

DAINES' DRAIN-TILE FACTORY.

Mr. Moore:—I have just returned from a visit to the Drain-Tile Factory of Mr. JOHN DAINES, of Birmingham, Mich., a short description of which, I think would be interesting to your numerous Michigan subscribers and perhaps others.

At considerable expense and labor Mr. DAINES has been experimenting for several years, to produce a machine for making tile that should be simple in construction, durable and easily worked. He has been eminently successful in the production of one, perfect in all its parts, and for some months had one in operation, from which, by the labor of one man and two boys, he can make from one hundred to two hundred and fifty rods of tile per day, according to size, in a most perfect manner. The machine is made of cast iron, occupying a space of about eight feet by four, placed on wheels like car wheels, including a tender for holding clay. He has a drying house one hundred feet long and fifteen feet wide, with a good roof, and open on both sides and ends to admit a free circulation of air.

Through the center of this house there is laid a railroad track made of scantling. From the end of the drying house a track is extended into the kiln through the door-way, and another track to the Pug Mill where the clay is ground by the labor of one horse. The machine is placed upon the track at one end of the house, and is supplied by the tender with clay, being propelled by the labor of one man, with one boy to supply clay from the tender, and another to remove the tile from the machine to the shelves on both sides of the house. The machine is moved forward on the track as fast as one tier of shelves are filled. The tile, as soon as they dry, are placed upon a car and run into the kiln and packed for burning; the kiln holds tile enough for seven hundred rods of assorted sizes. There are dies for making three, four, and six inch horse-shoe tile, and dies for pipe tile which may be used in the machine and changed at pleasure.

The machine is simple in all its parts and perfect in all its operations and the tile manufactured of the first quality. Mr. DAINES is having manufactured under his supervision, machines which he furnishes to any part of the United States. The Pug Mill for grinding clay can be made by any good mechanic. Farmers have thus placed within their reach a portable tile machine which can be removed from one town to another where suitable clay is found and accommodate any number that may combine for the purpose—and furnishing themselves and others with tile at less cost, including the machine, than they could by transporting tile any considerable distance, and those having suitable clay will find their interest promoted by so doing.

Mr. DAINES deserves much praise for the perseverance manifested in bringing his machine to great perfection, and engaging in their manufacture, as well as tile to supply all demands, and I confidently hope he will be amply remunerated for his labor, and his exertions duly appreciated by the farmers and others who need either tile or machines.

S. B. NOBLE.

Pontiac, Mich., 1859.

ABOUT ROTATION OF CROPS.

SAYS H. T. B., in a late RURAL, "Plow less and seed down more." Now let me say, plow more and seed down more, also. That is, change from grass to grain, and vice versa, more frequently. That this would be more profitable than the usual way of seeding down a part of the land, and having the remainder continually under tillage, let me try and illustrate.

Most farmers must have observed that, as a general rule, the first crop of grass or grain is always the best, each succeeding one growing poorer; and as we cannot always remedy this by applying manure, I think it would be a safe rule for us never to have two grain or grass crops in succession—except where corn is planted, in which case use manure. Thus the land would be kept in much better condition, and freer from weeds. Of course, in this case clover would be the main variety of grass, the seed of which would be the greatest object, though the small kind will produce a pretty good crop for hay also. I find it will yield two and a half bushels to the acre, where it would be likely to give fifteen of wheat or forty of oats. Its failure of seeding well is mainly owing to the first crop not being cut early enough;—should always be off the land by the first of July, to insure the ripening of the seed.

When clover seed is sown, to insure its catching sow plaster also; it will be of the same benefit to the crop the next season. This is not believed by many, but is nevertheless a fact. I would further add, in behalf of the clover crop, that the saving of plowing, and its uses as a manure for the succeeding grain, will compensate a great ways for its occasional failures.

Now, brother farmers, please consider the subject; and if you are satisfied it will pay, why not act? I, for one, practice what I preach in this respect; have raised this last season more clover than grain—more money's worth to the acre, and grain not badly weevil-eaten either.

FALLOWING.—There are two ways whereby we can save a year's use of the land, and accomplish the same object. They have only been partially tried here, and I would solicit further information. First, to kill Canada Thistles.—Plow the land twice the same season, after a crop of barley. Secondly, with a crop of corn, cultivate and plow through the whole season.

Where can a good ditching plow be had?

Lodi, Seneca Co., N. Y.

H. VOORHIES.

How THE BEAN CLIMBS THE POLE.—Prof BREWER, of Washington College, Pa., gives, in the *Journal of Science and Arts*, the result of some experiments with climbing vines—the Hop, the Lima Bean, and the Morning Glory. He finds they will climb around a transparent glass pipe just as well as anything else, and that they are most ardent in their embraces when the pipe is warmer than the surrounding air. During the day, the vine is attracted toward the light, but at night, and especially on cool nights, it turns to the pole. He learned, also, that the color of the pole makes no difference; the changing instinct of the vine has to prepare itself against any shade. The element of continuity is very largely developed, the vine, after it has reached its pole, showing a much stronger tendency to wind around it than it did before to reach it.

OPERATION OF THE HYDRAULIC RAM ILLUSTRATED.

THE recent discussion on the value, uses and operation of the Hydraulic Ram,—elicited by previous inquiries in the RURAL,—has attracted considerable attention among our readers, indicating that the subject is regarded as one of no little importance. Within the past few weeks we have received several practical articles on the subject, but as our space is limited, and the matter was pretty fully discussed in the RURAL of April 2d, (and previous issues,) we defer their publication, for the present at least, and may omit them altogether. Meantime, we give the accompanying cut furnished us by Cowing & Co., of Seneca Falls, N. Y., who manufacture an Improved Hydraulic Ram. It is intended to illustrate the use of the Hydraulic Ram—representing one operated by the water from a spring near which it is located, and forcing the water through suitable leading or discharge pipe, to a considerable elevation, (either perpendicularly, or upon an inclined plane,) to a trough, which may be placed in any convenient locality for watering farm stock of every description, affording a constant supply of pure fresh water the year round.

As there is considerable inquiry for Rams, we would add that Cowing & Co., manufacture six different sizes, adapted to springs or brooks furnishing from 3 quarts to 30 gallons of water per minute. Their card will be found in our advertising department.

Condensed Correspondence.

Government Farming.

I AM sorry that the RURAL and some of its correspondents have so poor an opinion of the aid furnished them by the General Government.—Especially am I grieved that they so undervalue the precious volumes that annually emanate from the Patent Office. I have been so fortunate as to receive their latest Agricultural Report—for 1857—and I am only a plain farmer, though I did help to elect a Member of Congress. It has lain idle for some time, but since you and your Michigan friend have "had your say," I thought I would examine it a little. It is filled with exceedingly weighty matter. *Tea culture* is honored with 25 pages; *Sorghum canes* with 45, and *Meteorology* with 133. Who can complain of that? It commences with a resolution of the House of Representatives, that there be printed for the use of that body, 200,000 extra copies, and for the Patent Office, 10,000—and closes with a dissertation on the influence of the moon, accompanied by a table showing the moon's changes from 1776 to 1859 inclusive. Isn't all this of permanent national importance? Besides, printers must live—you know that, Mr. Editor—and if they can't get a living any other way, how convenient to have it furnished by Uncle Sam! We are informed that certain ones of olden time, when their craft was in danger, joined together as one man, to defend it. Printers seem to be less wise in this generation. Talk about these volumes being of no value. Why, not many years since, I attended an auction sale of the effects of an unfortunate printer in this section. He had a very good collection of Patent Office Reports in his library—Mechanical as well as Agricultural—all profusely illustrated, and they brought, cash down, from 8 to 12½ cents a copy—about their value for paperage. Surely, no one need complain that agricultural knowledge is not duly appreciated!—Pon-tiac, Wayne Co., N. Y., 1859.

Hemlock and White Cedar.

AN inquiry appears in a late number of the RURAL, from D. K. S., who wishes to know the comparative value of hemlock and white cedar for posts. I have been conversant with the two kinds of timber for twenty-five years or more, and in answer to his question, would beg leave to say that, if he wants posts for building, hemlock is better than cedar where it can be kept dry, as it will hold a nail much better than cedar. On the other hand, if he wishes the timber for fence posts, to put in the ground, the cedar will last much the longest. I have removed hemlock posts from the ground that were rotted off at the surface within five or six years from the time of setting, and have known white cedar to last well twenty years or more. The only drawback on the white cedar is that it does not hold a nail quite as well; but this may be obviated in part by putting up the fence with heavier nails.—STEPHEN SCHMERS, Livonia, 1859.

An Experiment.

THE following may prove of advantage to those who would like to raise good calves at a small expense. One of my cows came in the latter part of February, and as my winter stock of butter was running low, I wanted to make butter, and I also wanted to raise the calf, as it was of good stock. Here was a dilemma, for, if I raised the calf I wanted it well done. So I tried an experiment. I had some carrots boiled and mashed, and put a little in a milk, and the calf soon became fond of it. I increased the quantity of carrots, and decreased the quantity and quality of the milk, until we put in a little butter-milk, skim-milk, or sour-milk, the main feed being carrots, and the calf grows finely, and is fat.—B. C., Waterford, Pa.

Ashes for Potatoes.

RUFUS BROWN, of Chelsea, Orange Co., Yt., says that in an experiment tried by him, the gain in a crop of potatoes by the use of ashes at the rate of a teacupful to the hill, was about a bushel and a half of potatoes for each bushel of ashes used. The kind of potatoes was the English pink-eye, and yield 200 bushels per acre. The ground was planted May 7, with the ashes in holes, and a little dirt over them. It was plowed and hoed June 18, the rows being four feet apart and hills three feet. The ashes cost 12½ cts. a bushel, and potatoes sold at 35 cents, returning full 50 cents a bushel for the ashes employed.

An Experience with Carrots.

A CORRESPONDENT of the *Germanstown Telegraph* writes that paper as follows:—"I manured a piece of sod for this crop, plowed it in; after rolling, sowed about 200 pounds guano to the acre, harrowed it well, ridged slightly, then drilled in the seed. They did not come up well on account of too much wet at that time. One-half of the seed was of the yellow variety; the other was white. We are now harvesting them. The white ones are much easier taken up; as they grow out of the ground as well as in, they can be pulled with the hand. The yellow require a deep furrow drawn close to the row to get them out; the white will make nearly double the number of bushels, and for feed I think they are quite as good as the yellow."

Coal Ashes as Manure.

A CORRESPONDENT of the *New England Farmer* recommends the use of coal ashes for manure, and to prove their value gives an experiment made by an English farmer:—"The ground selected contained three perches of clover; the first had no manure, and produced thirty-eight pounds when cut in full head; the second, where four quarts of sifted coal ashes, which had not been exposed to the weather, were applied, the produce was fifty pounds; on the third perch, one quart of plaster was sown, and the crop weighed fifty-four pounds. It will be seen that the ashes increased the clover nearly one-quarter above that on which no manure was applied, which goes to prove that this substance is a valuable fertilizer." We never could find much benefit from coal ashes. In 1855 we tried them in growing pumpkins, and the more ashes the smaller the pumpkins. One vine grown on a heap of ashes about two feet thick, was a miniature plant, growing but about four feet in length, and producing pumpkins about the size of apples.

Composting Bones.

FOR a number of years I have had about a tun of coarse bones, and after trying various ways of applying them as manure, I settled down upon the following unscientific way for composting them:—"I first soften the bones with heated ley, until they can be crushed with a wooden beetle. After they are crushed, I mix well together one part bones and three parts wood ashes, slightly dampen the whole—then pile it up in a heap. The heap should be trod together very hard. After two days the heap should be mixed with ten or more times its bulk of peat or pond mud. I usually compost it in October, shovel once in November, and use to top-dress my corn-field the next spring. I have used it three years in succession, and it has paid the best of any manure I have ever used."

I am aware that many will condemn this way of composting bones on account of the waste of ammonia, but it seems to me that the wasted ammonia is more than compensated for in the increased value of what there is left. Bones and ashes prepared in this way, cause a pile of mud sixteen times their bulk to heat, and the bones will nearly all crumble to powder before the next spring. Says a correspondent of the *Country Gentleman*:

Agricultural Miscellany.

MICHIGAN PLASTER.—We are indebted to Mr. N. S. HAMMOND, of Clinton Co., Mich., for several excellent specimens of crystallized and granulated Gypsum, from the Grand River Valley. The specimens are very fine and beautiful.

SHEEP SHOW.—The Orleans Co. Ag. Society propose to have an Exhibition of Sheep, &c., about the 1st of June. By the way, what has become of the "Wool Growers' Association of Western New York," and when and where is to be its next annual exhibition?

THE TEST CREST EXPERIMENT, given in a late number of the RURAL, has called out several communications—mostly from believers in the theory that wheat turns to chaff. Several of these are anonymous, and hence inadmissible under our rule; and, as the others contain nothing original on the subject, we must decline again opening a useless and endless discussion. The experiment alluded to was called a "test" by the person proposing it, who fully believed in the transformation, and in the method by which it would be accomplished; that method was followed by himself and each of the Committee, and, as stated in Prof. DAWSON's report, proved an entire failure.

WOODEN WATER PIPE TESTED.—During the past two weeks several specimens of Wooden Water Pipe manufactured by I. S. HOBBS & Co., have been subjected to a series of tests, under the supervision of DANIEL MARSH, Esq., civil engineer, at the Novelty Works in this city. The apparatus used for determining the pressure was simple, but ingenious and accurate. The results (as given in an advertisement in this paper) are somewhat remarkable, showing much greater strength than we supposed wooden pipe possessed. We witnessed the testing of several pipes, of different sizes, and were surprised at the amount of pressure necessary to burst them. We have heretofore spoken of the durability of wooden pipe, when properly laid, and can now add our testimony as to its great strength, as indicated by the tests to which various specimens have been subjected. As strength and durability are the essential features in the use of water pipe we are constrained to state—and we do so without any solicitation—that the wooden tubing of our townsmen is worthy the special attention of all interested in "laying pipe."

THE BYRON AND BERGEN AG. SOCIETY, (Genesee Co.,) elected the following officers for 1859, at its Annual Meeting:—President—N. H. GREEN; Vice Presidents—F. S. Terry, John Green, Fred. Lowellen, E. F. Hubbard; Secretary—D. Hooper; Treasurer—J. A. Todd; Executive Committee—S. Richmond, Willis Bonham, A. T. Weeks, J. Harris, H. Reed, Benj. Child, W. P. Munger, Abner Hall, Jr., Wm. G. White, J. H. Crompton, and J. M. Bower.

A FARMERS' CLUB was organized in Harpersville, Broome Co., N. Y., last fall, for the purpose of discussing subjects of interest to Agriculturists and Horticulturists. The terms of membership were 25 cents per quarter—between thirty and forty members were enrolled—and the debates ably conducted and interesting. The officers are,—President—JAS. A. CHAYES; Vice-President—Albert Pratt; Secretary—O. D. Boeman; Treasurer—Almon Wasson. The Club has been the nucleus of forming the "Harpersville Agricultural Society," to include several towns. Officers of the Society for 1859:—President—MORRIS J. MUNDAY; Vice-President—Fred. H. Perry; Secretary—Wm. L. Mudge; Treasurer—B. G. Harper; Directors—Lewis Northrop, Geo. Collington, Ira B. Knox, W. Dusenbury, Platt Bishop, Wm. Doolittle, Jas. A. Chafee, John F. Bishop, Edwin Northrop, Levi Pratt, Harvey Munn, Geo. Wilcox, A. Everts, A. Wasson, J. H. Cole.

ABOUT MARKET FAIRS, AGAIN.—We have received from Mr. W. E. EDWARDS, an account of the Spring Fair of the "North Bloomfield Agricultural and Mechanical Exchange," held on the 7th inst., as already noticed. Mr. E. states that, notwithstanding the winter storms which prevailed for several days preceding and the hesitancy with which new projects are received, the large attendance, and the number and excellence of the animals on exhibition, was as gratifying as it was indicative of public sentiment. "As a show merely, it gave evidence of thrift and a generous outlay of means and care in producing a race of hardy, vigorous animals. But the main objects was not simply a strife for premiums; it was an assemblage of farmers and mechanics, with the proofs of their skill and industry beside them, for the purpose of instituting a Public Mart for the sale and exchange of property." Our correspondent then speaks of the advantages derivable from such Fairs, but gives no facts or figures as to the amount of sales—and we are really little wiser than before as to the result of the experiment. He also states that the Association proposes to institute sales at auction—that it was fortunate in the selection of a location for its Fairs and Meetings, and that the next one will be held on the 30th of June, "when, its plans being better perfected, an opportunity will be offered for demonstrative proof of the benefits resulting therefrom." We do not concur in the concluding sentiment expressed by Mr. E., as follows:—"It seems that Market Fairs must ultimately supersede the present order of County Associations, inasmuch as they offer a wider and more congenial field for the exercise of these business characteristics peculiar to the necessities of the laboring classes. Let the farmer and mechanic ponder these things, and give them a trial." We think it may be well, as we have previously suggested, for County and other Ag. Societies, to try Market Fairs in the Spring, and make sales a feature of their regular Annual Exhibitions, (as some do already,) but we are far from believing that the former "will ultimately supersede" the latter. Market Fairs are still in the crystal or experimental stage in this country.

FISH CULTURE.—A remarkable account has been lately given by Dr. CLOUET, to the Paris Society of Acclimation, of the results of an attempt to keep salmon in fresh water ponds having no communication with the sea. The experiment was made at St. Cloud, near St. Cloud, where M. COSTE has successfully carried on piscicultural operations on a very extensive scale. The pond chosen for the experiment in question is of small extent, and is supplied by a small stream of fresh water, sufficient to form a cascade. Three years ago the pond was entirely emptied and cleaned out. In April and May 1855, several thousand salmon only two months old, were placed in the pond with trout, and, notwithstanding the voracious nature of the latter fish, the salmon have prospered so well that a few weeks ago, in the presence of the Emperor, who takes great interest in the artificial production of fish, no less than 800 kilogrammes weight of salmon was caught by one haul of a net. This result is very surprising, but M. COSTE states that he was far more astonished to find that the female salmon were full of eggs. He adds that he saw several eggs so highly developed that they were on the point of being emitted. These results, which bear the stamp of high authenticity, prove that salmon may be produced and reared in fresh water ponds, under similar circumstances to those by which trout are now so successfully supplied in various waters around Paris.—Selected.

HORTICULTURAL

THE APPLE TREE BORER.—I see the *RURAL* is truly the farmer's friend. Allow me to make an inquiry. Some years since I set out an orchard of which I thought not a little. It has commenced rewarding my labor, but I have discovered during the past winter and the present spring that an enemy was at work on my trees. What it is I know not. From the roots upward, from six inches to two feet, it looks as if it would take a knife and prick the bark parallel with the tree. There are holes as though a worm had eaten through the bark and sap wood, then eaten up and down two or three inches more, and then eaten out the pulverized wood remaining in the hole caused by the worm. My apple trees are all affected, except one, which the mice nearly destroyed when they made such ravages among fruit trees. That tree appears to be healthy, but all the rest are injured. My orchard is on dry land, being on the east side of a ridge of land running north and south, which is not springy. Part of it is gravel land, subsoil, same; some is sandy, subsoil, same; and some is clay. The trees on the clay are the most injured; those on the sand next; those on the gravel the least affected. The land was subsoiled when the trees were planted. My cherry and peach trees appear to be free from injury. There is no other young orchard in the neighborhood where I live. Will you, or some of your numerous correspondents, tell me the cause and cure, if any? Can my apple trees be saved? I trim them yearly. I have raised corn and potatoes in my orchard, but it has been seeded to clover two years. Last fall I plowed and sowed to wheat, which looks fine. I put manure all over the lot previous to plowing. I think the land has been in good heart ever since I set my orchard. I would like to hear an opinion of my case. My trees are grafted fruit, purchased of ELLWANGER & BARRY, W. H. West Bush, N. Y., 1890.

The insect that injured the apple trees was, undoubtedly, the *Apple Tree Borer*, and it is one of the worst enemies against which our apple trees have to contend. It is quite common throughout the country, and the injury it does is often charged to an unsuitableness of soil or climate, or the nurseryman is blamed for selling unhealthy trees. The egg which produces the borer, is laid by a winged insect which makes its appearance every season in June, and flies only in the night. During June and July, the female beetle deposits her eggs, one at a place, upon the bark, generally where it is tender, near the surface of the earth. Sometimes, when they are very numerous, they deposit eggs higher up, particularly in the crotches formed by the lower limbs. From each of these eggs is hatched a small maggot, of a white color, with a yellow tinge to its head. This maggot eats its way directly downwards in the bark, producing a discolored where it is situated. If the outer dark colored surface of the bark be scraped off with a knife, the last of August or fore part of September, so as to expose the clean white bark beneath, as can easily be done without any injury to the tree, wherever there is a young worm it can readily be detected. A little blackish spot, rather larger than a kernel of wheat, will be discovered wherever an egg has been deposited, and by cutting slightly into the bark the worm will be found. It gradually works its way onwards through the bark, increasing in size as it advances, until it reaches the sap-wood; here it takes up its abode, feeding upon and consuming the soft wood, thereby forming a smooth, round, flat cavity, the size of a dollar or larger, immediately under the bark. It keeps its burrow clean by pushing its excrement out of a small crevice or opening through the bark, which it makes at the lower part of its burrow, and if this orifice becomes clogged up it opens another. This excrement resembles new fine saw-dust, and enables us readily to detect the presence of the worm by the little heap of this substance which is accumulated on the ground, commonly covering the hole out of which it is extruded, and by particles of it which adhere around the orifice where it is higher up, or in the fork of the tree; the outer surface of the bark also often becomes slightly depressed, or flattened, over this cavity.

For a more full description of this insect and its operation, we must refer to the *RURAL* of January 5th, 1888.

The most efficient enemy of these borers is the common wood-pecker, so frequently seen in our orchards. They should never be molested in their work. Various experiments for killing the worm have been proposed, such as plugging up the hole, thrusting a wire into it, &c., but the nature of the burrow which we have described, makes this very difficult. Perhaps there is no better way of destroying the insect than by cutting him out with a strong knife. The wounds thus made will generally heal readily, and it is much better than to allow the insect to continue in his course of mischief. Fitch recommends that the course of the burrow be ascertained by puncturing the bark with an awl, and then the bark at the top be cut away, so that scalding water can be poured from a teapot or other vessel into the burrow, which will kill the varmint.

As a preventive, washing the bark with strong lye, in August, when the newly hatched grubs are but slightly sunk in the bark, is useful.

In a late number of the *RURAL*, Hon. A. B. Dickinson recommended the placing of soft soap in the crotch of the tree for this and other insects. We think well of this plan, for soft soap, and in fact all alkaline substances are offensive to insects, and as the soap would be constantly washed down the trunk by rains, we think great advantage would result from this course. In conversation with CHAS. DOWNING and Dr. GRANT, some time since, these gentlemen recommended to us the making of wooden boxes around the trunks of orchard trees, as a sure defence against the borer as well as mice.

ACKNOWLEDGMENTS.—We are indebted to many friends for Catalogues, &c.—to B. K. BLISS, of Springfield, Mass., for a package of his newest Flower Seeds, which we design shall bloom at our flower stand this season; to E. D. HARTCOCK, Seedman of this city, for a fine collection of his best Vegetable Seeds, which will speak well for themselves in a month or two, we have no doubt.

FRUIT FOR CERTAIN LOCALITIES.

MESSENGER.—I have no doubt that the Fruit Growers' Society of Western New York was organized, its object was to disseminate knowledge to fruit growers. This has doubtless been accomplished in a good degree, but could not this Society be more useful to the public generally, if it would recommend a list of fruit similar to the one recommended by the American Pomological Society, with this exception, that the list should be for Western New York only, while the American Pomological Society recommended one for the United States? Now, it is evident that many fruits that succeed well in one locality, are worthless, or nearly so, in another. For instance, the *Burred Aremberg Pear* is recommended by the American Pomological Society for general cultivation. In this section it is worthless, or has proved so with me. Let us examine some of the lists of apples recommended by some of the Western States. We will commence with Ohio. The Cincinnati Horticultural Society furnishes the following list of apples for the vicinity of Cincinnati, Ohio:

For Ohio.—Best Six Varieties.—Red Astrachan, Benoni, Maiden's Blush, White Pippin, Winesap, Rawle's Janet.

MICHIGAN.—Best Six Varieties.—Early Harvest, Late Strawberry, Gravenstein, Belmont, Yellow Bellflower, Esopus Spitzenburgh.

ILLINOIS.—Best Six Varieties.—Red June, Summer Pennock, Snow, Domine, Wagener, Willow Twig.

WESTERN NEW YORK.—The following kinds received the highest vote at the meeting of the Fruit Growers' Society at Rochester in January last:—Baldwin, Rhode Island Greening, Roxbury Russet, King, (of Tompkins County,) Northern Spy, Twenty Ounce.

From the above list of apples from four States, six each, we have in the aggregate twenty-four kinds;—no two States recommending the same apple. Mr. BATEMAN, of Ohio, at the American Pomological Society's meeting in New York, said many of the apples recommended on the list for general culture, were not adapted to a great portion of the country, particularly the West, and that planters were misled by it. Many of the winter sorts fail entirely in the West. Seven or eight varieties should be stricken from the list for general culture, and placed in the one for certain localities. It appears that certain fruits well adapted to New England States, do not succeed well here, and that some of our best fruits are worthless at the West. This being the case, is it not highly important that we have a list of fruits adapted to Western New York? and what Society is better qualified for this important work than the *Fruit Growers of Western New York*. I throw out these hints, in hopes to hear from others on this important subject. Greece, N. Y., April, 1889. J. S. CLARKE.

TAKE CARE OF THE ORCHARD.

MESSENGER.—Among the numerous things to be done upon the farm during the busy season of spring, is the necessary care of orchards. The raising of fruit successfully requires care like any other crop upon the farm. Too many farmers neglect this important branch of husbandry, and consequently reap the reward of such care, (poor crops of poor quality,) while by extending needful care, no other portion of the farm pays better, besides the luxuries gained. If your orchards are not grafted do not let April and May pass away without seeing that every tree which bears poor fruit is grafted with the most approved kinds; draw manure to the roots of the trees. If they are old, or not in a thriving condition, scrape the bark with a sharp hoe, wash them with lye, give them sufficient pruning, cut the limbs close down so that they can heal over, and your orchards will amply remunerate you for all your trouble and expense, and make its owners proud of that property which previous to such care was comparatively worthless. Farmers, if you consult your interest as well as pride and fancy in this matter, you cannot fail to extend a portion of your time to so important an object. Land can hardly be cropped to better advantage than that of the production of the best fruit. Make your orchards your hog pasture. The hogs will destroy those worthless, wormy apples which fall from the trees before maturity, and also work among the roots of the trees, which is much better than plowing.

If wood-peckers attack your trees, spread grafting wax over the wounded parts, and they will cease from troubling them. Grafting wax is composed of five or six parts rosin, one part beeswax, and one part tallow, melted together and thoroughly stirred till cool. A good selection of fruit is as follows:

For early use, Early Harvest, Sweet Bough, Washington, Golden Sweeting, Ladies Blush, Cabanabee, Detroit Red, Autumn Bough, &c.

For winter use, Holland Pippin, Gilliflower, Ribstone Pippin, Peck's Pleasant, Seeknothfurther, Rhode Island Greening, Esopus Spitzenburgh, English Russet, Baldwin, Swaar, Yellow Bellefleur, Roxbury Russet, Tallmon Sweeting, and Northern Spy.

NATHAN SHOTWELL, Elba, Genesee Co., N. Y., 1889.

BARTLETT PEAR ON GRAVELLY SOIL, &c.—Will the Bartlett Pear do well on gravelly land if made very rich? I want to set out two grape vines. Now, which would you advise, the Delaware, Diana, Hartford Prolific, or Northern Muscadine? I want the best two of these four. Please answer a great admirer of your valuable paper. I have the Concord grape; it is good. And I have the Isabella; it winter-kills, and when it does not it will not ripen before frost. I know of quite a number of vines in Suffolk, but not of one that will ripen their fruit.—R. J. SUFFIELD, Hartford Co., Ct., 1889.

THE BARTLETT PEAR, on its own roots, we think would succeed well on a gravelly soil. We have seen it flourishing under such circumstances, and also on a very sandy loam. On such soil, however, manure must be freely applied. This, if well-rotted, may be forked in, but if fresh, should be laid on the surface for a season, as a mulch, and then dug in. Old, rotten turf would make a superb dressing for such soils. Of the varieties of grapes mentioned, our choice would be Delaware and Hartford Prolific for your locality. Both would ripen, and we have no doubt would prove entirely hardy.

HARDY FLOWERING SHRUBS.

No class of plants or trees are more useful than the *Hardy Flowering Shrubs*. Beautiful both in foliage and flower, growing with even less care than a currant bush should receive, they recommend themselves alike by their value and ease of culture to all lovers of the garden. Among them are numbered those old favorites, the *Lilac*, the *Snow Ball* and *Syringa*, and those exceedingly interesting families, the *Spiraea* and *Thorn*. With annual and herbaceous flowers, skill and care is necessary to prevent the ground from being bare a part of the year, which is always unsightly in a flower garden; and trees require a long time to obtain sufficient growth to afford shade or to please the eye with their beauty. In a year or two, however, the hardy shrubs are in perfection,—they commence blooming with the first dawn of spring, when the *Daphne*,

"Though leafless, well attired and thick beset
With blushing wreaths, investing every spray,"
delights the lovers of flowers; and the frosts of autumn find the garden gay with the charming *Althea*.

FIGURE 1.—DAPHNE MEZEREUM IN FLOWER.

No fanciful arrangement of flower beds, even with nicely kept gravel walks and borders of box, is so neat and tasteful for the garden immediately in front of the house or around it, as a well kept plot of grass or lawn, with a few flowering shrubs in groups, particularly around the edges, and so arranged as to hide the fences and all unsightly objects. By a skillful arrangement of the shrubs a lawn fifty or a hundred feet square may be made to appear much larger than its real size.

FIG. 2.—DAPHNE MEZEREUM, LEAVES AND BERRIES.

THE *DAPHNE MEZEREUM*, or *Pink Mezereum*, is one of our prettiest very early flowering shrubs, and grows about four feet high. The pink flowers appear before the leaves, in clusters all around the shoots of the previous year, as shown in the engraving—fig. 1. The flowers are followed by beautiful brilliant scarlet berries, the size and appearance of which are shown in the engraving, (fig. 2,) so that the plant is as showy when covered with berries as when in blossom. It flowers early in April, its blossoms are sweet scented, and it is in all respects desirable, and worthy a place in every collection of shrubs. The *Daphne* thrives well in any good dry soil, but dislikes a wet position, and will soon show its dislike by becoming stunted and mossy. The fall would be the best time for transplanting but those that plant in the spring should do so as early as possible.

PRUNING THE VINE.

EDS. RURAL:—Much has been written for your paper in regard to the cultivation of Grapes, and also the manner of pruning the vine, all of which I read with pleasure, as I am considerably interested in that branch of Horticulture. Of course I cannot subscribe to it all. Who could? A few days since I received the *California Cultivator*, published at San Francisco, which gives my views of pruning the vine, much better than anything else which I have read, a part of which I will give you for the benefit of your many readers.

"The proper pruning of the grape vine is a subject upon which a great diversity of opinion has ever existed, and yet there are certain general features or rules pertaining to the art of vine-dressing, that are to a great extent common to every system.—Pruning the vine is a very different process from cutting in or shortening the fruit-bearing shoots, and yet there are those who know, or make, no distinction between pruning the vine at a proper season, in order to produce fruitfulness, and a recommendation to be cautious how you cut back the bearing shoots of your grape vines, with a view of increasing the size of the fruit. A prevention of the elongation of a bearing shoot, and cutting it back, are two different things. The proper season

for pruning the vine, with a view of securing its fruitfulness, commences about the first of November, or immediately after the leaves drop in the fall, and can be continued at convenience for three or four months. Cutting in, as injudiciously practiced by some, is usually performed when the fruit is swelling. With this process, then, we have, at this season of the year, nothing to do but record our protest against the practice, based upon our own personal experience for years, as well in the Western States as in California, and this experience is endorsed by the oldest culturist of this State, and in a section that produces the largest and best grapes that have ever yet appeared in the market of San Francisco. All cultivators of the vine admit the necessity of an annual pruning. It is this that gives to the cultivated vine a productiveness over the uncultivated wild grape vines, indigenous to our mountain gulches and ravines, for it is a well known fact that such wild vines subjected to a proper winter pruning are rendered fruitful, and this without any after cutting-in, or shortening of the fruit-bearing branches, at the season of the swelling of the fruit. The proper mode, then, of pruning the vine to secure fruitfulness as well as a vigorous, healthy growth, is one of the first importance to the vine-grower. Every day's experience is teaching the observant grape culturist the utter fallacy and error of being unchangeably wedded to the old system of pruning, or of supposing that because entirely applicable to other countries, the same must necessarily be here.

We are entirely opposed to the system of close (summer) pruning so rigidly adhered to, even in this country of heat and sunshine, by most of our culturists with a European experience. This class of culturists grow grapes here, and often very good ones, but seldom equalling those grown under a less rigid system of (summer) pruning.

The Hon. A. G. SIMMS, of Florida, an amateur culturist of grapes, says,—"I train my vines on trellis or wire, but cannot follow the rigid system of pruning recommended in European culture, and practiced at the north. We have to so train our vines that not a ray of sunshine ever touches the fruit, otherwise the fruit loses much of its fine flavor, and is altogether robbed of its bloom. It is all-important that the grape be entirely shaded at every stage of its growth and maturity. The natural shade and protection of the fruit is its foliage, and the more luxuriant this is, the greater certainty of fruit of large size and rich flavor."

J. FISK ALLEN, in his treatise on the culture of the grape, says:—"It is the established opinion in vineyard culture, that the best fruit is produced when the vine receives the most sun—not upon the fruit, but upon the foliage." H. W. S. CLEVELAND, of Burlington, N. J., cultivates an extensive vineyard, and is increasing it largely. He says:—"Formerly I used to be careful of my summer pruning, but after experiment I was convinced that the vines are best left alone; that all the leaves are needed for ripening the fruit."

Dr. SIDNEY WELLES, of North Carolina, in an article originally written for *Dr. Bow's Commercial Review*, also says:—"The principle of allowing the vine to spread and range during summer, is undoubtedly correct." And, J. FISK ALLEN, as good authority as we have in the United States, says:—"It is what I have recommended for many years."

From my own experience for the past three years in the cultivation of the grape and the summer pruning of the vine, I think the above is nearer right than anything I have before seen. In 1886 I had 100 vines which came into bearing, and not knowing very well how to summer prune, I solicited information from quite a number, and from such information as I received, I commenced cutting in at from two to four joints beyond the fruit, as is now recommended by some; but before I finished, a man came into my vineyard, when a discussion was commenced as to the advantages and disadvantages of such a system of pruning, which resulted in my leaving one row of eight vines, from which I pinched the terminal bud on the bearing shoots, simply checking the growth, and watched for the result. In the fall I was perfectly satisfied that the grapes on that row were better than on the others, though not as to the cause, as I recollected that I had given the ground about that row a coating of leached ashes, which the others did not have.

In 1887, I tried another experiment. I cut off all the bearing shoots four joints beyond the fruit, and on one row I let all the laterals grow. On the others, the laterals were kept trimmed back, as is now recommended. In the fall I saw a decided difference in favor of the one row which had the most foliage. The grapes were larger, earlier, and of finer flavor. In 1888, some of my vines I cut in considerably, others but little, and the rest not any, except to pinch the terminal bud, and remove branches where I thought them too thick, as I did on all my vines. I am now perfectly satisfied that the cutting-in is a decided injury to the fruit. I shall thin out the branches where too thick, and where two or three branches come from one spur take off all but one. Last fall I purchased the fruit from six different vineyards; none of them had been pruned to excess, some not any, and some thinned out and the bearing branches allowed to grow, and the quality of the fruit from those vineyards goes to sustain me in the system I have adopted. F. B. PECK.

East Bloomfield, N. Y., March, 1889.

THE KING GRAPE.

MESSENGER.—I wish to call the attention of your readers, now that the new grapes are creating so much excitement, to the *King Grape*. It is a white grape, and a seedling, perfectly hardy, in every respect, early, and originated in the garden of ROBERT WENZEL, of this city. The vine came up from self-sown seed, among some currant and gooseberry bushes, and remained where it came up until it bore fruit. Mr. WENZEL has the *Clinton*, *Sweetwater*, and a number of other varieties growing in his garden, and is in the habit of making wine and throwing the seeds into the garden. From this seed it is supposed this grape originated. It bore for the first time in 1887, when the vine was three years old. In the summer of 1888, Mr. W. called my attention to it, when it was in fruit, and I then made an arrangement to take the vine

into my hands, for propagation and sale on shares, with the privilege of naming it. In the fall I exhibited the fruit before the *Fruit Growers' Society* of Rochester, N. Y., and the Committee on Native Products and the Horticultural Society of Rochester, N. Y., and the Committee on Native Products of the *King Grape*. The vine grew in a poor, damp soil, among currant and gooseberry bushes, and shaded by trees and vines, and without pruning. The fruit, of course, was not what it would have been under more favorable circumstances, but I have taken care of it the present season, and hope to show fair specimens this summer. Rochester, N. Y., April, 1889. WILLIAM KING.

STONES UNDER FRUIT TREES.

The above caption in your issue of April 9th, served to remind me of an occurrence confirmatory of "H. S.'s" article. While on a visit at Cape Cod, a year or two since, my attention was called to an orchard of apple trees. The owner was a retired sea captain, who, in early life, planted the trees, that he might eat of the fruit when on the "retired list." At the time of planting out the trees, he secured the services of an old Scotch gardener. The trees were heeled in, the location for planting staked out and then came the instructions of the owner, as he was obliged to absent himself for awhile.

"If it takes you two days to plant each tree, I wish it well done." The gardener went to work, digging large holes, sufficient to dump in loads of stones from a tip-cart, and on the return of the proprietor he had only set out four trees. Though he had done his work well, as the sequel will show, the captain thought he had played "soldier," and discharged him. The balance were set out as trees sometimes are (where the blame is laid to the nurserymen), and now, after forty years, those four trees give more fruit than all the remainder. Dedham, Mass., 1889. E. W.

A BATCH OF CAKES.

EDS. RURAL:—Inclosed please find a few recipes, which I trust may be worthy of publication:

DELICATE CAKE.—Take the whites of 16 eggs; 1 lb. of flour; 1 lb. of pulverized sugar; 3/4 lb. butter; 1 tablespoon vanilla; 1 teaspoon cream tartar; 1/4 teaspoon soda. Cream the butter and sugar together, and put in the eggs with the flour. This will make a large cake.

SPONGE CAKE.—Two tumblers of pulverized sugar; 2 do. of flour; 10 eggs. Beat the yolks with the sugar, then beat the whites to a stiff froth, and turn in with the flour.

FRUIT CAKE.—One lb. of sugar; 1 of butter; 1 of flour; 10 eggs; 2 lbs. currants; 8 lbs. raisins; 1/2 oz. mace; 1/4 lb. citron; 1/2 teacup brandy; 1 teacup molasses.

CUP CAKE.—One cup of sugar; 1 cup butter; 2 1/2 cups flour; 4 eggs; 1/2 cup buttermilk; 1/2 teaspoon saleratus. Add a few raisins.

COOKIES.—Four eggs; 1 cup of butter; 2 cups of sugar; 2 teaspoons of saleratus; a little nutmeg; flour enough to roll. Bake in a quick oven.

FRIED CAKES.—One cup of sugar; 1/4 cup of lard; 1 teaspoon of salt mixed with the flour; 1 qt. buttermilk; 1 tablespoon saleratus; 2 eggs. Cinnamon or spice to your taste.

CORN STARCH PUDDING.—One quart of milk; 5 teaspoons of starch wet up in milk; 8 eggs beat up and stirred in with the starch, and then stirred into the milk, boiling. Cook three minutes. Side Hill, North East, 1889. PROCTER A.

AN INQUIRY.—I would like to make a few inquiries through the columns of my esteemed visitor—the *RURAL*. Will some one please inform me what is Madder Compound? It is spoken of in several of the coloring recipes. I do not know, nor mother, and she is a very old lady, and has dyed often. I also noticed an inquiry for a good cement to mend glass or china, but have not seen it answered. Will some of the wise ones please answer and oblige?—Miss L., Porter Village, Mich., 1889.

A POULTICE FOR FELONS, &c.—Take Castile soap and scrape a large or small quantity, according to the amount wanted, and simmer in new milk till it forms a paste as thick as cream, cool and apply. You will find this one of the best poultices for felons, or any kind of swelling that needs poulticing, and far superior to bread and milk. Try it, ye afflicted.—Miss L., Brick Cottage, Mich., 1889.

TO PRESERVE FURS.—My better half wishes to inform the friends of the *RURAL* that she has kept her furs perfectly safe through seventeen summers, simply by putting them into a tight linen bag, tying up tight and hanging up in some dark, dry closet. Those who put up their furs safe in May will find them safe in November.—A. CHOATE, Perrytown, C. W., 1889.

A REMEDY FOR BRONCHITIS.—Having seen it stated that dried mullein leaves smoked in a common pipe would cure bronchitis, my wife concluded to test the matter, and after a few months' use she thinks she is cured.—A. S. COOKS, Loganport, Ind., 1889.

INFORMATION WANTED.—My wife wishes to inquire of some one who has had experience how to make soft or hard soap from potash. BABBETT's directions are on cans, but she does not succeed very well with them.—O. Racine, Wis., 1889.

WOOD ASHES and common salt, wet with water will stop the cracks of a stove; and prevent the smoke from escaping.

GREEN should be the prevailing color of bed-hanging and window drapery.

THE MINIATURE.

BY G. F. MOORE.

WILLIAM was holding in his hand
The likeness of his wife;
Fresh as if touched by fairy wand,
With beauty, grace and life.
He almost thought it spoke—he gazed
Upon the treasure still,
Absorbed, delighted, and amazed
To view the artist's skill.

"This picture is yourself, dear Jane,
The drawn to nature true;
I've kissed it o'er and o'er again,
It is as much like you."
"And has it kissed you back, my dear?"
"Why—no—my love," said he,
"Then, William, it is very clear
That not at all like me!"

Written for Moore's Rural New-Yorker.
SYMPATHY.

Like the Night-blooming flower
That its fragrance sends forth,
When darkness o'er shadows
All the bright things of earth;
So is SYMPATHY pure
In life's suffering hours;
So sweet and so grateful,
Like the fragrance of flowers.

Written for Moore's Rural New-Yorker.
LOSS AND GAIN.

BY EMILY C. HUNTINGTON.

I THINK I felt unusually complacent as I put the last touches to my toilet, and started on that shopping expedition. I remember a passing reflection, as I put my little portmanteau in my pocket, that it was probably better filled than many a more pretentious one; not heavy enough to be at all burdensome, but just enough to carry comfortably through the streets without suggesting pick-pockets. Every lady knows how time flies when one is shopping; and amid the endless variety and tempting patterns of the furniture rooms, my brain was sorely puzzled—but a choice was made at last, and already I saw in imagination my pleasant parlor adorned by the pretty sofa and graceful chairs, when chancing to put my hand in my pocket, I found it empty.

There was a moment of stupid bewilderment, and then the conviction came with all its length and breadth to my mind—my money was gone. Dropped on the street, no doubt, and as hopelessly lost as if in the bottom of the Red Sea, with the loose change PHARAOH may have had about him.

I have a thermometer usually with me called *Self-Complacency*, and some plain-spoken friends of mine have assured me that it generally indicates a high temperature, but I can confidently assert that at this time the mercury was below zero. Have you ever seen on an icy day an elegant specimen of the genus homo, flourishing his dandy cane along the walk with an air of intense satisfaction, and just as he was preparing for an exquisite recognition of some belle of the promenade, do you remember how the treacherous ice glided from under his tread, and the next glimpse you had impressed on your memory a promiscuous mixture of boot soles, broadcloth, small cane, eye-glass and dandy? With what a crest-fallen look the poor fellow gathered himself up and crept away. You could not help pitying him, laughing all the time. I laughed at just such a sight last Sabbath, when I ought to have been meditating on the sermon, but if two persons ever have precisely similar sensations, I shared his feelings so fully, as I slowly turned my face homeward, that I hardly knew whether it was the collapsed dandy or my proper self.

Well, the money was gone. That was, as J— used to say, "a true fact"—so calling to my aid all my stock of philosophy, strengthened by sundry wise saws, I sat down by the fire to meditate. If I could only know who would find it—and then I fell to dreaming over the chances; and pictures presented themselves to me in this wise:—A garret in an obscure corner of the city, with the sky peering in through the yawning roof, and a little fire smouldering on the hearth. Drawn close to it a rickety chair, and a pale woman, wasted with want and pain, reaching out her thin hands toward the feeble warmth. By the window a young girl bending wearily over her needle, with a hopeless look in her sad face. There is neither food nor fuel in the room, and the scanty pay that will be given for the garment in her hands is all her hope of escaping a little longer from the grasp of cold and hunger. It is finished at last, and the girl hastily rises, puts on a thin shawl and faded bonnet, and with a loving word to the invalid mother goes out into the street.

How merrily the world seems to go! Ladies wrapped in costly furs are whirled by in sleighs, to the music of the bells, or trip gaily along the walk, sweeping past the poor little seamstress without a glance or a pitying thought. She, poor shivering thing, draws her shawl more closely about her, and plods along to the shop with her work. The well-dressed clerk takes it carefully from her hand, inspects the sewing, and tosses it one side. "You will have to come on Saturday for your pay," he says; "we have deferred upon weekly payments," and turns away. No view of the girl's disappointed face, and the stony look that came into her eyes as she crept trembling out of the shop, haunted him as he sat down that night amid all the outward blessings of life. Oh, no! he was used to it—it never troubled him now. I took up the poker and stirred the fire with a vindictive feeling for a moment, then leaned back in my chair and dreamed on. Once on the street the girl walks mechanically homeward for a few moments. There is no much blind despair in her heart that there is no room left in it for any faith in God's pity or man's hu-

manity. "We may as well die now as any time—we must starve in the end—there is no room in the world for us," and she turns a bitter, fierce look upon the merry pedestrians, that jostle her as they pass. If a dim thought of the promises on which her mother has always leaned in her sorest need, comes into her mind, it is too faint a light to make any show in such great darkness. We have all seen such times of sore temptation, but God knows our human weakness and unbelief, and will not condemn us unmercifully. What is that lying at her feet? Her fingers tremble with eagerness as she grasps the treasure, opens it and examines the contents. It is a lady's portmanteau, and contains what seems to her, so long fighting with poverty, a great sum. Visions of comfort and happiness, such as she had not known for years, rise up quickly before her. Food and clothing, fuel, and medicines for her sick mother, little delicacies that her failing appetite craved—all these the purse would supply. Then came another thought,—the money was not hers. Where was the owner?—She dares not think of it, but hurries home to the garret, and tells the whole story to her mother.

"I think the Lord sent it to us, mother, to keep us from starving, and I think it would be right to use it. We can never find the owner?"

"Perhaps not, my child, but we must do what we can. You had better go and tell Mr. C— about it, and ask him to let me know if anybody should advertise for it. We will wait a week and then I think it will be fairly ours."

"And how are we to live in the meantime? we shall die of starvation."

"I believe there will be some way provided; the Lord never leaves us utterly to perish, but if we die let us die in our integrity."

"I hope they will use the money," said I, starting from my chair—"the Lord sometimes forces our tardy charities from us, and makes us his almoners against our will."

The tea-bell was ringing, my brother came in from his study, and seated at the table I told him of my misfortune.

"Had I better advertise it?" I asked him.

"It is hardly worth while. If an honest person finds it he will advertise, and if any one else has it, your advertisement would do no good."

"Well, I hope some one who needs it will find it, and I believe it will be so," said I; and I had half a mind to tell him about the sewing girl and her mother, but his face looked so unpromisingly practical that I forbore.

"Most likely," said he, "it will supply some son of Erio with the 'drop o'gin,' and the 'bit o'tobacco' for the rest of the winter."

The suggestion made me indignant, and I poured my tea in silence; but I have gone back to my first fancy, and hope soon to see it fully confirmed.

Brooklyn, Conn., April, 1850.

MOTHERS.

If anything in life deserves to be considered as at once the exquisite bliss and pre-eminently duty of a mother, it is this—to watch the dawning disposition and capacity of a favorite child; to discover the earliest buds of thought; to feed with useful truths the inquisitiveness of a young and curious mind; to direct the eyes, yet unsullied with the waters of contrition, to a bounteous Benefactor; to lift the little hands, yet unstained with vice, in prayer to their Father which art in Heaven. But so it is; the child, as soon as it is released from the bondage of the nurse, and needs no longer a careful eye to look after its steps, and guard it from external injury, is too often surrendered to instructors, some of whom are employed to polish the surface of the character, and regulate the motions of the limbs; others to furnish the memory, and accomplish the imagination; while religion gets admission as she can—sometimes in aid of authority, and sometimes in a Saturday's task, or a Sunday's peculiarity, but how rarely as a sentiment! Their little hearts are made to flutter with vanity, encouraged to pant with emulation, persuaded to contract with parsimony, allowed to glow with revenge, or reduced to absolute numbness, by worldliness and cares, before they have ever felt a sentiment of devotion, or beat with a pulsation of sorrow for an offense, or gratitude for a benefit in the presence of God. Believe me, mothers, you have no right to expect that the sense of religion will be infused by the labors of others. When parents have ceased to be teachers, religion has ceased to be taught.—*Selected.*

EVENING BEFORE A WEDDING.

"I will tell you," continued her aunt to Louise, "two things which I have fully proved. The first will go far towards preventing the possibility of any discord after marriage; the second is the best and surest preservative of feminine character."

"Tell me!" said Louise anxiously.

"The first is this—to demand of your bridegroom, as soon as the marriage ceremony is over, a solemn vow, and promise yourself, never, even in jest, to dispute, or express any disagreement—I tell you never!—for what begins in mere bantering, will lead to serious earnest. Avoid expressing any irritation at one another's words. Mutual forbearance is the one great secret of domestic happiness. If you have erred, confess it freely, even if confession costs you some tears. Further, promise faithfully and solemnly never, upon any pretext or excuse, to have any secrets or concealments from each other; but to keep your private affairs from father, mother, sister, brother, relations, and the world. Let them be known only to each other and your God. Remember that any third person admitted into your confidence becomes a party to stand between you, and will naturally side with one or the other. Promise to avoid this, and renew the vow upon every temptation. It will preserve that perfect confidence, that union, which will indeed make you one. O, if the newly married would but practice this spring of connubial peace, how many unions would be happy which are now miserable.—*Frederick Schuler.*

I sorrow that all the fair things must decay.—*Mrs. Hemans.*

Misery conquers and subdues opposition, courage defies and overcomes it.

THE MARINER.

BY MINERVA OSBORN.

Along the banks of life's little stream
Sails a child in his winsome glee,
Keeping time to the ripples' roguish play
As they kiss the pebbles on their way.
Their way to the far-off sea.

Now he talks to the flowers along the brook,
Then he sings some childish song;
He watches the stars as they bend to look
At their sister stars in the lowly brook.
He had always thought they were very high,
Far up in the roof of the sheltering sky;
He smiles to see them so near him now,
Glistening and gleaming just under his prow,
As he lightly skims along.

But the stream flows on with a swifter course,
And the child hath ceased his lay;
O'er the hurrying wave his bark he guides,
Nor needs the flowers by the river's side,
For he sees beyond a broader stream
When along the shore
Lies the glittering ore,
And precious gems in the sunlight gleam.

Then an Angel comes to the mariner child,
"By those glittering gems is thy heart beguiled;
They are false and vain,
And will fill thy heart with woe and pain.
Thou art on the uncertain stream of life,
Thou must grapple these for its toll and strife,
Thy way is dark,
Here's a compass true,
And there is a star, its beacon ray
Will guide thy bark
On its perilous way."

The angel ceased; for the mariner's eye
Is fixed on the shore where the treasure lies;
For the deeper tide he dips his oar
To join in its ceaseless strife and roar,
With anxious look and a brow of care,
He leads his bark with the baubles fair;
But heavier grows his heart the while;
No time has he to sing or smile,
But tolling over,
Along the shores of the widening river
He gathers his precious store.

He pauses a moment amid his toil
To gladden his sight with the shining spoil,
But, alas! each treacherous wave that swells
O'er the vessel's side
Sweeps off some gem to the greedy tide.

Then the mariner wakes from his mocking dream,
And finds he has passed far down the stream—
"O, why did I hurry on so fast,
My gems are lost, and my youth is past.
Alas! 'twas true what the Angel said—
But the little brook—where, where has it fled?
Far over the hills like a silver thread
It winds 'mid the music song-loving birds,
While the flowers echo back their low hissing words.
A toll worn man,
I have almost measured out life's span;
In these foam-crooked waves there's a message for me
By this solemn roar
And this widened shore,
I know I am nearing eternity's sea."

Then the Angel looked with pitying eye
O'er the surging waves, then came a sigh;
'Tis a perilous way to the port of heaven;
And now alone,
On a tide unknown,
By the veering winds thy bark is driven,
The star that shone so clear and bright
When I pointed thee to its guiding light,
Is dimmed with clouds; but its flickering ray
May shine again on thy gloomy way!
Watch well its light!

Thou'lt hope is dim and thy lot unblest,
It may lead thee to the port of rest.

Then the mariner watched with an earnest eye
For the flickering star in the troubled sky,
And watching thus, an ocean wave,
In its course sublime,
Swept round his bark,
And bore him out from the river of time.
Butler, Wis., 1850.

Choice Miscellany.

LAMP MUSINGS.

Written for Moore's Rural New-Yorker.

SILENCE! Not a leaf is stirred, not a breeze moves. Nature is taking a rest, a quiet repose; and so the earth floats softly the yielding space in the gentlest of all moods, with her great pulse beating slowly and her thousand voices hushed and stilled. There is something expressive in silence. Speak the word and your voice will fall to a whisper; think of it, and your mind will run back along the path of years to the first great SILENCE. In a book published long ago and not read as much as it should be, there is a passage which describes the place in which it dwelt; here it is:—"And the earth was without form, and void; and darkness was upon the face of the deep." In that darkness and over the dreary waste of those waters black, there reigned a solemn silence. Even the attendants of old chaos moved about in shadowy forms that made no noise, and the King himself spoke not, for no "palpating air" could tremble with a sound. Within those realms no whisper rose. Black gates that turned on vapor hinges, shut in those silent lands of moving mist, all tenanted of speech or echoing sound. No voice of birds—no rush of rolling streams—no gentle murmuring of a summer breeze—no grating voice of tempests hoarse—no whispered wailing of the golden grain—no clashing of embattled trees—no music from the voice of man—no deep-toned thunder from the hand of God: one deep mysterious silence reigned o'er all. Can mind conceive the nature of that silence? Can the deepest reasoning fathom it? In the music of nature, as well as in that which springs from the heart of man, there are sympathetic chords that oft-times mingle into one deep strain. So there are, also, periods of rest, that folds each in a calm repose; and how impressive is that repose! Here, far away from the "busy haunts of men," I may and do notice it in a striking

manner. Above, the moon in silence takes her evening walk; not a cloud moves—not a star sings—all is quiet there. Here around my western hearth there is the same stillness. I do not hear the whip-poor-will's voice—nor the cricket's hum—nor the beetle's droning notes—nor the katy-did's continual contradiction—nor the owl's cry—nor the watch-dog's bark—nor any of the "voices of the night."

The fact (in spite of all my wondering) still remains. Nature is resting in silence. Well, if her mighty energies need recuperation, those of man certainly do. It is a great thought, and I would that I could do it justice. From God to man two principles ever typify the nature of mind and intelligence—*labor and rest*. We may conceive, but we never can realize either the giant toil, or the mighty effort that in six days made Heaven and Earth, or the significant rest that followed the completion of the work; but the thought, deep and startling, remains, that even God rested. It is a natural result of a first cause. Think of it, children of earth—men of business when ye turn night into day and toil incessant on the ledger's page. Student of the midnight, damp and dim set pages, whose souls, laudable in effort, but untimpered with prudence, lingereth long within the "still small hours," and drinketh seeds of death in waters of knowledge—votary of science, training a nice result, or searching for another precedent to form the wondrous law of fact. And ye, citizens of a great metropolis, when ye seek pleasure in the theater or the concert room, and inhale the tainted air of closely fitting walls, remember that throughout the day ye labored, and your systems needeth rest. Remember that rest is a law of your nature, and it cannot be broken with impunity. O! how many energies have been wasted—how many bright eyes dimmed—how many burning lights extinguished in the fields of science—how many hearts beating strong with the highest impulses of an exalted humanity and full of generous love and sympathy for the beautiful and true of life, have been stilled forever by the iron band of endless labor. Let us go lovingly to rest, nor aim to emulate the ridiculous industry of some, who shut one eye in sleep and keep the other open in business.

Would you count the evils of an infringement of nature's rights, read the ages of the sleeping ones who lie within the cities of the dead! Not in a country burying place, but where the remains of the denizens of a crowded city are placed. There are seen mournful epitaphs of men and women who have destroyed themselves, who have gone to their long rest before their appointed time, by striving to interrupt the natural course of nature's laws, and by endeavoring to place in the balance sheet of their lives a greater amount of credit on the side of labor. When, O, man, wilt thou "know thyself?"

POOR CHARLES LAMB, how fond thou wast of silence, and how kindly didst thou look upon the thoughts which it gave! Thou couldst not ever love the quiet Quaker meeting houses, for an atmosphere of heavenly stillness surrounded those places, and man in quietude worshipped his Creator. Truly, when thy speech grew faint, and thy thoughts went seeking for oval vehicles in which to visit men, thou couldst think and write great thoughts in silence. And thou, too, dear THOMAS GRAY, singing thy immortal elegy in the "solemn stillness" of a "country churchyard," with the "glimmering landscape" fading on the sight, and the air lulled with "drowsy tinklings," thou knowest the charms of silence, for then thou couldst write in heavenly numbers that shall never die. O, silence! most favorable contemplation; most favorable to those severer thoughts that rise as the lark riseth, with alacrity to heaven, and most favorable to those just reflections which the great mystery of our lives present. Most favorable to the whisperings of that "soft still music of humanity" which strikes impromptu chords with that of a better land. Let others seek the "maddening crowd's ignoble strife"—let them learn to love the excitement of a city life; but oh, give to me the "stilly" night and quiet days of a country life where silence sometimes reigns.

There I may call in my transient memories, and look with profit on the faithful pictures which the artist hand of time has painted on the glowing past.—There I may learn how great secrets we perpetuate in our minds and bodies, each day of our lives—there I may administer to one the food of knowledge, and warm the other by the fires of exercise. But, if ambition calls me to the marts and trading places of the world, if within red walls I shall work out the sum of my destiny, let me have some seasons of silence such as this in which to grow better and wiser.

EXERCISE.—Throughout all nature, want of motion indicates weakness, corruption, inanimation, and death. Trenck, in his damp prison, leaped about like a lion, in his fetters of seventy pounds weight, in order to preserve his health; an illustrious physician observes—"I know not which is most necessary for the support of the human frame—food or motion. Were the exercise of the body attended to in a corresponding degree to that of the mind, men of learning would be more healthy and vigorous—of more general talents—of more ample, practical knowledge; more happy in their domestic lives; more enterprising and attached to their duties as men. In fine, with propriety it may be said that the highest refinement of mind, without improvement of the body, can never present anything more than half a human being."

THE NEW BORN AND THE DEAD.—Lavater, in his *Physiognomy*, makes the following curious remarks: "I have had occasion to observe some infants, immediately on their birth, and have found an astonishing resemblance between their profile and that of their father. A few days after this resemblance almost entirely disappeared, the influence of the air and food, and probably the change of posture, has so altered the design of the face, that you could believe it a different individual. I afterwards saw two of these children die, the one at six weeks, and the other at four years of age—and about twelve hours after their death they completely recovered the profile which had struck me so much at their birth; only the profile of the dead child was, as might be expected, more strongly marked, and more terse than that of the living."

THE NEW BORN AND THE DEAD.—Lavater, in his *Physiognomy*, makes the following curious remarks: "I have had occasion to observe some infants, immediately on their birth, and have found an astonishing resemblance between their profile and that of their father. A few days after this resemblance almost entirely disappeared, the influence of the air and food, and probably the change of posture, has so altered the design of the face, that you could believe it a different individual. I afterwards saw two of these children die, the one at six weeks, and the other at four years of age—and about twelve hours after their death they completely recovered the profile which had struck me so much at their birth; only the profile of the dead child was, as might be expected, more strongly marked, and more terse than that of the living."

"THY WILL BE DONE."

My God, my Father, while I stray
Far from my home in life's rough way,
O, teach me, from my heart, to say,
Thy will, my God, "Thy will be done."

Thou'lt dark my path, tho' and my lot,
Let me be still and murmur not,
But breathe the prayer, divinely taught,
"Thy will, O God, 'Thy will be done.'"

If Thou shouldst call me to resign
What most I prize—it ne'er was mine,
I only yield Thee what was Thine,
Thy will, O God, "Thy will be done."

If but my fainting heart be blessed,
With Thy sweet spirit for its guest,
My God! to Thee I leave the rest,
Thy will, O God, "Thy will be done."

Renew my will from day to day,
Blend it with Thine, and take away
All that now makes it hard to say,
Thy will, O God, "Thy will be done."

Then when on earth I breathe no more
The prayer oft mixed with grief before,
I'll sing upon a happier shore,
Thy will, my God, "Thy will be done."

VANITY OF WORLDLY THINGS.

WHERE are now the famed potentates whose powers extended over almost the whole earth?—Who is it that made them descend from their lofty height, and despoiled them of all treasures?—Whether have gone those vaunted heroes whose achievements drew forth such expressions of admiration; those learned prodigies of acquirements, whose writings are spread to the remotest corner of the globe; those sublime orators who decided the decrees of Senates at their pleasure? Ask where are the proud, the rich, the voluptuous, the loungers? where those haughty nobles, those hard masters, who so rigorously required such implicit obedience? Ask the earth—she will show you the places where they lie. Interrogate the tomb—it will tell you the narrow space in which their bodies are compressed. Their bodies? Do they then still exist? Perhaps a handful of dust may remain of each.

But whilst all around us thus passes away, whilst everything escapes us, the kingdom which shall not pass away draws nigh. So many revolutions, such a continual flux and reflux of human things, these perpetually changing scenes of a fleeting world, all point the end towards which we are hastening our steps. It is the voice of the bridegroom who calls us to the marriage feast, and by his reiterated warnings, urges us to walk accordingly. You who are deaf to this voice, who remain buried in the mire of earthly things, go down yet lower, and what will you find? The grave which is waiting for you, and into which you must descend, whether you will or not. Already death stands at your side, ready to fall upon you and drag you into it, as he has done with those who have preceded you.—*Book of the Fathers.*

"I'LL REST WHEN I GET HOME."

WHILE I was walking through a street in the city of —, a few days ago, I passed a man whose head was whitened and body bowed by the hardships of not less than sixty years. His limbs trembled under their heavy burden, and with much apparent effort he advanced but slowly. I overheard him talking in a low and subdued voice, evidently mourning over his weariness and poverty. Suddenly his tone changed, and his step quickened, as he exclaimed, "I'll rest when I get home."

Even the thought of rest filled him with new life, so that he pursued with energy his weary way. To me it was a lesson. If the thought of the refreshing rest of home encourages the careworn laborer, so that, almost unmindful of fatigue and burdens, he quickens his step homeward, surely the Christian, journeying heavenward, in view of such a rest, should press onward with renewed vigor.

This little incident often comes to mind amid the perplexing labors of the day, and stimulates me to more constant and earnest effort. Each laborer toiling in his Master's Vineyard, bearing the heat and burden of the day, can say, "I'll rest when I get home." Here let us be diligent in the service of our Lord, remembering that our rest is above. Fellow traveler, are your burdens grievous to be borne, so that you are ready to faint in the way?—Jesus says, "Come unto me, all ye that are weary and heavy laden, and I will give you rest." To rest from toil is sweet; to rest from sin is heaven.—*Christian Miscellany.*

FAITH IN GOD.—Have faith in God. Faith will be staggered even by loose stones in the way, if we look backward; if we look Godward, faith will not be staggered even by inaccessible mountains that stretch across and obstruct apparently our onward progress. "Go forward," is the voice from Heaven, and faith obeying, finds the mountains before it as flat as plains. "God with us," is the watchword of our warfare, the secret of our strength, the security of our triumph. "If thou canst believe, all things are possible to him that believeth." How strong faith is when we are just fresh from the fountain of redeeming love! A good conscience, and then faith will do all things, for it is in its very nature such as to let God work all; and we may say that it is most active when it is most passive, and that it wearies least when it does most work.

SWEARING.—"Trust not to the promise of a common swearer," says Francis Quarles, in his *Enchiridion*, "for he that dares sin against his God for neither profit or pleasure, will trespass against thee for his own advantage. He that dare break the precepts of his Father, will easily be persuaded to violate the promise unto his brother."

Not to hear conscience is a way to silence it.

The Apiary.

THE APIARIANS IN CONVENTION.

At a supposed meeting of the friends of improvement in Bee Culture, held on the 6th day of February, 1859.—Present, E. KIRBY and others—on motion, A. S. WADSWORTH was elected Chairman, and J. A. GILLET, Secretary.

Communications were read from the following gentlemen, viz.,

Milo Walton, of Amity, Maine.
C. A. Howe, of Homer, N. Y.
C. C. Wilson, of Niagara Co., N. Y.
M. Quinby of St. Johnsville, N. Y.

M. Quinby in one of his printed articles proposes that as soon as there is no further prospect of pleasant weather, in which the bees will fly out of their hives again for the season, the hives should be removed to a dry, dark, warm, and close room, into which too much air must not be admitted, as a very little will be sufficient, and there placed in such a manner that the hive will be reversed from its natural position, that is, standing on the top, leaving the bottom of the hive uppermost, and unprotected by the bottom board, to remain in this position till the warm weather of the following season.

E. Kirby, in reply to the communication, stated in behalf of the bees, that an All-wise Creator had endowed the bee with certain instincts which directed their operations. He has taught them in the pleasant weather of summer, to provide food and nourishment for themselves during such cold weather as would follow and confine them to their hives. The same Being has also taught them to deposit their honey at the top of their hives, and the bread and brood comb at the bottom. Consequently we find that during the winter, in a hive that stands in its usual position, the bees, after the cold weather sets in, collect in the upper part of the hive, where they have previously provided and placed their food, and during the winter all the chippings which they make, together with the bodies of their dead, and all other substances of an offensive nature, drop to the bottom of the hive, so that in the spring they will be prepared to have their houses swept and garnished.

The gentleman from St. Johnsville has done the subject of bee culture serious injustice by publishing so extensively his theories, advising all to treat their bees in so unfeeling and shameful a manner. To take them from the light of the sun, and consign them to a dark cell for six months or more of each year, perverting the laws of God, which he has in his goodness made for them—inverting their dwelling place, compelling them to go downwards for their food instead of going upwards, thus thwarting the laws which God has given them,—compelling them to drop the chippings of their comb and the dead bodies of their companions, to fall into that which in its natural position would be the top of the hive, among the honey. These chippings by dampness are thus soon caused to mould and sour, and with the dead bodies of the bees, to send up the effluvia which the bees are hardly able to endure, being confined contrary to the laws of health and the wisdom of God. After having been confined for a few months their distress becomes intolerable. At the least ray of light with sufficient warmth, the teachings of nature induce them to rush to the top of the hive, and not having sufficient light to leave the hive, are compelled, in order to find relief, to besmear themselves and comb, rendering their habitation more filthy than the hold of a slave ship filled with victims from the coast of Africa. Far better for them had they supplied themselves with a natural home, even as far north as where the mercury congeals in the winter, for under these circumstances even, cases are on record where they have been known to prosper.

C. C. Wilson, of Niagara Co., N. Y., has published a communication, on the subject of moisture and frost which he discovers during the cold weather in his hives, and asks "what is to be done?"—and in order to remedy this supposed difficulty, he proposes to bore holes in the top of the hive, that an equilibrium may become established between the atmosphere and the air in the hive, thereby dispelling either moisture or frost.

To these propositions from Mr. Wilson, Mr. Kirby replies:—God is the teacher of the bee, and His wisdom cannot err. He has taught the bees, on the approach of winter, to close every opening in their hive, except one at the bottom for ingress and egress. Why is this? In order that the heat generated by the natural warmth of their bodies should not escape but should remain in the upper part of the hive, to furnish them with warmth sufficient for their comfort and convenience. But by boring holes near the top of the hive, this design of the Creator is frustrated. The warm air by its lightness rises to the top of the hive, and escaping through the holes, leaves the interior of the hive nearly as cold as the external air, and thus the ingenuity of man deprives the bees in a great measure of that genial warmth which the wisdom of their Maker had provided for them.

Mr. Wilson speaks of the frost accumulating in the hive. This, as he correctly observes, is the frozen vapor arising from their bodies, and from this they obtain, during the winter, a supply of drink. But the current of air occasioned by boring holes in or near the top of the hive, carries off a large portion of this moisture, and thus deprives the bees of another source of health, which their kind Creator had intended for them. Now, in the language of Mr. Wilson, "what shall be done?" Locate your hives in such a place that they will be protected by buildings, high fences, or something of the kind from the north and west winds, and let them also front the south-east. Leave the hives through the winter in the open air. Take long straw and stand it up all around the hives; bind it around the bottom and bind the ends over the top, forming a thatch of straw four inches in thickness, leaving only a small opening for the passage of the bees at the bottom of the hive, and this opening you must be particularly careful to keep clear during the winter, and then there will be no danger but that they will stand the cold of our severest winters.

Mr. Quinby recommends that the hive be venti-

lated by raising it one-fourth of an inch from the bottom board, and that holes be bored in the top, and a box placed above to receive the moisture. — But while the God of Nature has taught the bee to close up all holes, except the small place of ingress and egress, in order that the requisite warmth and moisture may remain in the hive, do we not thwart both these purposes by raising the hive up and opening the holes in the top? Of what use to the bee will be the warmth generated in the hive, or the moisture there collected, to relieve its thirst, when both warmth and moisture have passed into the box above.

The Author of Nature has taken good care to defend all animals that are intended for cold climates against the severity of the winter. To the sheep he has given a thick fleece of wool—to animals of the Polar regions he has given a warm coat of soft fur—to the whale, the seal, and the walrus, an abundant supply of blubber; all orders of creatures, from the greatest to the least, are the objects of His care, and all receive from their kind Creator every provision which is necessary for their well being. Many of these He has so formed that man can render them subservient to his use. In our efforts to convert to our own use, any of the lower ranks of creatures we must first learn, and then obey the laws by which the Creator governs and sustains those creatures. If we act in accordance with His laws, all will be well. But God is unchangeable, and His laws are as unchangeable as their Author. So far as we go counter to these laws in our treatment of the animal creation, just so far we inflict misery upon those creatures, and just so far also will our attempts to render them subservient to our use prove a failure.

A communication from Mr. Walton, of Amity, Aroostook Co., Maine, stated that in the spring, after the first winter of his residence in that cold region—a winter during which, in one instance, the mercury in the thermometer was actually frozen—he traced some bees to their home in a large hollow pine tree which they had evidently occupied for some years. Several hundred pounds of honey were found, and notwithstanding the severity of the winters, the bees were numerous, healthy, and in the best condition. They had chosen their home without the direction of man, and could not have found a better one. The warm, thick walls of the hollow pine defended them well from the cold, and they neither had, nor did they need any ventilating holes in the top of their hive.

The communication from C. A. Howe, of Homer, N. Y., did not differ essentially from those first mentioned.

On a review of the various errors committed in the management of these useful little creatures, we are reminded of the words of Holy Writ—"Lo this have I found, that Thou madest man upright, but they have sought out many inventions."

On motion, it was resolved that a copy of the proceedings be forwarded to the Rural New-Yorker, for publication, and that the Convention stand adjourned "sine die."

J. A. GILLET, Sec'y

WHO INVESTS IN THE U. S. FUNDS?

HARPER'S WEEKLY contains an elaborate account of the Sub-Treasury in New York. We quote a passage which will be read with interest by the general reader:

Not the least curious desk in the sub-treasury is that of the clerk who pays the interest on the public debt. The coupons and interest on about seven-eighths of the debt of the United States are paid out of the sub-treasury in New York. The balance is in the shape of an inscribed debt, on which the interest is payable to the parties whose names are entered on the great rolls at Washington. Every six months the names of the parties are written out in a book at Washington and sent here to serve as a guide to the sub-treasurer.

These books are a curious study. Many of the names which they contain are household words. Some are the names of Europeans; others of West Indians, and even Asiatics. Barely a third of the public debt is held in this country. The bulk of it, we imagine, is held in continental Europe. One is not surprised to find the names of John J. Astor, Wm. B. Astor, Jacob Little, George Peabody, and such men, in a list of creditors of the United States; but they and their countrymen are in a minority. The heaviest foreign creditor we noticed is Lord Overstone, (the famous Jones Lloyd,) who has lent this country no less than \$350,000. A Spanish lady, Mercedes de Layseca, is our creditor to the tune of \$200,000, and a noble friend of hers, the Count Casa Montalvo Castillo, draws six per cent. on \$100,000. Several persons connected with the royal families of Europe are creditors of ours. The brother of the King of Naples took \$50,000 some years ago, and instructed his agent to invest the dividends, as they accrued, in the same security. He now owns over \$75,000. His niece, the daughter of Bomba, is registered as a creditor for over \$50,000. These wise people have been looking out for a rainy day. Another noble personage, the late Duchess of Orleans, has enough in the United States sixes to save the Count of Paris from being compelled to follow his grandfather's example and keep school; several of the Saxe Coburg Gothas have also invested in the same security.

The Count Rossi saw enough of this country, while he was here, to invest a few thousands in the famous name of Sontag; and little Paul Julien has a trifle—enough to keep him when his violin fails. One can readily account for the appearance of the name of the Rothschilds, both of London and Paris; but it is curious to note that the famous publisher, Panckouke, of Paris, is a creditor of the United States; and that the dramatic author, Scriba, has also invested enough to give him nearly 10,000 francs a year. A careful study of Democracy in America appears to have persuaded

THE FALCON.

The Falcon was a bird much honored in the days of chivalry, but in these latter times of utilitarianism and gunpowder, has been degraded from its honorable position, and made to take its true place among the feathered tribe. He is, in fact, only a hawk,—a blood-thirsty, rapacious, unscrupulous robber, the hated enemy of all the feathered tribe, and the legitimate aim of every old shot-gun, in the hands of man or boy, that can be fired off without the danger of bursting.

There are a great many branches of the hawk family, but like many aristocratic families among men, they have all sunk very low in public estimation, the unenviable characteristics of the tribe rendering them unfit associates in a well-ordered and peaceful community. The rearing and employment of the falcon in the sports of the field was essentially an aristocratic prerogative, and could only be maintained in those times when the iron rule of despotism rendered the mass of men mere tools and machines to minister to the wants and caprices of the few. The march of civilization, and the invention of artificial means whereby the feathered tribes are made to fall before death-dealing fire-arms, have rendered the services of the falcon as useless as they are cruel. Fine ladies do not now indulge in the cruel sport of sending a rapacious hawk in pursuit of a poor fugitive songster of the forest, and clap their hands over the successful seizure of the prey.

Falconry is a very old amusement in Europe and Asia. In the middle ages it was the favorite sport of princes and nobles; and as ladies could engage in it, it became very prevalent, as a gentle kind of hunting, in which wives, daughters and lady-loves could engage equally with their husbands, fathers and lovers. The falcon was trained with the greatest care, taught to pursue the bird, as soon as released from the hand, and return with it to its keeper. The falcon was generally blinded until the game appeared in sight, by having the head covered with a leather hood. This hood was removed when the game appeared in sight, and the bird which was taught to perch upon the wrist was immediately released to commence the chase, while the spectators looked on in the greatest excitement, cheering the falcon by various well known signals.

In the East, this pastime is still to some extent, pursued, and the Persians are particularly skillful in training falcons. They hawk after all kinds of birds, and even after gazelles. The falcons are taught to fas-

ten themselves on the heads of these creatures, and peck at their eyes, which checks them until the hounds come up to dispatch them. This sport is also popular in Palestine. Dr. Thompson, in his travels, says:—"The emiers and feudal chiefs of the country hunt the partridge and other birds with the hawk, and keep up, with great pride, the ancient sport of falconry. The falcons are of two kinds, a large one for woodcock and red-legged partridges, and a smaller for the quail. The Beg at the castle of Tibnin, always keeps several of these large falcons on their perches in his grand reception-hall, where they are tended with the utmost care. I have been out on the mountains to see them hunt, and it is a most exciting scene. The emiers sit on their horses, holding the birds on their wrists, and the woods are filled with their retainers, beating about and shouting, to start up and drive towards them the poor partridges.—When near enough, the falcon is launched from the hand, and swoops down upon his victim like an eagle hasting to the prey. After he has struck his quarry, the falcon flies a short distance, and lights on the ground, amid the redoubled shouts of the sportsmen. The keeper darts forward, secures both, cuts the throat of the partridge, and allows his captor to suck its blood. This is his reward. Notwithstanding the exhilaration of the sport, I could never endure the falcon himself. There is something almost satanic in his eye, and in the ferocity with which he drinks the warm life-blood of his innocent victim. I once saw some men of Tortosa catching the Syrian quail with a small hawk. This was done on foot, each sportsman carrying his bird on the right wrist, and beating the bushes with a stick held in his left hand. These quails are less than the American; are migratory, coming here in early spring, and passing on to the north. They hide under the bushes, and will not rise on the wing unless forced to do so by a dog, or by the hunter himself. I was surprised to see how quickly and surely the little hawk seized his game. His reward, also, was merely the blood of the bird. I do not know whether or not the Jews in ancient days were acquainted with falconry, but David complains that Saul hunted for his blood as one doth hunt for a partridge in the mountains; and this hunting of the same bird on these mountains, and giving their blood to the hawk, reminds one of the sad complaint of the persecuted son of Jesse."

Monsieur de Tocqueville to lodge some of his savings in the hands of our government; and Lord Macaulay, who began with a bagatelle, of some \$5,000, has since increased his venture to nearly \$30,000. But we should never end if we attempt to enumerate all the people who think their money well placed in United States securities. Here are Lord Dundonable, the great sailor, who has a large sum for a son of Neptune; the Prince de Beauveau, the Count de Narbonne, Sir John Balyer, the Marquis of Champagne, Baring Brothers, Count de Beaumont, Gen. Rermoloff, and a host of other titled people, who, perhaps, depend on the honesty and solvency of the United States government for a living. Lord Elgin saw enough of us to leave \$17,500 of his savings in our six per cent; and the famous Russian, Alexandre Herzen, has a bagatelle of \$80,000 in the same security. There is another creditor whose name is a curiosity. It runs thus: Baron Louis Numa Epaminondas Justinian Artstides Decius Salis Haldenstein Lichtenstein Grotenstein. Fancy a man with such a name drawing twenty-six dollars and fifty cents from the United States.

WHAT PEOPLE EAT.

This is the heading of an article in the Indiana American. We copy it below:

"I suppose, you have heard that 'Jack Sprat' could eat no fat; his wife could eat no lean.'—Come along with me, and let us take dinner to-day in one nation, to-morrow in another, until we go all over the world, and we will find that there are worse people than Jack Sprat and his wife, so far as regards likes and dislikes.

We take dinner to-day with the Frenchman, and find prepared for our entertainment a piping dish of fried frogs. You must not look disgusted at your dinner, for frogs are as nice an animal in their habits as many things we eat at home. Another day we sit at meat with the Chinaman. Here we have the most refined cookery the world knows. Shark's fins are before you. Soups made of birds' nests, invite the appetite with relishes of salted fishing worms, grubs, moths, etc. If you are not

satisfied with these delicacies, you will find convenient a cut of roast dog, cat or rat. Do you not still feel disgusted, for none of these look worse than the slimy lump of inert matter, called oyster, which, should you offer it to a Chinaman, would be rejected as unfit for food.

The Romans feasted on *garrum*, which is a pickle made of fishes' blood and gills, while they were forbidden by law to eat poultry.

Look at the Esquimaux family at supper, and perhaps you, and I too, would be disgusted at the manner of sopping their bread in whale's oil, which is our stinking tanner's oil; and the little oil eater would be equally disgusted with you if he saw you eating sugar.

The South American hunter, wishing to give us the best entertainment in his power, provides for us a roast monkey, and is astonished that we cannot relish the feast with him.

In Central America, the greatest delicacy is cooked monkey and boiled water lizards. I have myself seen the Guatemalan shoot the lizard as it lay upon the bush overhanging the water, and as the victim fell and sank in the water he would dive for it, and bring it up as it entwined itself about his arm in its dying agonies. With this boiled in a pot of plantain, he had a most delicious feast.

We, too, eat many things that are not eaten by others. The hog is regarded as unfit for food by the Jews."

MENTAL INDEPENDENCE.—Every man and woman is brought up from the cradle with a bias. The mind is never sent out into the world's life unfettered. It carries with it always the heavy chain of habit. The politics of the father; the politics of the son; the religious character of the household is the seed of many more households of like faith. It is a strong and admirable mind indeed, which, nursed in error, has the courage and heroism to begin its own emancipation. It requires more courage to think differently from the multitude than it does to fight them. The first hero, therefore, was not he who made the first conquest, but he uttered the first doubt.

YOUNG RURALIST.

"HOO OUT YOUR ROW."

DEAR RURAL:—Inclosed please find a few lines which I would like to have your many ten thousands of readers peruse, if you think them worthy of a place in the YOUNG RURALIST. If you ever hoed corn when a boy, in the long hot days of June, you know how to appreciate the first verse.

A FRIEND AND SUBSCRIBER.

On a lazy day a farmer's boy
Was hoeing out the corn,
And moodily had listened long
To hear the dinner horn.
The welcome blast was heard at last,
And down he dropped his hoe;
But the good man shouted in his ear,
"My boy, hoe out your row!"

Although a "hard one" was the row,
To use a plowman's phrase,
And the lad, as sailors have it,
Beginning well to "haze"—
"I can," said he, and manfully
He seized again his hoe;
And the good man smiled to see
The boy hoe out his row.

The lad the text remembered,
And proved the moral well,
That perseverance to the end
At last will nobly tell.
Take courage, man, resolve you can,
And strike a vigorous blow;
In life's great field of varied toil
Always hoe out your row.

COUNTRY AND CITY BOYS.

MESSRS. EDS.:—In the last number of the RURAL, under the heading which I have chosen for this article, "Unns" describes, and very justly lashes, "a loafish class of boys" to be found in every city, and to some extent also in every country village. I have nothing to say in defence of the conduct spoken of—on the contrary, I am glad to see the perpetrators shown up, and I hope many of them will look at their own portraits as drawn by Unns, until they are heartily ashamed of themselves, and resolve upon a thorough reformation. The boy, it has been said, is "the father of the man," and if the boy is vulgar, rowdyish and dishonest, what will the man be? Boys are traveling on the road to manhood, but they are going in very different directions, and in consequence will arrive at very different ends, unless some of them consider, stop and turn from their evil ways,—unless, in the language of Scripture, they "cease to do evil and learn to do well." Some are going as fast as time and their own evil conduct can take them, to the Jail and State Prison,—others with less disposition to evil, but lazy and careless, are very likely to find a home in the Poor-House,—still others, jovial, fond of fun and frolicsome company, and learning to tittle, are marching in a direct line to the drunkard's grave. A few, alas, too few, are studious, active, honest, respected and loved by all who know them—they will make what has been said to be the noblest work of God—*honest men*. They are traveling in the high road to honor—they will make respectable, useful men, in whose prosperity and advancement all good people will delight.

But "Unns" seems to wish us to think that bad boys are confined to cities. Should he live in a city, or visit one on the 4th of July, or on any holiday, he would be very quickly undeceived. He would then find the most noisy and ill-bred young men—those who made the most noise and drank the most poison—would be from the country. At the same time I have no doubt many of the "loafish class" of city boys might be found at the country taverns. When persons, (boys or men,) do things that they are ashamed of, they like to get where they are not known.

There are mean boys both in the country and in the city. Cannot something be done to show them the folly of their course, and induce them to walk in "wisdom's ways?"

THE TWO FOOLS.

When quite a small boy, like most other youths, I had a great inclination to attend all the shows, circuses, negro-dances, concerts, etc., that came along. On one occasion I was very much amused at the wit of the clown, who was convulsing the crowd by his grotesque appearance and witty sayings. After a while he said something the crowd did not consider very "funny," and at which no one laughed, when a drunken man, no longer able to hold his tongue, cried out, "You're a fool!" "True," responded the clown, "and so are you; the only difference between us is, I am a fool for money, and you are a fool for nothing."

Now whenever I see large placards stuck up, announcing the arrival of a "strange animal," "unrivaled circus," "a wonderful attraction," etc., I invariably think of the saying of the clown, "I am a fool for money, and you are a fool for nothing," and stay away. There is generally but one clown, but a great many of the others.

When I see advertised in the papers, "splendid lottery schemes," "sixty thousand dollar prizes," "great inducements to buy," "almost certain of a prize," etc., I think of the clown's "two fools," and how many buy and but one sells, and excuse myself from buying a ticket. "One is a fool for money," the other is "a fool for nothing."

When I pass a splendid saloon, with decanters of sparkling wines and brandies set around in the most inviting manner, with smiling clerks ready to hand you "a glass," I am sure to think "there is a fool for money," and, as the deluded wretches crowd around the counter, "these are fools for nothing."

When I hear of some "divine" woman going about singing Italian songs, and men paying from ten to four hundred dollars a night for seats to hear, and when they cannot understand one word of it, I think of the "two fools," and keep my money in my pocket.

In short, Sir, whenever any "unusual attraction," any "rare chances for speculation," offer, I suspect at once, that if I take hold of it, there will be another fool at the other end, and so let it alone.

Old World Matters.

The steamer City of Baltimore arrived at New York on the 12th inst., with Liverpool dates to March 20th. We make the following synopsis: **General Buxton**, the first of the new Parliament, has been elected. The first of the new Parliament has been elected. The first of the new Parliament has been elected.

In the House of Lords, Earl Malmesbury, in reply to Earl Clarendon, made a long explanation touching Lord Cowley's mission and the proposed Congress. He said the composition of the Congress had not been decided on, although he had no doubt it soon would be. Government were desirous that every one of the Italian States should be represented, and their object was to recommend to the Italian people what they believed would be for their own good and for the safety of Europe.

Both Austria and Piedmont had formerly declared that they would not attack one another, and would abstain from hostilities. There was reason to hope therefore, that peace would not be broken, and that the Congress would reach the result that all Europe desired.

A report was forwarded upon John Packer's motion on the subject of the Honduras Oceanic Railway. It was stated that a substantial contractor had offered to construct a Railway for \$3,500,000.

The Vienna correspondent of the London Times says, although Austria consents to attend the Congress, she has no belief that peace will be maintained. Therefore she continues her armaments.

Count Cavour writes to the Sardinian Ambassador at London, in reply to a question propounded by the British Government, that it will be impossible for Sardinia to remain defenseless in the face of the provoking and avowed attitude of Austria.

FRANCE.—The meeting of the new European Congress had been fixed for the 1st of May, probably at Baden. It will be attended by Cabinet Ministers, namely: Malmesbury, for England; Bismarck, for Prussia; Gortschakoff, for Russia; Buol, for Austria; and Scheinitz, for Prussia. The Italian States will be indirectly represented. Lord Cowley will assist Malmesbury, and M. de l'Hay will act as Secretary to Wladyslaw.

The latest reports are, that while Piedmont will have a seat in the Congress, she will not have a vote; and that other Italianists will be admitted on the same conditions.

The announcement of this Congress has not produced any improvement in the general trade of France. All the war material recently prepared, such as artillery projectiles, floating tents, &c., were to be stored at Lyons and Marseilles.

Paris letter-writers state that armaments were going on in France without relaxation. Government had also decided upon adding a fourth battalion to each of the hundred regiments of the line.

It is contemplated that by the close of March, Austria would have in Lombardy 70 battalions of infantry, which would be the artillery, cavalry, engineers, &c., would make her army in Italy number about 220,000 strong.

Letters from Palermo announce that 1,200 Austrians, with cannon and other war equipments, had arrived there. The church had been converted into a flour magazine.

Warlike preparations were also going actively forward in other portions of Italy.

THE RUSSIAN INVASION OF CUBA.—The Journal of Commerce, alluding to the rumors of the invasion of Cuba, says:—"The local disaffection is said to be widely spread, and the plan of revolt so skilfully made and carefully matured, that—unless this should be treachery—it will not fail of success. The New York export-merchants are mostly young men, many of them sons of wealthy Cubans, but the leaders are men of age and experience, who have long been identified with the cause of Cuban freedom. Of the latter, General Goicouria is reported to be one, and his sailing in the Cahawba for Havana is supposed to have some connection with the hazardous enterprise. Whatever truth there may be in these reports, it is a fact that the Spanish Consul at this port is considerably excited by them, and sent out warning dispatches to the Governor-General of Cuba by the last steamer. The Spanish Minister was also sufficiently alarmed to come on from Washington, and is now waiting further intelligence in this city."

THE TEXAS INDIANS.—A New Orleans despatch of the 12th inst. says that Capt. Ford's company of Texas Rangers, numbering forty-seven, had been surrounded in the southern part of the State by eight hundred Indians, and a desperate battle ensued, in which Captain Forbes and four of his men were killed, and the remainder of the company were taken prisoner. Great excitement prevails on the frontier, and large companies will proceed in search of the Indians.

A LIST OF AMERICAN SOLDIERS.—The N. Y. Sun says a list of Cuban patriots sailed from this port the latter part of March with arms and ammunition. Most of them are young men and sons of the leading men of the Island, and all determined to free their native soil or die in the attempt. Their landing was to be the signal for the revolt to the patriots already on the Island. The first day of April was the day fixed for it.

THE NEW YORK POLICE QUESTION.—The Court of Appeals has decided that the old Police force in New York are still in office, their discharge by the Metropolitan Commissioners having been illegal. Judges Gray, Strong, Constock, Sedden and Allen concur in the decision, and Judges Johnson, Denio and Grover dissent. This ruling will cost New York city more than a million dollars.

A NEW KEY TO THE GULF.—It is now proposed to get rid of the acquisition of Cuba, by providing another key to the Gulf of Mexico, than the Queen of the Antilles. The plan is to dig a Ship Canal across the peninsula of Florida. The distance is only 100 miles, the country low and favorable for such a work, and the cost estimated at \$10,000,000.

THE CANADIAN LAW IN CANADA.—We understand that many anonymously signed petitions for a Prohibitory Import Law, have been presented to the Canadian House of Assembly.

THE END

For the benefit of those districts yet troubled

with that deleterious disease. I give the following very simple and easy process, which I have used many years and find a perfect remedy:—Four the seed on any tight floor, and to about every bushel throw on one pint of oil or water slaked lime—water is best, as it is free of carbonic acid, which renders it more or less inactive, then with a shovel thoroughly mix it and leave it in a compact pile. Then sprinkle on water till it begins to run off at the bottom, and a thoroughly shovelled it over, leaving it in a pile till the next day, when it is fit for sowing, and may be kept thus for a week without injury, if spread out and stirred.

This process is as effectual as all the far-fetched, and empirical nostrums that have ever been proposed.

L. B. MAXLEY.

Monroe County, N. Y., April, 1859.

CHEAP MODE OF UNDERDRAINING.

MR. MOORE. I wish to make known to the farming community, through your valuable paper, a cheap and effectual mode of underdraining. I would premise by telling you that for the last ten years I have underdrained extensively with tile, and last year, being desirous of draining a piece of land very early, I could not for love or money procure any tile. Being in this predicament, I used brush in place of tiles. I had my ditches cut in the same manner as for tiles, with the regular draining tools, and then laid in brush cut in lengths of four or five feet, from 1 inch to 2 inches in diameter. On this I placed the smaller brush in bunches; then, pressing all down tight, I placed a layer of straw, and filled in. The land was then ready for the plow, and I raised a fair crop of corn. Since then a year has elapsed, and this spring the same land is already in oats and seeded down. Having occasion to put in another branch drain this year, in connection with the main one put in last year, I examined the old brush and found it as fresh and good as the day I put it in.

Now, Sir, this brush will last for at least twenty years, and my drains will have only cost the price of digging. Now, this expense lies within the reach of every farmer whose land requires drains, and what land does not call for it, unless a light loam on a gravelly subsoil? The objection to tiling has been that it is too expensive, but I know it will pay a heavy per centage. I now offer a very cheap way, if the disposition lies in a man to improve his land. Let any farmer give it a fair trial, say only on one single acre, and then keep an account of the produce of that solitary acre, and he will be satisfied. But "a word to the wise," &c.

Encouraged by what I had done last year, I have this year brush-drained a good many acres, and now continue to do so. One piece of four acres thus done would have required \$50 worth of tile. This piece was so wet I could do nothing with it; but it is now thoroughly drained, as dry as need be, and has been plowed and waiting for the proper time to receive the corn. I may remark that I had heavily manured this piece of land, having hauled my manure on it in a frozen condition, but all this would have been useless if I had allowed the water to remain on the land.

If you think these observations are worthy of consideration, or a place in your valuable paper, you may probably hear from me again on the subject of draining. Any person desirous of seeing this mode of draining can satisfy themselves by giving me a call, and I shall be most happy to show them and give them all information on that head.

Yours, &c., W. L. LOUIS.

Willford Farm, Seneca, N. Y., April, 1859.

P. S.—I fear many might doubt me if I affirm that I have land that has only cost me \$5 per acre to drain, but such is the fact.

W. L. L.

CLERICAL FARMING.

I own day came to the conclusion, like many other of my brethren, that I must do something to eke out an inadequate salary, and provide for the wants of a hearty, hungry family. I was running behind every year, and getting in debt. I had a couple of stout boys, old enough to be of a good deal of use. They were anxious to move into the country. I had a passion for the country myself. I was born on a farm. But all my practical knowledge of Georgics had been confined to the cultivation of a paragon garden, and of Bucolics to the care of a minister's single cow. I enjoyed sound health—hadn't a single clerical disease about me. I had considerable confidence in my power of adapting myself to circumstances, and doing well whatever I should undertake; and as I reached middle life, and my hair came to be well streaked with gray, a strong yearning grew upon me to become an owner of the soil, and wrestle with Nature for a better subsistence than my clerical labors during twenty previous years had afforded me.

So it was decided, after much deliberation in the family, and earnest prayer to that Gracious Power who directs the steps of such as wait upon Him, to purchase a farm; so a farm was found at a convenient distance from the scene of my professional labors, of convenient size, and on convenient terms, and just as March was going out, roaring in the most ferocious style, I packed my family and effects into sleighs, and moved out over huge snow banks, into the old-fashioned, low farm-house I found on the premises. I should say, however, that from the time I decided on the purchase, I began to "gram" myself most diligently with agricultural knowledge. The first thing, (and you will surely acknowledge I couldn't have done better,) was to subscribe for the Rural New-Yorker. I then got all the volumes of the "Transactions" I could find. I studied carefully the volumes on Agriculture and Geology in the Natural History of the State. I got various other Agricultural works, and pored upon them as Homer advised the young orator to study the exemplars of Greece. I ought to mention especially, that I derived great benefit from those two admirable treatises composing the Farmers' Library, Vol. I.—Pettibald's Chemistry, and Thayer's Agriculture. The latter, though containing many things not applicable to the present state of agriculture in this country, is the work of a great mind, able to grasp broad principles, and familiar with the minutest calculations and details.

Thus crammed with "book farming," I entered on my first practical experiences, and hardly was my moving finished, before I had my team at work

improving the last snows of April to draw out as much as possible of the huge deposits which I found accumulated around the barns. This brings me to speak more particularly of my farm. My eye had first been attracted by a noble point embraced in it, jutting boldly out into a fine sheet of water. From the bluff at the point the ground falls away toward a plank road which intersects the farm, leaving on the lake side some fifteen acres of beautiful meadow land. We had lately been reading LONOWALLOW'S Indian romance, and agreed to baptize the place "Muskoday,"—the meadows.

I now began a thorough examination of the soil and subsoil, and, greatly to my satisfaction, found it much better than I had been led to expect. It was called a poor farm—a wet farm, fit for nothing but grass, &c. Indeed, its superficial appearance justified the most unfavorable criticism. The high and dry parts were overrun with Canada thistles. On the meadows, the cultivated grasses had run out, and been superseded by a dozen varieties of the coarsest sedge. The orchard had apparently been uncultivated by saw or knife for ten years, and was choked by excess of wood. There was scarcely a fence that would turn a cow of the least enterprise. Through the misfortune rather than the fault of the old owners, the farm had barely produced enough for years before to pay the taxes.

On examination I found that the higher parts of the farm comprised some twenty acres admirably adapted to the culture of wheat. The soil was a loose gravelly loam, overlying the "Marcellus Shales," which rapidly disintegrate from the weather, and break up easily under the plow. On this land I had two plows at work during the recent fine weather, without finding the least obstruction from either frost or wet. The rest of the farm I found to consist of a rich vegetable mould with subsoil of sand, easily worked, and as well adapted as any one could desire to corn, vines, roots, or any ordinary culture. That it wanted draining was obvious. The water stood late upon it in spring; but it was equally plain, both from the soil and the grades, that nothing would be easier than to drain it thoroughly. Two or three acres, lying by the lake shore, almost swampy, I found to consist of heavy turf resting on a fine grey beach sand; and this I set apart for a cranberry yard. So I had my work before me, having spied out the actual nakedness of the land, and its potential capabilities. But this story has already occupied as much space as I can expect. If your patience holds out, I may have something to say regarding my further experience that will tend to encourage other adventurers in farming, whether clerical or lay.

Muskoday Farm, N. Y.

CHINESE SUGAR CANE.

MR. MOORE.—I do not observe in any of the published accounts that any person in this State, or in the Eastern States, has yet succeeded in making sugar from this article, though, according to the Patent Office Report, various persons situated farther south, have been entirely successful; in some cases it crystallized into a solid mass, with very little drainage of molasses, while others, at the west and east, after following all the prescribed methods, even the use of bone dust and other known clarifiers, have been unable to reach that result.

Our climate is not warm and genial enough to perfect the saccharine matter; it is too green and unripe a state—the juices are like the true sugar cane at the south, the upper joints of that kind will not make sugar, and the productiveness of the crop, every year, depends upon the number of joints ripened, and perhaps we might succeed better, if we only used those near the root, which evidently contain a thicker and stronger juice than the upper joints; which are thin, less sweet, and consorted with starch, acids and gummy matter, that are an absolute hindrance to crystallization.

All matter (and what is not matter ceases to be) is composed of definite moliform atoms—yes, every substance known in the material world, is wonderfully endowed by this law, to form each its separate duty and material. The air, all gases, water, the blood, all minerals and vegetables and their component parts, are formed by its peculiar shaped atoms, invisible in most cases to microscopic eye. The infinitesimal globules of butter are so enveloped by the casein or curd, that great labor is required to break the enchantment and allow the butyricaceous particles to congregate and form butter. So with our cane juice, but slightly supplied with saccharine matter, is so surrounded with the starchy, albuminous and mucilaginous material in its unripe state, that it is impossible for the atoms of sugar to separate and join their congeners and crystallize. The lower and ripened joints might realize a different issue.

A few years since the production of silk was the popular hobby, and hardly any family "with souls above buttons," but what experimented in that mania, which was the universal topic of conversation and the trumpeting of the public prints—not a paper, daily or weekly, but what made this subject a constant theme, until silk worms and multicaulis ruined thousands. Where is the great speculation now?—gone to the tomb of the Capulets. There is great danger of a like result for the sugar cane. Its successful operation depends on so many contingencies—so foreign to the habits and abilities of farmers in general—requiring strong, well-made iron crushing rollers and evaporating pans differing from any thing in common use, that well-grounded fears may be indulged that this valuable addition to domestic comforts, and even as a profitable crop, will be abandoned and sink into the dark waters of neglect and forgetfulness.

M. Y.

Prolific Sheep.

I HAVE wintered twenty New Leicester and Cotswold ewes. Within the past two weeks they have dropped 80 lambs—10 pair of twins, and 10 single lambs. Two we lost by accident, one other got chilled and perished. This is 150 per cent. increase. I have even exceeded this in past years. In 1856, 36 ewes of the same blood dropped 44 lambs—18 pair of twins, 1 pair triplets, and nine single lambs. Perhaps others may have been more successful. If so, I should be pleased to hear from them.—JOHN BAKER, Macedon, N. Y., 4th mo., '59.

Condensed Correspondence.

Plowing—An Experience.

HAVING read what has been said in the Rural about plowing deep, and especially in that of the 16th by brother O., which revealed his troubles to his friends and called upon them for help, I am induced to relate a portion of my experience. When but a boy, living at home, I broke up about four acres of hard-pan land in February, at an average of about four inches, some less than that—the plow at all times running on the hard-pan, leaving the bottom of the furrow as blue as a whetstone. In the spring, sowed to oats, and raised a fair crop. Cut very high, and plowed in the stubble as deep as two horses could plow, and continued to work in the same manner for six years in succession, when the hard-pan had entirely disappeared and the oats grew so large that it took me from sunrise until 5 o'clock to cut them, and at that time my cradle could keep up with any in that vicinity. It is now twenty years since I broke up that field, and it continues to bear large crops of corn, barley and grass. I am now on a farm composed of a stiff loam from 16 to 20 inches, with a hard-pan subsoil. I get the largest corn by plowing deep in the fall and ridging lightly in the spring, which keeps it dry and warm in the spring and causes it to root deep, from eight to twelve inches, and thereby enables it to stand the drouth in midsummer. My corn was the only corn planted in this way in this neighborhood last year, and was affected less by the cold, wet weather than any other. I shall continue to follow Poor Richard's saying—S. E. L., Wirt, Allegany Co., N. Y., 1859.

Jerusalem Artichokes.

LAST year I raised two varieties of Jerusalem Artichokes, one a large red, and another a white variety. The red is larger and yields most, while the white is more nutritious. The yield of the red variety was about fifteen hundred bushels per acre, and the white ones yielded over one thousand bushels per acre. I have fed them to most kinds of stock, and they are exceedingly fond of them, particularly horses. Hogs will dig them, when the ground is not frozen, for themselves and other stock. They are not injured by freezing, and are very easily preserved for winter use, and can be raised at a cost not to exceed four or five cents per bushel. They should be planted early in spring, but will yield well if planted any time before the first of May. I plant them two by four feet, with one piece in a hill, and cultivate about the same as corn, although it is not so much work to keep them clear from weeds on account of their shade.—L. D. SCOTT, Milan, Ohio.

A Good Fence.

As many farmers are now fencing, I will mention a kind of fence which is thought very good hereabouts. It is a combination of wall and board fence. About two feet (or two and a half) is stone wall, and the top part boards. The posts are pointed and driven in the ground, the wall built around them, and two boards nailed on top completes the fence. Such a fence in a frosty, windy country, has many advantages over every other. The posts and wall mutually support each other, and as to the topping it cannot blow off. Fence made entirely of boards, stone, or rails, frequently gets out of repair, while a fence made as described stands firm and unshaken.—H. K. F., Cambridge Valley, N. Y., 1859.

Inquiries and Answers.

STUMP MACHINES.—As your paper is getting to be the medium through which we look for the improvements in Agriculture, &c., will you, or some of your subscribers, inform us which is the best constructed stump machine—one the price of which will come within the range of farmers in moderate circumstances? If convenient describe so that one could be made from the description.—M. S. BAKER, Portland, Me., 1859.

We have illustrated and described several Stump Machines in former volumes—including one or two patent ones—but are not prepared to say which is the best and cheapest now obtainable.—We have received several inquiries on the subject within a few days, and shall be glad to give the desired information from those who can speak from experience.

NEW CHURN.—Will you please inform me as to the success of the machine for churning new milk? If worthy of attention, where can it be had? Your answer will much oblige—A. NEW SUBSCRIBER, Seneca Falls, N. Y., 1859.

We have heard of, but not seen, the new invention. A friend, who is investigating the subject, says the new churn is evidently the long sought desideratum. Do not think it is yet offered in market, else it would be advertised in the agricultural journals.

BEE AND BEE-HIVES.—Will you, or some of the many readers of your truly valuable paper, please inform me through the Rural as to the best plan for constructing an apiary? Also, of the best bee-hive in general use? And whether you, or any of your readers, have used STRATTON'S DAVIS' Platform Bee-hive, and if so, if a good hive?—W. Q. RICHES, Malone, Franklin Co., N. Y., 1859.

Will you, or some of your able correspondents, inform me through the Rural which is the best plan for constructing bee-hives? Also, which is the best book treating on bees?—J. H. SMITH, Dundas, C. W., 1859.

We shall be glad to receive from some experienced apiarian, a good or the best plan for constructing an apiary. As to which is the best hive, and which the best book, doctor's disagree, and we can hardly admit replies from interested parties—except in our advertising department.

DRAIN TILE, &c.—I wish to inquire through the Rural if there is any place on the Central Railroad or Canal, especially between Rochester and Syracuse, where good drain tile are manufactured, and the price per thousand? Also, if any of your numerous readers have had any experience in making and laying cement tile—made of water lime and sand—and what is the cost per thousand.—D. J. B., Camillus, Onondaga Co., N. Y., 1859.

There are, we presume, several points on the road and canal named, where drain tile are made; and the manufacturers would probably let the fact be known in the Rural were they not afraid of being crowded by a rush of customers!

Rural Spirit of the Press.

Culture of Corn.

A CORRESPONDENT of the Ohio Cultivator says:—The grand axioms in corn raising are—Good ground well prepared, early and careful planting, early cultivation and hoeing, and destruction of all weeds the summer through. If prompt and energetic action is important and necessary anywhere, it is most emphatically so in a corn-field. But go into any department of labor, and who wins? The easy, the indolent, the careless? No! The Micawbers who are always waiting for "something to turn up"—some God-send or another—never accomplish anything, but die before their visions are realized. It is certainly not these, but the man of energy, of method—the man of steady work and close calculation who succeeds, in all positions.

Harrowing and Rolling Wheat.

EDWARD MASON writes in the Michigan Farmer as follows:—It is a well established fact, that harrowing and rolling wheat in spring, are very beneficial to the crop, and most destructive to those "pests of the farm" which mar the hopes of the farmer. The pupa of those formidable insects, the "wheat" and "Hessian" flies lie, buried in the earth, near the roots of the young plants, at the depth of about one inch from the surface, when they are torn up by the harrow, and exposed prematurely to cold weather, myriads of them are destroyed. Besides the good done in this way, harrowing breaks lumps, fills up the cracks and fissures, and softens the soil around the roots of the wheat.

Subsoil Plowing.

In an article upon this subject, the editor of the Working Farmer calls the attention of his readers to the advantages of the system, summing up thus:—"The use of the subsoil plow does not elevate the subsoil to the surface, and thus removes the only objection ever urged against its use. It does permit the atmosphere to enter the soil to a greater depth. It enables the roots to travel through larger portions of the soil, and thus come in contact with a greater amount of food. It prepares the subsoil for future elevation and admixture with the surface soil, thus deepening all our soils. It does away with sourness of soil. It prevents drouth, by enabling the moisture to come in contact with the cold surfaces on which it will be deposited by condensation. No well subsoiled field ever suffered from drouth. No subsoiled meadows ever run out. For until roots are brought in contact with cold and undisturbed subsoil, their crowns can never cease to tiller, and thus replace such crowns as may be broken by cattle's feet while pasturing. Old meadows may be subsoiled without turning over the sod, lifting the whole field half an inch, suffering dead roots to decay, and new ones to form, admitting atmosphere and moisture, and regenerating the growth so that an ordinary top-dressing may cause new vigor."

Wool Growing Profitable.

FROM a recent number of the Detroit Free Press, we clip the following:—"The importance of Wool as a staple is but just beginning to be realized among the farmers of Michigan and other States of the West. The repeated failure of the wheat crop in this section of the country, and its low price during an abundant season, have been causes for great discouragement to the agricultural community, and has compelled them to seek for relief from impending ruin, in some other of the gifts which Dame Nature lavishes so bounteously on her industrious votaries. The attention of the farmers of the Northwest having been fortunately directed to the breeding of sheep, the experiment has been found to work admirably, and there has, for the past three years, been a continually increasing clip of wool sent forward to market from the interior of Michigan, in the aggregate amounting to some millions of pounds. The prices, so far, have been higher, more uniform, and better sustained than those of any other product of the farm and, as the Paw Paw Free Press remarks, it is becoming pretty certain that wool is to be, at least, one of the leading agricultural products. The market for this article is very brisk—the manufacturers have not a supply on hand, and importations to some extent have taken place the past season."

Hop-Poles—A Substitute.

THOS. D. ATYLSWORTH, of Herkimer Co., N. Y., (says the Tribune,) has laid the hop growers under great obligation to him for his invention of a substitute for hop-poles, which have been so used up in hop growing districts that they are enormously expensive, and as is well known by all hop growers, the labor of setting a large field of poles every year is very great. This labor may now be dispensed with. Mr. Atylsworth's plan is to set stout posts some six or eight rods apart, in as long rows as the field will admit of. On the top of these posts a wire is drawn, and from it strings are carried to short stakes in the ground by the hop roots. The vines climb the strings readily, and as these give no shade, there is a great advantage gained in this respect over poles. When the hops are ready to pick, the wire, which is attached upon one post to a small iron shaft with a crank, is loosened so that the strings, which have a little wire spring book at the upper end, can be unhooked, and as many strings taken down at one time as the picker desires, and stripped in the field, or severed from the bottom stakes and carried to the barn. A small, cheap cast-iron clamp is attached to each post that holds the wire, so that one space only is loosened at once, and in case of a wire breaking, the vines of that space only will be prostrated. The contrivance is altogether, both in economy and use, an improvement worthy the attention of all hop growers. The same plan will also answer for those who grow Lima beans on a large scale. Just now is the right time to make the needed preparation.

SPECULATION IN CLOVER SEED.—The Cincinnati Price Current says that with the belief that the clover seed crop of last year was a failure, speculators went into the market and purchased largely at high prices. The principal purchases were made at six dollars, but at one time it went up to seven. The bubble soon burst, however, and it is now found that the article is a drug at \$4.75 to \$5, and the stock large. Prospective profits doubtful.

Agricultural Miscellany.

THE WEATHER has been most unpropitious in this region during the past week.—Winter lingering in the lap of spring—to such an extent as to render outdoor operations impracticable. On Friday night Western New York was visited with one of the most severe north-east snow storms experienced for years, making Saturday the most unpleasant day for months. Snow fell to the depth of four to six inches over a large extent of country—from Syracuse to St. Catharines, C. W.—and put a damper on the hopes of immediate progress by cultivators. No special damage was occasioned, however, except in retarding the season and its labors. We trust this will prove a "clearing-up storm"—though succeeded by a heavy rain on Monday night—and that genuine Spring weather will soon prevail.

THAT FOUR-MINUTE CHURN.—In the Rural of the 3d inst., we gave an extract from an article by H. A. COOK, of Columbia Co., N. Y., which spoke of using a four-minute churn, and churning milk "right from the cow," &c. The matter has attracted considerable attention among our readers, and we have at least a score of inquiries about said churn—asking for information as to the facts from any one "posted"—and also in regard to the butter-maker mentioned in the same article. We can neither answer the queries nor give the address of Mr. Cook, but presume the churn alluded to is the same about which we publish an inquiry elsewhere, and that some of our friends will ere long favor Rural readers with definite information on the subject.

THE BEST IMPLEMENTS.—A POWER.—In a recent business letter, A. McNAULT, of Christian Co., Ill., says:—"Will you please name, in the next number of the Rural, the best corn drill (worked by horse)—the best wheat drill—the best combined reaper and mower—the best mower (single machine)—the best reaper (single machine)?" We could easily name a good machine of each kind, but we cannot say which is positively the best. That is a point on which the best judges, practical farmers and editors, honestly differ—and of course it is very difficult to discriminate in many cases, to say nothing of its impropriety in our position. As we have frequent inquiries of similar import, we would refer to the awards of committees at Trials of Implements, Fairs, &c., but more particularly to the testimonials of reliable practical farmers. Many good machines are advertised in the Rural, and frequently with testimonials and references whereby any one interested can easily obtain satisfactory information.

UNION AG. SOCIETY.—Palmyra, N. Y.—The proceedings of the last Annual Meeting, sent us by the secretary, show that this Society "still lives," and is progressing. At the recent annual meeting the following officers were elected:—President—LEWIS SANDRUS. Vice-Presidents—W. P. NOTTINGHAM, Palmyra; Eliab Yeomans, Walworth; Lorenzo Hathaway, Farmington; Russell Stoddard, Manchester; George W. Marshall, Macedon; Elihu Durfee, Walworth; Sam. H. Duol, Ontario. Cor. Secy.—O. H. ROGERS. Rec. Secy.—A. P. CRANDALL. Treasurer—G. W. CUYLER. Directors—B. K. WILLIAMS, of Newark, and J. C. PETTIT, of Palmyra, for the ensuing three years; and Lemuel Durfee, of Macedon, to fill the vacancy occasioned by the death of A. H. COOPER.

AN AG. EDITOR CANNOT.—Brother WELD, of The Homestead, has been presented with a gold-headed cane by an admiring reader, in appreciation of his arduous services, &c., as the letter reads. Mr. W. makes a fine speech—on paper—in reply, showing that the cane is bread and butter in this wise—"The staff is an excellent support for the physical man, but in this connection we are reminded that 'Bread is the staff of life'; apropos: bread and butter is the gold-headed cane." May our contemporary ever be abundantly supplied, and bear his honors becomingly!

"FRANKS OF NATURE" are often reported in the papers, but this one from the Bluffton (Ind.) Banner is decidedly ahead of ordinary specimens:—"On the farm of our old friend, JOHN A. DEAR, are two lambs, which are joined together, their heads being reversed. They are perfect in every respect, with the exception of the connection which holds them together. In sucking they appear to have come to a mutual understanding, and take it one at a time, the other patiently waiting. They follow the dam by going round and round in a circle."

A "MONTHLY JOURNAL of the California State Ag. Society" was commenced in March last. We are indebted to O. C. WHEELER, Secretary of the Board, and also to GEO. W. WHEELER, of Sacramento, for copies of the initial number. The object is to give the proceedings of the Board at its monthly meetings, schedules of premiums offered, and awards made, with lists of letters received, donations to library and cabinet, &c.

IN OFFICE.—R. F. JOHNSTON, of the Mich. Farmer, has been appointed General Superintendent of the Agricultural College Farm, at Lansing, Mich. He accepts, but will retain his connection with the Farmer. Glad of this appreciation of brother J.'s knowledge of "western farming and western interests."

A WEIGHTY CALF.—MR. EDWARD BEMAN, of Livonia, informs us that he has a calf about one month old, which weighed, at the time of its birth, one hundred and thirty-three pounds! The dam is a half-blood Durham, sired by old Splendor. The calf was sired by a Kentucky bred Short-horn bull.

LARGE PREMIUM FOR A STEAM PLOW.—In addition to the premiums of \$2,000 and \$2,500 offered by the Illinois State Society for the best Steam Plow, the Ill. Central Railroad Co. offers \$1,500 for the same object. The suckers are evidently bound to inaugurate steam cultivation, and that right speedily.

STATE AG. SOCIETY'S PREMIUM LIST, &c.—We are indebted to Col. JOHNSON for pamphlet containing Premium List, Regulations, &c., of N. Y. State Ag. Society for 1859. Copies may be obtained at the principal Implement Warehouses throughout the State.

SON FENCES.—Having noticed in some paper a description for building a ditch and sod fence on marshes, by digging two ditches five feet apart and packing the sod and dirt between, I wish to inquire through the Rural if you, or any of your correspondents, have had experience enough in sod fences to vouch for their durability and utility as a fence? Also, the size of ditches in order to get dirt enough to build such fence, fence; and also the cost per rod of building such fence, over and above the common method of ditching?—W. H. CHAFFER, Byron, Sta. Co., Mich., 1859.

THE SOD IN SUBUR.—At an arbitration in my neighborhood it was decided by the Referee that a sound and healthy sheep (Buck) put in with a flock of scabby sheep could not take the disease so as to shed a good portion of his wool and scratch badly in from forty to fifty days, but that it required from six to eight months after taking the scab to effect any sensible injury to the sheep. Will sheep men acquainted with the scab give their opinion and oblige a doubter?—A. TRIPP, Albion.

A GARDEN GATE.

Few things are more annoying than to have garden gates left open, which vagrant cows take immediate advantage of to ravage the grounds, destroying the trees and shrubs, and with them the hopes and the patience of the gardener. This evil is particularly felt in villages and in the suburbs of cities, as we have good reason to know, having suffered in this way many times. We introduce to the notice of our readers a gate which is quite common in England, but which we have never seen in this country, that requires no shutting, and therefore can never be left open, or rather, is always open, and yet is so constructed that no animal can enter.

FIGURE 1.

The engraving, figure 1, shows the gate, which may be of iron or wood. There is just room enough for a person to pass comfortably between the gate and the circular guard. The black lines in fig. 2, show the gate and the guard, the dotted circular line, the swing of the gate, and the straight dotted lines the position of the gate when closed, or forced on either side as far as it will swing. When an animal attempts to enter the gate it is forced in the opposite direction, and ingress is impossible. No animal larger than a small pig could effect an entrance.

UNSUCCESSFUL EXPERIMENTS.

HAVING read a great deal about the superiority of house-ripened pears over those allowed to hang on the tree till they reached maturity, we undertook last year for the first time to ripen, without the aid of sunshine, some large, summer pears, excellent for cooking and tolerable to eat out of hand. The pears were picked after two or three had fallen from the tree from premature ripeness, and were placed in a dry, cool, dark room for two weeks. At the end of that time they were found to be mellow and much juicier than when ripened on the tree, but, oh, how sour!

A lady, a neighbor of ours, a year ago last spring, purchased four cherry trees at the nursery, and planted three of them so near the house that she could easily give them some extra attention, and she determined to do so. Accordingly, having heard and read of the beneficial effect of soap-suds applied to fruit trees, vines, &c., but not having noticed the oft-repeated warning of nurserymen that the cherry is impatient of moisture, with a special dislike to soap-suds, she made a practice of bestowing on each of the trees most convenient to the house, a pailful of that liquid fertilizer, on wash days, and occasionally at other times. The result was, that, in the course of the season, the three potted trees died, while the neglected one lived and flourished.

A few years since chance led us to select a low, moist part of the garden, along the south side of a fence, and considerably shaded by trees, for yellow Antwerp raspberries. The plants grew well, and with no further attention than occasional mulching with chip dirt, cutting out the old canes and shortening in the new ones, produced a good supply of fruit. In the fond hope that a better exposure to the sun might cause them to yield even larger returns of berries, a portion of the roots were removed to a more open and somewhat dryer situation. But no small amount of coaxing has thus far produced from them more than a lean, scraggy growth of canes, with a few berries, not large and fair like those growing on the shaded bushes, but small, dry, inferior specimens hardly worth gathering. Some other roots of the same variety, planted on the west side of the house, on ground that had taken the wash of the house for many years, and is more heavily shaded than the first mentioned situation, make, each year, a fine growth of canes, but bear very little fruit.

South Livonia, N. Y., 1859.

REMARKS.—The pears were perhaps gathered before mature. Those that dropped may have ripened prematurely from being stung. Perhaps, however, this cooking pear would be best ripened on the tree, but our readers must not conclude that this is generally the case with pears. Apples are bad for cherry trees, and soap-suds may be also. Good gardeners we know would say, give raspberries a free open exposure; make the soil deep and rich, and you will not fail to grow good fruit and plenty of it. This is true, but yet we like to grow them where they are a little shaded, as, for instance, on the north side of a fence. In this situation they suffer little from the coldest winters, and produce a crop of fair fruit.

IMPROVING COMPOSITION.—I see by the RURAL NEW-YORKER many kinds of composts. I have tried many of them, and find that the best I ever used is to take loam and manure, mix them about equal parts, and mix with it some water enough to make a hard cake, and apply while wet. It will form a hard crust, and will stay as long as required. No other things are needed for the birds to pull at, and the grafts.—R. T. G., *Proctor, Suff.*, 1859.

KILLING OF PEACH BUDS BY COLD.

MEANS. EDS.—Your correspondent L. B. MANLY, some time since stated that no conclusion could be arrived at with regard to the laws that govern "Meteorologic Physics," and felt a little vexed at the prospects of his peach crop. Now, (with your permission,) I will suggest to him the laws that seem to me to hold the reign of life and death over the peach buds. But first, does he know that the peach buds were sound and hale up to the notable 10th of January? With us we had had a warm, growing fall up to the 21st of September, without any frost. But on the morning of the 21st, we had a killing frost that destroyed the vitality of the leaves while in a growing condition, and the sap, instead of going to the leaves, was forced into the buds in an unnatural manner, and the weather soon became warm again.

In that condition the first cold weather sufficient to perfectly freeze the buds destroys its vitality. But, when the fall is dry and gradually cools down, and the first frosts are light, nature has time to make due preparation for the coming winter, and with the buds thus prepared, I do not believe that all the cold of the Arctic regions will destroy them, provided it be not continued long enough to dry out and season the wood of the twigs. For trees that are winter-killed are only season-killed,—and if the expansion that takes place at the freezing point does not destroy them, all the additional cold that takes place after that will not. On Thursday, the 2d week in January, 1857, the thermometer stood 20 below zero, and the following fall we had the largest peach crop that we had for many years.

S. G. MANCHESTER.

Wallville, Luzerne Co., Pa., April, 1859.

REMARKS.—There is something no doubt in this theory, but we cannot believe that if a peach bud is not killed by simply freezing, that it will endure any amount of cold, for previous to the few extreme cold days in January the peach buds were all good, although we had severe frost, but after this the greater part were found to be dead. Other winters we have watched the peach buds and found them sound, until, perhaps, in February, or even March, although the thermometer several times had been below zero, when it would fall to 15 or 18 below, continuing at this stage only a few hours, and the buds would be destroyed.

Inquiries and Answers.

GRAPES FOR ILLINOIS.—Can grapes be grown with success in the State of Illinois; and if so what part would you recommend as best for the vineyard cultivation of the grape?—W. D., *Paris, O.*, 1859.

ONLY the most hardy varieties can be grown in the northern part of Illinois. In severe winters the Isabella is killed to the ground in the neighborhood of Chicago. Southern Illinois, we have no doubt, is well adapted to grape growing.

THE MAZZARD CHERRY.—I have MAZZARD Cherry seedlings three years old which I procured with intent to bud them, but failed in getting the buds to grow, having tried them two seasons with but little success. (a) Can I part the roots and graft, as is usually done with apple seedlings, and be likely to succeed? (b) Or, if transplanted as they are, would they be of any value? Is the Mazzard of the heart variety? Is it sweet or sour, large or small, red or black? Does the seed produce a variety of sorts? Do the trees attain a large size, and are they capable of enduring cold winters? Please answer through the RURAL and oblige a subscriber.—J. McCune, *Auburn, Ind.*, 1859.

(a) You can graft the Cherry as it grows, in the usual way, but should not take it up or cut or part the roots as is done with apples in the root-grafting. It should be done very early in spring.

(b) The Mazzard is the wild species of Europe, from which all the Heart and other sweet cherries originated. It grows rapidly and in a few years makes a very large pyramidal-headed tree, perfectly hardy. The fruit is small, roundish or oval heart-shaped, flattened on the sides, when ripe jet black. The flesh is soft, melting, sweet, with abundant juice, a pleasant sprightly flavor, but a little bitter. We like the old Mazzard with which in our boyish days we used to blacken our face and fingers. Many a bushel have we eaten of them.

FRUIT GROWING IN MICHIGAN.—Wishing to engage in the fruit business in the West, permit me to inquire in regard to climate, soil, and probabilities of success, were one to locate on the eastern shore of Lake Michigan? I would like to make the following inquiry. What would be the influence of the lake winds in preserving fruit buds, and how far in country would this influence be felt? Which would be best, the soil of opening or timber? Does fruit do well as far north as Grand River?—A. S. S. *Michigan, Macdonald, N. Y.*

ONCE when on a trip West, we observed very fine peaches in the Chicago market, and on inquiry were informed that they came from Michigan, on the Eastern shore of the lake, and that the supply from that quarter seldom failed. Will not some of our readers in this section answer the inquiries of "A Subscriber"? Large bodies of water ameliorate the climate, and of course the further from the water the less the influence is felt, but just where an appreciative influence ceases to be observable we cannot say.

POUND PEAR, &c.—(a) I send you a scion from a pear tree which I received under the name of Pound. I think from its stout, stubbed growth it is a mistake. If you can tell me the correct name, I would be thankful. (b) Also, what time to shorten dwarf pear trees? (c) Will it hasten the fruiting of standard apple trees to shorten the last year's shoots, and if so, at what time should it be performed? (d) I have two or three hundred dwarf pears one year from the bud—would it be better to plant in the place for the orchard, or to set them out and cultivate in a nursery this season? (e) Have any of the RURAL readers ever tried the English Hawthorn for dwarf pears?—E. L., *Hingham, Ill.*, 1859.

(a) We could not undertake to name a variety from an inch or two of scion, and badly shriveled at that. (b) Dwarf pears may be pruned any time after the severe frost of winter is over. They may be pruned here any time between the fall of the leaves and spring growth. (c) Apple trees that are disposed to make a rank growth of wood without making fruit buds, may often be rendered fruitful by a summer pruning in June, or early in July. By removing so many of the leaves the tree receives a shock; its luxuriance is checked, and the

buds that would have made wood, if the tree had not been pruned, are changed to fruit buds.—(d.) One-year pears we would plant immediately in the orchard or garden, where they are to fruit.—(e) Cut them back well, give good cultivation, and they will soon make fine trees. (f) It is useless to try thorns of any kind with pears while we have good pear and quince stocks.

ROOT GRAFTING, &c.—(a) Will you inform me through the columns of the RURAL the proper mode of root grafting apple trees? (b) Can any other trees be successfully root grafted? (c) I have a number of dwarf pear trees growing. On some of them the leading shoots, last summer, grew two and a half feet, while others grew not over several inches. Now, how shall I prune them?—G. A. *Roxbury, Pa.*, 1859.

WHEN is the best time and what is the best method of root grafting? (d) Are the roots of the thorn bush as good as apple roots to graft apples into? (e) Which is the best, grafting or budding into the wild plum?—D. B. P.

(a) Seedling stocks of one or two years old are used for root grafting; if they have made a fine growth, so as to be about three-eighths of an inch in diameter, they are large enough. It is done in the winter, and then the grafted plants are preserved in boxes in the cellar, for spring planting. The graft is made at the collar, when the root is used whole, though it is quite common to cut a good root in two or more pieces, grafting a scion on each piece. A good deal has been written and said against this practice, though we know of no facts showing that it is in any way objectionable. The root used is left about four inches long, the long tap root being removed, and any long fibres, as shown in figure 1. The grafter then makes a

smooth, even, sloping cut, an inch long, upwards on the collar of the root, A; and in the centre of this cut, he makes a slit or tongue, B, downwards. The scion, which should be three or four inches long (fig. 2), is cut on the lower end with a sloping cut downwards, and similar in all respects to that made on the stock; a slit, or tongue, is made in it upwards, B, corresponding, also, with that on the stock; and they are then neatly fitted together, the tongue of the one within the other, (A, fig. 3,) and the inner barks of both placed in close and perfect contact, at least on one side. The fit should be so complete as to sit close and firm in all parts. It is covered with a piece of cloth or paper saturated in grafting wax, and the work is done. Our illustration is from BARRY'S Fruit Book.

(b) Pear stocks may be successfully root grafted, though the pear is more generally propagated by budding, and with other fruit trees it is seldom practiced.

(c) It is difficult to give directions for pruning in special cases, without seeing the trees; still we would say, cut back the most vigorous shoots on your trees to about one-half their length; those which made but a few inches of growth will require to be cut back only to a vigorous bud. The form of the tree, however, should be considered in all those operations.

(d) Don't bother yourself with thorn roots, except for amusement.

(e) The plum is usually propagated by budding, but where the stocks are too large for budding they may be grafted, very early in the spring.

BLASTED APPLE.—Being a reader of your paper, permit me to make an inquiry, which you, or some one of your correspondents, may be able to answer. I have an orchard of ninety trees; among them is a tree that has borne, till about three years ago, good fair apples. Since that time, when grown to about the size of a walnut, they wither and dry up, some falling off, others remaining on the tree until the next season. Now, I wish to know the cause and the remedy, if there is any. The apple has been pronounced by good judges to be one of the best of fall apples. I know of no name. I have manured the tree and applied ashes leached and unleached, to no benefit. The tree is well trimmed and is thrifty. I would not take fifty dollars for the tree if it was as it used to be.—LYMAN ROBINSON, *Popple River, N. Y.*, 1859.

ONION GARB.—Who knows of a way to protect onions from the grub that is so badly injuring this crop in many parts of the country? We saw a statement some time since that guano was effectual, but this has been denied. Salt, too, has been recommended. We wish experience on this point for the benefit of several readers.

CURCULIO REMEDY.—A correspondent of Quincy, Illinois, writes that he is confident he has found a remedy for the curculio, and if, after another season's trial it proves effectual, will make it known.

CHRONOMETRICAL THERMOMETER.—A new thermometer, very valuable to horticulturists, is now made in England, called the Chronometrical Thermometer. It consists of a good eight-day clock, showing the time in the ordinary way, and connected with this clock is a newly patented thermometer, in which glass and quicksilver are dispensed with. It writes down the temperature of the atmosphere on a slip of paper, and when placed in a hot-house, forcing-house, or conservatory, &c., supplies a valuable record of the temperature, with all its variations, showing the time when any change took place, and how long such change continued. The proprietor, though absent for the whole day, can learn every change that has occurred, and may thus be able to account for things which, but for this knowledge, might appear mysterious.

THE NEW NATIVE GRAPES.

MEANS EDITORS.—Will you allow me to offer a few explanatory remarks through the RURAL, in relation to the Franklin Grape? As I am not in the sailing line, you will at least give me credit for honesty of purpose—no self-interest to induce me to "puff." You warn the gentlemen "not to spread it on too thick," and seem to think "that if one-half that is said of the new seedling grapes is true, in a few years we shall have the most delicious fruit the world ever saw or tasted, in the greatest variety and abundance." (The Italics are mine.) Now, in reading both articles and your editorial remarks, we cannot help but say,—the Editor is laying it on rather thicker than either of the others, or than their remarks will warrant!

As my name has been used in this connection, I feel that some explanation is due. That any of the new seedling grapes will surpass "anything the world ever saw," we do not even hope for; but that they will surpass all the old native varieties, we honestly believe, otherwise there would be no progress,—or that we shall produce native seedlings superior, or even equal, to a Hamburg, a Chasselas, or Muscat, we dare not even hope. The Franklin is not equal to the Catawba, where the latter comes to full perfection, either in size or quality; nor is it equal in size to the Isabella, though of better flavor. What makes it valuable is its earliness, hardiness, freedom from all disease, capable of withstanding heat, drouth, cold and mildew, much better than the Catawba or Isabella, and always bearing fair crops of good grapes, while the other two rarely, with us, perhaps one year in ten produce a crop in tolerable perfection. What we do claim for the Franklin, is its ripening before any others,—its hardiness and entire freedom from disease,—the prospect of improving on it from its seedlings, its promising qualities for vineyard purposes and the making of wine, (its fruit and juice being sweet, will require less sugar, if any, to turn the must into wine,) and as a reliable grape for all seasons and soils. We honestly believe its superior is not yet known to the public. The general appearance of the plant, vines, leaves and fruit, so closely resembles the Clinton, that one might be taken for the other by the eye, but when the palate is brought into requisition, the difference is soon detected—the Franklin being sweet, while every one knows the Clinton is too acid for a table grape. It is yet quite scarce, Mr. Hoass being the only person who has plants for sale, though several other nurserymen now have it under propagation, and will soon be able to supply all demands. Columbia, Pa., April 11, '59. J. B. GARDNER.

We are pleased with the above, because our correspondent has acted in accordance with the advice we gave, and compares the Franklin grape with the Isabella and Catawba, so that we are enabled to judge of its character. In answer to the charge that we put a construction upon the descriptions of Messrs. HOASS and MILLER, not warranted, we will reply in a few words. The Franklin Mr. MILLER pronounced "excellent." This is not very definite, but is explained by Mr. GARDNER, that it possesses all the hardness that can be desired, is early, and of better flavor than the Isabella. This is a pretty exalted character; but Mr. MILLER said a seedling from it, which had been named America, is "infinitely superior to the Franklin." Now, the Franklin is of better favor than the Isabella, and the America infinitely superior to that. If this is not setting it up, we don't know the meaning of words. Could more be said of the best foreign grape? We know words are used carelessly, but they should not be so used in describing fruit.

We have the satisfaction of knowing that our course on this subject is warmly approved by many of the most intelligent horticulturists of the country, and the most extensive propagators of the new native grapes. Let the wild, spread-eagle style of description continue and become general, and the people will soon believe the whole thing a humbug. We are anxious that our readers be not misled, and shall do all in our power to prevent such a result.

HORTICULTURAL IMPROVEMENTS.

MEANS EDITORS.—As you have ever evinced a deep and lively interest in all rural progress, and are always ready to chronicle the same, I will call your attention to some important improvements in gardening, now in progress in the beautiful village of Le Roy, Genesee Co., N. Y. A. F. BARTOW, Esq., is laying out about three acres in lawn, dwarf pear orchard, kitchen garden, &c. The lawn is to be planted with ornamental shrubs, trees, &c., and the carriage-road and walks well made.—When completed, this will be one of the most desirable places in the vicinity, as it commands a fine view of the surrounding beautiful and fertile country. J. R. OLMESTEAD, Esq., has a neat Gothic house, with several acres attached, which he has commenced improving. About two acres immediately around the house, are to be improved, and principally devoted to lawn and pleasure grounds, with winding gravel walks, flower beds, summer houses, and other adornments. The kitchen garden and orchard, however, are not neglected. H. W. HASSELL, Esq., is about to surround his Gothic cottage with a fine lawn, with flower beds on the borders of the walks, and decorated with the finer kinds of ornamental trees and shrubs. The plan which he has adopted also provides for a picturesque dwarf pear orchard, circles about four feet in diameter being cut in the turf for the trees. Other improvements are planned, or in progress, but I only mention these to show that advancement is the order of the day in this pretty rural village, and as an inducement to others to do likewise.

W. WEBSTER.

PEAS IN CHINA.—The Mark Lane Express, in an article on leguminous seeds, says:—"The Chinese make cheese from the casein of peas. The peas are boiled, and coagulated by a solution of gypsum. The cheese gradually acquires the taste and smell of milk cheese. It is sold in the article of food for cities, and forms a considerable article of food for the people. There is a large article of food for China for pressing oil from, and in which an enormous trade is carried on at Shanghai and the Northern Chinese ports, the cake being afterwards largely used for manure." Perhaps it may be largely used for the oil or cake—the subject of its value and uses is at least worthy of an examination.

ICE CREAM, APPLE CUSTARD, OMELET, &c.

MEANS EDITORS.—I noticed in a late RURAL a request that some of your readers would give a recipe for Ice Cream. Here is mine, together with some other excellent recipes:

ICE CREAM.—Three quarts of milk; 3 of cream; 3 eggs; 1½ lb. sugar; 8 tablespoons starch; 2 of lemon. When the milk and cream are at the point of boiling, stir in the eggs, sugar and starch—when nearly cold, put in the lemon and stir it well.

OMELET.—Beat 1 dozen eggs as for custard, add 1 cup of thick sweet cream, and a little salt; have your spider well buttered, pour in your mixture, set over a slow fire, stirring it continually until it thickens. Pour it immediately into a deep dish.

SOFT GINGERBREAD.—One teacup of butter; 1 of sugar; 1 tablespoon of ginger; ¼ teaspoon of cloves; 1 of cinnamon; ¼ pint of molasses; 1½ pints flour; 3 eggs; ¼ pint sour-milk; 1 teaspoon soda. Improved by 1 pound raisins.

CLOVE CAKE.—One teacup of sugar; 1 coffee-cup molasses; ¼ cup of butter rubbed with the sugar; 3 eggs; 3 cups flour; 1 coffee-cup raisins; 2 teaspoons cinnamon; 1 of cloves; 1 nutmeg; 1 teaspoon soda dissolved in ¼ cup milk.

GOLDEN CAKE.—Yolks of 14 eggs; whites of 2; 1 lb. of flour; 1 lb. sugar; ¼ of butter; ¾ cup of sour cream; a little soda.

SILVER CAKE.—Whites of 14 eggs; 1 lb. sugar; 6 oz. butter; 12 oz. of flour.

DATTON CAKE.—Two cups sugar; 1 of butter; 5 eggs; 3 cups of flour; ¼ cup sweet cream; 1 teaspoon cream tartar; ¼ teaspoon soda, nutmeg or mace.

POUND COOKIES.—One pound white sugar; 1 of butter; 3 eggs; ¼ cup of sour milk; 1 teaspoon of soda.

ANOTHER.—One egg; 2 cups white sugar; 1 cup cream; a small piece of butter and a little soda—season to your taste.

APPLE CUSTARD.—Take half dozen very tart apples, halve them, peel and core, cook them until soft in ¼ cup water, then lay them in your pudding dish and sugar them; beat 6 eggs; add 4 spoons sugar; 8 pints sweet milk; pour it over the apples, and bake half an hour. Eat with a little butter. Willow Brook, N. Y., 1859. MARGARETTE.

CAKES, COOKIES, &c.

EDS. RURAL.—Being an interested reader of your estimable weekly, and being assisted in my domestic affairs by your "Domestic Economy," I thought I would lend my feeble aid in sending a few recipes which I know to be good.

FRUIT CAKE.—One lb. of flour; 1 lb. fruit; 1 lb. butter; 10 eggs; 1 teaspoonful saleratus; ¼ cup of sour milk or buttermilk.

RAISIN CAKE.—One cup new milk; 1 teaspoon saleratus; 1 large cup of sugar; 2 eggs; 3½ cups melted butter—add spice and citron to taste. Bake in loaves.

DROP CAKE.—To 1 pint of cream put 7 well beaten eggs, a little salt; add flour to make a thick batter. Bake in small cakes fifteen minutes—to be eaten warm.

COOKIES.—One cup butter; 2 cups sugar; 1 cup cold water; ¼ teaspoon saleratus; 2 eggs—flour enough to roll.

CREAM CAKE.—One cup cream; 1 cup sugar; 2 cups flour; 2 eggs; 1 teaspoon saleratus—flavor with lemon.

SOFT GINGERBREAD.—One cup molasses; 1 cup sugar; 1 cup buttermilk; 1 egg; 1 teaspoon saleratus; flavor with cloves—mix pretty thick.

HARRISON CAKE.—Beat light 3 eggs; add ¼ lb. of sugar; 1 tablespoon of butter; ¼ teacup sweet milk; ¼ teaspoon saleratus; a little salt; ¼ grated nutmeg; flour enough to make a smooth batter—beat till it rises, and bake in a quick oven. Henry, Marshall Co., Ill., 1859. JULIA.

REMEDY FOR CONTRACTED CORDS.—I saw an inquiry in your paper of the 19th ult., for a remedy for contracted cords, from a Farmer's Daughter of Chemung Valley, N. Y. I will send one that I know is good, from experience. I broke my thigh and also my jaw in three places, and my collar bone and three of my ribs, which confined me to my bed for five months, and just about the third time of getting up I met with an accident by falling and breaking it over again, which confined me four months more. But to come to the point, I had no use of my limb for 12 months, so that the chords became contracted. I tried everything that I could obtain and the only thing that did me any good was this:—1 oz. olive oil; 1 oz. gum of camphor; 8 ozs. oil of origanum. This must be rubbed in close to the fire. It costs 50 cents for the whole.

Can you inform me where the Gold Chain Tree can be obtained, &c.—T. R., *Florida, March*, 1859.

THE Golden Chain, or Loburnum can be obtained at almost any nursery where ornamental trees are sold.

ON the subject of "Bites and Stings," Hall's Journal of Health has an item which may be important for some.—As many of our readers are preparing to travel or go in the country for the summer, it may be useful to remind them that an ounce vial of spirits of hartshorn should be considered one of the indispensable, as in case of being bitten or stung by any poisonous animal or insect, the immediate application of the alkali as a wash to the part bitten, gives instant, perfect and permanent relief, the bite of a mad dog, we believe, not excepted; so will strong ashes and water.

SCOTCH STUFF put on the holes where crickets come out will destroy them.

THE ANGELS ARE NEAR.

BY A. T. SMITH

I see the forms of angels, mother,
Hovers round me now,
And a joyous smile of welcome seems
Enfolding each fair brow;
A harp is in each hand, mother,
And as they sweetly play,
The rapturous music seems to drink
My feeble life away.

I know I soon must go, mother,
To that happy land,
Where, free from worldly care and pain,
I'll join this angel band;
Then do not weep for me, mother,
Soon you will meet me there,
Then all those heavenly joys above
Together we will share.

O, bear my love to Willie, mother,
An I speak these words for me;
My spirit will ever be near to him,
A star on life's dark sea.
Say I whisper kindly to him, mother,
And my spirit will smile as sweet
As I did on the day I gave my heart
While we sat on the garden seat.

Here, take me in thy arms, mother,
And press this hand in thine,
And in thy kind and soft embrace
Let me my life resign.
The angels beckon now, mother,
And sweeter sounds the lay,
And sweeter smiles the angel band—
I go with them away.

Hankin, Mich., 1859.

Plain Talks to American Women.—No. 9.

BY MRS. M. P. A. CROZIER.

"Blessed are the pure in heart, for they shall see God."

WHAT Christian mother, in looking abroad upon the impurity and degradation that exists in the world, but feels deeply the danger to which her offspring are exposed, of having their young hearts sullied by contact with vice? What one but would, from the depths of her maternal nature, cry aloud unto her God, "Unfold and preserve within my child's soul the pure blossoms of virtue!"

And yet Christian mothers often have occasion to weep over some lost lamb of the fold, and their gray hairs go down in sorrow to the grave, because of the crying of a child of many prayers. How is this? Is God unfaithful to his promises? No, never! It is still true as of old, "Train up a child in the way he should go, and when he is old he will not depart from it." There must, then, be something deficient or wrong in the training; some little key must have been unskillfully touched or neglected, that thus the harmony of life is spoiled. The sweet soprano of prayer has musically ascended to heaven, mingled, perhaps, with the soft alto of tears, but where was the deep-toned bass of watchfulness? It is sad, mother, that you should have forgotten that, without this accompaniment, the music would be imperfect! It is sad that in your ignorance you should have prepared a soil too favorable to the growth of those unholy passions which have now destroyed your peace, and that in their first appearing you should not have snatched them from the garden of your child's heart.

It is undoubtedly true that the children of some parents inherit a moral obliquity, no less than those of others inherit physical degeneracy. This may, perhaps, as often result from ignorance of marital law as from direct vice, and in still further ignorance may be often found an *alma mater* that nourishes it into a rank growth of poison. By gross and luxurious habits of living, such as are too prevalent in our times, are the passions often stimulated to a morbid growth. Perhaps it were not too much to say that impurity is often the out-growth of physical disease. This being true, it would follow that education and other things being equal, the most healthy child would be the least liable to the contaminations of vice. It may be from neglect in this very particular that many who have been very faithful in imparting moral and religious instruction, have failed to see the desire of their hearts, that their children should lead pure and virtuous lives, realized. With one hand they have destroyed the temple of beauty which, with the other, they have been endeavoring to construct. And, on the other hand, it perhaps as frequently happens that a child's bodily health becomes seriously deteriorated by vicious practices before the parent is aware of the means by which the mischief is being wrought. Very few parents have any idea of the dangers to which their little ones are daily exposed. They send them to school in the morning with little thought of the poison that may be instilled into their hearts before evening. They are often trusted, unguarded and unconstructed, in the society of unprincipled and ignorant hired help, till, alas! they become too well acquainted with the wickedness of the wicked. O, parents, would you have your children pure and good, expose them as little as possible to the corrupting influences of evil society. Know what their private habits are, and be instant to correct anything dissonant with purity. Impart sufficient instruction to guard against evil.

Perhaps one of the most efficient means of preserving the young from corruption is the cultivation of an affectionate intimacy between parent and child. There should be a mutual and endearing confidence. The son and daughter should be encouraged to pour freely into the bosoms of the parents their secret thoughts and feelings, their purposes and desires, assured that they will find there that sympathy and aid which they need.

What more lovely, what has a greater tendency to promote the happiness of the family than this common out-pouring of sentiment and feeling? False impressions are thus eradicated, false habits corrected, and the soft dews of wisdom distill as gently into the heart of childhood as the night-tears upon Hermon. If the parents' souls be endued with the purity of the gospel, it were but natural to expect, under circumstances like these, a beautiful unfolding of pure principles in the hearts of their children.

Besides the influences of which we have spoken, the direct authority of God's moral law should be brought to bear upon this subject. The young should be taught how odious in the sight of a holy God is everything unclean, how it is condemned by his word, and how impossible it will be for anything that defileth to enter into the bright home of the future where "the pure in heart shall see God."

A false delicacy should not cause a neglect of duty in this matter. The enemy is ever busy sowing and cultivating tares. Let Christian parents be as vigilant and faithful in broadcasting and nourishing the seeds of truth, and in rooting up whatever is obnoxious to their growth, and a golden harvest may be anticipated, sheaves fully ripened for the garner of God.

HOW SHALL WE AMUSE THE CHILDREN?

To amuse the little ones, the children, successfully, is no small or easy task. To simplify our words and actions, so as to meet the comprehension of a child, requires a better knowledge of ourselves, and of nature, than most people possess.

How often we hear it said—"Such a one is just fit to play with and amuse the children;" and their minds and capacities are held in comparative insignificance and contempt, while in fact their mental capacities are superior to those who thus hold them in ridicule. The truth is, human nature is prone to undervalue qualities or capacities which are beyond our reach, or ambition. A weary, ever-plodding mother or sister may bend her energies, and no matter how worn, or disgusted with the toil and worry of petty, endless, trivial cares, the children hang around her, when at last she has a long-coveted moment to sit down. Mother must tell the stories, or explain the pictures, or mend the toys, or in some way or other devise ways and means for the time to be spent by these restless, ever-active children. And what of it? Nothing—only those people who are supposed to have no brains, and to have been made on purpose to fritter away whole lives in the constant employment of the merest trifles,—viz., women—are not, after all, the most enviable people in the world. To be useful, even in small things, is pleasant—but after you have struggled to bring your mind to the faithful performance of little duties, to have your reward in the mere assertion—"O, it is nothing for her; it just suits her—all she is good for." Some people like to do the great things, and have the name of it, because they well know it requires the stronger mind, and the greater effort, to perform small things, well and constantly.

Western New-York, 1859.

A FRENCH WOMAN AT HOME.

Six helps to cook the dinner she has bought—for servants are wasteful with coal, and she knows to an inch how little she can use. In that marvelous place, a French kitchen, where two or three little holes in a stove cook such delicate dishes, and perform such culinary feats as our great roaring giants of coal fires have no conception of, she flits about like a fairy, creating magical messes out of raw material of the most ordinary description. Yes, though a lady born and bred, refined and elegant, and agreeable in society, a belle in her way, she does not think it beneath her dignity to lighten the household expenses by practical economy and activity. The dinner of a French family is cheap and simple. There is always soup, the meat of the stew pan—sometimes, if not strict in expenditure, another plate of meat—generally two vegetables, dressed and eaten separately, and sometimes (not always) a sweet dish; if not that, a little fruit, such as may be the cheapest and the ripest in the season. But there is very little of each thing, and it is rather in arrangement than in material that they appear rich. The idea that the French are gourmands in private life is incorrect. They spend little in eating, and they eat inferior things; though their cookery is rather a science than a mere accident of civilization. At home, the great aim of the French is to save, and any self-sacrifice that will lead to this result is cheerfully undertaken, more especially in eating and in the luxury of idleness. No French woman will spend a shilling to save herself trouble. She would rather work like a dray-horse to buy an extra yard of ribbon, or a new pair of gloves, than lie on the softest sofa in the world, in plectid fine ladyism, with crumpled gauze or bare hands.—*Lady's Treasury.*

HENRIETTA OF A QUEEN.—Maud, surnamed "The Good," daughter of Malcolm Canmore, King of Scots, and wife of Henry the First, King of England, was so affable, pious and humble, that she condescended to relieve the poor with her own hands, dress their sores, and wash their feet; and, being reprimanded for it by a courtier, as not agreeable to her royal dignity, she made this answer:—"That she followed the example of our blessed Savior, and the precepts of the Gospel; and that the brightest jewel in the crown of majesty, was affability and courtesy."—*Noble Deeds of Women.*

THE MOTHER.—Young man! Thy mother is thy best earthly friend. The world may forget you—thy mother never; the world may willfully do you many wrongs—thy mother never; the world may persecute you while living, and when dead, plant the ivy and the nightshade of slander upon your grassless grave—but thy mother will love and cherish you while living, and if she survives you, will weep for you when dead, such tears as none but a mother knows how to weep. Love thy mother.

Ban temper is more frequently the result of unhappy circumstances than of unhappy organization.

LETTERS TO A BEREAVED PARENT.

BY JAMES EVELL LOWELL.

When on my ear your low was knelled,
And tender sympathy upbraid,
A little sill from memory welled,
Which once had seethed my bitter third:

And I was fain to bear to you
Some portion of its mild relief,
That it might be as healing dew
To steal some fever from your grief.

After our child's untrodden breath
Up to the Father took its way,
And on our home the shade of death
Like a long twilight sad'ning lay;

And friends came round with us to weep
Her little spirit's swift remove,
This story of the Alpine sheep
Was told to us by one we love:

"They, in the valley's sheltering care,
Soon crop the meadow's tender prime,
And when the sod grows brown and bare,
The shepherd strives to make them climb

"To airy shelves of pastures green
That hang along the mountain side,
Where grass and flowers together lean,
And down through mist the sunbeams glide.

"But naught can tempt the timid things
That steep and rugged path to try,
Though sweet the shepherd calls and sings,
And seared below the pastures lie:

"Till in his arms their lambs he takes,
Along the dizzy verge to go,
Then, heedless of the rift and breaks,
They follow on o'er rocks and snow.

"And in those pastures high and fair,
More dewy soft than lowland mead,
The shepherd drops his tender care,
And sheep and lambs together feed."

This parable, by nature breathed,
Blew on me as the south wind free,
O'er frozen brooks that float unbreathed
From icy thralldom to the sea.

A blissful vision, through the night,
Would all my happy scenes away,
Of the Good Shepherd on the height,
Or climbing up the stony way,

Holding our little lamb asleep;
And, like the burden of the sea,
Sounded that voice along the deep,
Saying, "Arise and follow me!"

Choice Miscellany.

Written for Moore's Rural New-Yorker.

OUR ACADEMY.

METHINKS this is the natal day of many a soul-stirring poem, for its serene loveliness cannot but stir the very depth of that nature-worshipping wonder—a poet's heart. The sparkling emeralds with which mother Earth is decorating her russet robe, the bright blue sky, the trilling of robins, and even the little birds on the hazle boughs, are poems of themselves.

Let us stroll away and read them, not with our optics only, but, forgetful of self, send our hearts to revel in them, for, if we read aright, we shall learn that they have, like the fabulous fountain sought by the Spaniards of old, the property of restoring a vigorous youth.

Let us take the path that leads toward the old academy, for it is pronounced by "sentimental young ladies" of Oakwood, "decidedly romantic." True, a little way it is sort of common-place, but here it improves, being environed by majestic old oaks whose branches seem to be interwoven, forming a beautiful arch overhead. But yonder appear the walls of Oakwood's time-honored hall of learning. The situation is picturesque, is it not? A pleasant eminence overlooking the village. But the most attractive feature is the grove on the south, with its inviting seats, whose hospitality we will not scorn, since we may gain wisdom from the "silent teachings" of the time and spot. For our academy, "if walls might speak," would tell us touching stories of the past. But Memory has diligently garnered them in her store-house—let us ransack her homely treasures.

Our remembrance of the "first teacher" is imperfect, yet his very name inspires us with a sacred awe, for older brothers and sisters have taught us to thus revere it. Very often, as in the twilight hour, old-time scenes are revived in their minds, they repeat to us kind words of admonition which were wont to fall from the lips of that never-to-be-forgotten teacher, as guiding his pupils in the path of knowledge he bade them look upward for light which never fails. For he was a young man of eminent piety, who guarded the attainments of those entrusted to his superintendence, as one who must render a "report of progress" at celestial courts. We can trace the origin of many a career of usefulness to germs of right implanted by his careful hand, and nurtured by his prayers.

But his holy mission was soon accomplished. One morning in the spring-time we placed our childish hands upon his cold brow, beautiful in its sad repose, and, though we could not comprehend why he slept so long, there was a deep void in our hearts when we were told that we should never hear his voice again. Even now the sages of Oakwood speak in saddened tones of that first teacher—of the good he would have done, while the young dwell with earnest gratitude on that which he did not leave undone.

Like that of others, the government of our academy is necessarily an absolute monarchy, and the next who seized the sceptre was one fully competent to quell all rebellious subjects, and preserve a general good humor throughout his dominion—an energetic, resolute young man, and very mirthful. Pursuing an independent, manly course of action, he not only gained the esteem of his pupils, but, what subsequent teachers can testify to be of exceedingly difficult attainment, the co-operation of the good people of Oakwood in the advancement of his students. But he, too, bade

us farewell, for Oakwood had become to him the burial-ground of earthly hopes, the dreary resting-place of his beautiful bride.

So it seemed we were fated to a constant change of preceptors, and we were now treated to an entirely original character in the person of a middle-aged minister, with flaxen hair, blue eyes, and a most ludicrous physiognomy. A "perfect whirlwind" the youngsters termed the bustling Divine. Under his jurisdiction we made rapid advancement, for scores of school books were "completed," by those who had heretofore been entire strangers to the latter half of books to which they were introduced years before. And you have not forgotten his custom of fumbling nervously at every recitation the pages yet to be glanced at ere we should have the intense pleasure of saying adieu to the musty text-book.

A very exalted opinion of himself had our clerical teacher. But we would not detract from the intrinsic excellence of his character, nor depreciate the great assistance he rendered to the growth of Oakwood, for perhaps it is to his influence that we are indebted for the new church and stores erected after his arrival among us, and the neat, orderly appearance of our village. But, after advancing those under his guidance a long way up the "fearful hill," in which arduous task he passed several years of sincerely earnest labor, he delivered his farewell address to a tearful audience, for he was not unloved, and we spoke another goodbye.

A few weeks before there was a solemn gathering at the old parsonage, and we followed to the tomb the gentle form of her who still lives in the hearts of Oakwood's people. Methinks "all hearts did pray God love her"—our minister's wife—and now we regard, with a holy affection, the pure spirit above. A bitter adieu to each who held sway in our academy-world, we seem to have been destined to speak. Tears will come as we think of him we next received to our school-room, for, one short month after speaking the word of welcome, we gathered an afflicted band at the grave of the teacher, around whom the tendrils of our young hearts had begun to cling.

The students who have assembled here season after season, are scattered now. You remember the sweet voices of those two sisters which our music teacher prized so highly. They write that they carol as freely now in their homes of the far west, though their song is oftener "lullaby" than those we used to sing. Some the angel of death long since claimed, and "bore over the river." Others are bright stars in the crown of honor, which we award to our Academy, for, though she be the humblest of the sisterhood, we think she has whereof to boast. Memory, in her faithful record, has inscribed the names of young men who gathered gems of knowledge within her walls, and unsatisfied, stepped higher, even into the temple wherein are garnered the deeper treasures of science. They came forth enriched, and the jewels they bore thence, now shed a glorious radiance along their pathway.

Others have gone from the old Academy into Nature's great school-room, and now their broad acres and beautiful homes testify that they are apt pupils. The teacher's ranks have been reinforced by others who bore their regalia from our Academy. Indeed, this venerable institution has supplied competent occupants of nearly every honorable station, and though it has not even a name among the seminaries of our land, how pleasant a field it presents for the study of character—what touching, yet profitable lessons, we might learn from the pages of its history. But it is most solemn to meditate upon the influence which even in its insignificance, is emitting to the world; Though we smile at the thought, still if we ponder a moment we are convinced that there is much of importance attached to the characters of those it has sent forth into life's great conflict. None will be idle. The bearing of each, even the least, will affect the conquest to be gained. Let us trust they will all do battle under the "banner of Right," that they may share the glory of a victory over Error, and you, dear old Academy, be able to render a worthy account of your labors.

Oakwood, Mich., 1859.

AMY SUMMERS.

A NEWSPAPER EDITOR must, like the poet, be born to his calling, as, in the majority of instances, no amount of training will fit a person for such a post, unless he have a natural taste and aptitude for that description of literary labor; for, although many persons are able to write "leaders," or "literary articles," for a newspaper, few can be entrusted with its editorial control, few can scent out the libel which lurks in almost every communication, few can distinguish the report intended to please the speaker instead of informing the nation, and the letters written to serve private interests instead of public ends; still fewer who can tell at a glance, the kind of literary or political material which will promote the circulation of a journal—in fact, a good editor's great difficulty is not as to what he should put in, but what he should keep out of his columns. Successful editors have not been great authors, but men of good common sense, and their good common sense has taught them to write but little themselves, but to read, judge, select, alter and combine the writings of others.—*Chambers' Journal.*

HOSPITALITY.—I have a higher reverence for the virtues of hospitality than we seem to set upon it at present. When a Turk regales a Christian with ham (as it happened at Athens last winter)—a priest in Lent roasts his turkey for you—when an advocate of the Maine Law gives his German friend a glass of wine—when some of my anti-tobacco friends allow me to smoke a cigar in the back parlor with windows open—there is a sacrifice of self on the altar of common humanity. True hospitality involves a consideration for each other's habits—not our *accus*, mind you, but our usual habits of life—even when they differ on such serious grounds as I have mentioned. But I have dined with vegetarians who said, "Meat is unwholesome, so my conscience will not let me give it to you;" or to the ventilators, who proclaim that "breezes in bed-rooms are injurious,"—and I was starved and frozen.—*Bayard Taylor.*

Speak but little, and to the purpose, and you will pass for somebody.

SABBATH MUSINGS.

REST.

BY CAROLINE A. HOWARD

O, let me rest! From all the striving
After vain-glory and still vain joy!
From toiling o'er, nor arriving
At that bright Future which is Hope's decoy.

O, let me rest! From all the longing
For glimpses of that dreamy world unseen,
Where visions beautiful are thronging
In light which glimmers thro' the mists between!

O, let me rest! From all the grieving
O'er hopes delusive, and o'er wasted hours!
And high resolves, which naught achieving,
But mock the soul's enfeebled powers.

O, let me rest! From all the loving,
Which kindred natures never may requite!
The ceaseless yearning, seeking, roving
After that bliss which maketh burdens light.

O, let me rest! From all the weeping,
The poor relief of countless aching hearts,
Which find no shield, awake or sleeping,
From Disappointment's woe-envenomed darts.

O, let me rest! From all the illness,
All the dying, darkening life with gloom!
O, let me rest in that calm stillness
Which reigns throughout the all-forgetting tomb!

O, let me rest, on Jesus only!
Forgive the murm'ring spirit, sorely tried!
Help me, dear Lord, though poor and lonely,
To find, in Thee, all longings satisfied!
Dedham, Mass., 1859.

"THE LIGHT OF HEAVEN."

We present below a passage from "Meister Karl," in the Knickerbocker. It is a "Refrain" bearing the above title. To our conception it is beautiful:

It is dark when the honest and honorable man sees the result of long years swept away by the grasp of knavish, heartless adversity. It is dark when he feels the clouds of sorrow gather around, and knows that the hopes and happiness of others are fading with his own. But in that hour the memory of past integrity is a true consolation, and insures him, even here on earth, gleams of the light in heaven! It is dark when the dear voice of the sweet child, once so fondly loved, is no more heard around in murmurs. Dark, when the little pattering feet no more sound without the threshold, or ascend, step by step, the stairs. Dark, when some well-known melody recalls the strain once oft attuned by the childish voice now hushed in death! darkness, indeed; but only the gloom that heralds the day-spring of immortality and the infinite light of heaven! It is dark, when, in later life, we tread the scenes of long-vanished pleasures—pleasures pure and innocent, whose memory has often thrilled our soul—whose voices, like those of some phantom band, are ever sweet and sad; but never sadder than when chiming with the after-echo, "We return no more!" Ring as you will, sweet voices, there are loftier joys awaiting in the golden Eden land, which lies beyond the sunset of life, and is gladdened by the light above in heaven! It is dark, very dark, when the grim hand of sickness has passed fearfully over us with its deadly magnetic stroke, and left behind the life-enduring sorrows of blindness, decrepitude or debility. It is dark, sadly dark, when we are neglected for the fair and comely who abound in this gay and thoughtless world. Cheer up, thou poor sufferer; for there are those among angels who love you, and you will yet shine as fair as they, when touched by the light above in heaven! It is dark beneath the noon-day sky—dark in the sun-ray, the moon-beam, the star-light! But for the true heart and trusting soul, who lives in the life of love and gentleness, there beareth ever a light of joy from heaven.

REPENTANCE.—Alas! I can neither set my head nor my heart about anything, but I still show myself to be the sinful offspring of sinful parents, by the sinful parent of a sinful offspring; nay, I do not only betray the inbred venom of my heart, by poisoning my common actions, but even my most religious performances also, with sin. I cannot pray, but I sin; I cannot hear, or preach a sermon, but I sin; I cannot give any alms, or receive the sacrament, but I sin; nay, I cannot so much as confess my sins, but my very confessions are still aggravations of them; my repentance needs to be repented of; my tears want washing; and the very washing of my tears needs still to be washed over again with the blood of my Redeemer. Thus, not only the worst of my sins, but even the best of my duties, speak me a child of Adam. Inasmuch, that whenever I reflect upon my past actions, methinks I cannot but look upon my whole life, from the time of my conception to this present moment, to be but as one continued act of sin.—*Bishop Beveridge.*

PATIENCE OF GOD.—How wonderful it is! Think what he hears and sees, and yet, though immediately holy, so that sin is infinitely offensive to him, and infinitely powerful, so that he can punish it, how he spares! Take the oaths that are uttered. He hears them all, and they soar up in one horrid chorus to the skies. Take the cries which wrong and outrage extort from widows, orphans and the oppressed. He hears them all, and how—as Abel's slaughtered corpse called from the ground—must they pierce his ears and demand vengeance! The blood which is unjustly shed,—drawn from corrupt cities, dwellings and hearts of depraved humanity! And it all mounts to him. And yet he spares—keeps back the struggling thunders. How amazing his patience? He is a God and not a man, and therefore his compassion fails not.—*Rev. J. Bruce.*

EDUCATIONAL

For Moore's Rural New-Yorker.
PUFFING BOOKS.

THANKS to the *RURAL*, that in the various departments of Journalism we can find independence enough to stand firm against the myriads of indiscriminate puff—at least one paper that dare repel the attacks of this literary Briareus of the nineteenth century. Often has the patriot and philosopher told us the need of men; but once cast the eye over our present periodical literature and we shall see the need of men who will and dare stand as sentinels against this ravenous army of quacks in letters who are destroying every independent thought of American writings. Books not dry from the press come to us draped plentifully in the habiliments of bombastic praise, and others yet undeveloped in the "womb of time" are heralded by the press "runners," as the *real nectar of the Gods*; while scarcely does the modest volume start on its mission from the Metropolis, ere its divine afflatus has distilled mildly from the lakes of the North to the coral reefs of the Gulf, and after over the sandy deserts to the puff-gang of California.

But there is one department of puffing to which our thoughts at present are called, viz., School Book. Now, here is a place where no excuse should allow the educator to help a publisher palm off his books, because there is need, oftentimes, that the buyer shall trust the experience of one who professes, at least, to know the need of the purchaser. The teacher surely should be sparing of his meed of praise until thoroughly qualified by investigation in regard to the works recommended. But how is it? Plainly, the same style of political gambling. A new book is crammed down our throats as a word of real genuine examination or practical use has tested its merits. This stuffing is the business of all that great tribe of agents sent broadcast from publishing houses to introduce new works, and we are sorry to say that some teachers embrace this opportunity for money-making. We have in mind, now, a teacher of New York, who changes his opinion in regard to the best works in his particular department oftener than the equinoxes. The great mystery was solved when we learned that said teacher was agent for those books, and would afford them very low for cash—thus making this great sacrifice for the good of students. Thus he would change his opinion as often as the equinox.

But worst of all are our Committee and Official puffs. At Institutes, Teachers' Conventions, &c., the agent slyly works his way into the open hearts of the unsuspecting, scatters liberally his wares of highly instructive works before them, and then, by managing with a few of the leading ones, the books are adopted unanimously by the Committee or Association, who, perhaps, know as little of their real merits as the Bushmen of Africa. Now, we do not blame the teachers so much, yet they ought to be more independent when acting as agents for others; namely, the patrons and youth. Let us have a class of active, independent teachers.

A word relative to the officials—especially of this State, the Commissioners. It is too true, that they are burdened with duties; yet this should be no excuse for hurried glances of books, and then extensive puffs to be heralded by publishers. No, let them say nothing, or what is just, both to the book maker and book-user. Let them not impose upon honest people who trust to their judgment, by the too common practice of dressing up trash in the plenary robes of official garb.

Finally, let us not have careless King Puff, champion of reviews, but honest thoughts of honest men.

Great Valley, N. Y., April, 1899.

A LITTLE LEARNING.

"A little learning is a dangerous thing;
Drink deep or taste not the Pierian spring:
Where shallow draughts intoxicate the brain,
But drinking largely sobers us again."

This sentiment of Pope, so poetically conceived, so gracefully expressed, has been received for generations as a truth which it were madness for any to dispute. It has become a part of our proverbial philosophy. It has insinuated itself everywhere where the English language is known. It has woven itself into our very thought—has assumed a place among our household words—constitutes a part of our educational creed. It meets the tyro at the very outset of his career. It is dimly traced upon the gates of the little round-side chapel, which affords him his first resting place as he begins to clamber upon the famous "Hill of Science." It is pictured upon the doors and lintels of the more pretentious structure, higher up the difficult mount. It is emblazoned on the walls of the gorgeous temple which is supposed to crown its top. And as he goes forth thence, it takes on airy shapes. He seems to hear it in the light whispers of the grove, in the tempest's wail, in the ripple of the brook, in the roar of the sea, in the crowded thoroughfare, in the quiet seclusion of home—"A little learning is a dangerous thing."

Now, what does all this mean? Why—for this is the commonest acceptance—darkness is better than twilight; blindness is to be preferred to an unpleasant dimness of sight; utter ignorance, to mere scraps of knowledge. There is danger in the way down that ushers in the day—in that state, which sees men as trees walking, indicative of coming sight—in those fragmentary fruits of the tree of knowledge which create an ardent desire for more. Tread cautiously ye who are at the mountain's base, for ye walk with uncertain steps on treacherous ground. Tarry not, ye thirsty ones, to drink at the little rills whose waters madden the brain, but hasten onward to slake your thirst with sober draughts at the bubbling pools of the parent fount. "Make haste slowly," is a delusion. "Despise not the day of small things," is a

meaningless injunction, not applicable to the progress of mind. "Take care of the pence and the pounds will take care of themselves," is a foggyism that should have been buried in Poor Richard's grave. "Och! by the powers!" said a newly arrived emigrant upon our shores, "what a murd'rin' fool, to be after picking up a single dollar, when we shall soon be where we can scrape 'em up by the hod-full." A true philosopher that. "Drink deep or taste not the Pierian spring." Now, a truce to this poetic nonsense. I venture the assertion, that truth was never more outrageously outraged in so small a space, as in these same four lines from Pope, as they are generally received in the world. Or, if they are true, as received, then do they constitute the most powerful plea in behalf of ignorance that was ever uttered.

We should, however, think the man insane, or mischievously malicious, who should counsel the starving beggar to reject a crust and insist on the entire loaf, and yet this same insanity manifested in another direction, is received as inspired wisdom. We have nothing to do with the writer's intention in penning these lines, but with the fact, that he is hailed as Sir Oracle in the utterance of a sentiment so utterly repugnant to nature and to truth. Of what other good under the whole heaven does wisdom thus warn us to beware? Yet this is wisdom! Aye!—forgive me this apparent betrayal of my ancestral home—it is wise nonsense. —M. P. C., in N. Y. Teacher.

THE SCHOOL-ROOM A LITTLE WORLD.

The school-room is often called a little world, and a little world it should be in more respects than the term usually implies. There is perhaps a fallacy in the aphorism of Tupper, "A kingdom is a nest of families, and a family, a small kingdom;" but in regard to the school, we say, let it be a microcosm.

There are little boys, fellow-classes, who will soon be fellow-citizens. Let them learn in their juvenile intercourse those courtesies and principles of action, that will be requisite when they become men. Dr. Carpenter says in his *Physiology*, that the brain grows to the condition under which it is habitually exercised. If this be true, and I suppose no one will question it, it is a matter of some moment to consider the best mode of exercising the six thousand tons of brain now plastic in the school-houses of our country. Makers of surveying instruments are very careful to graduate the arcs, which will indicate the direction of the telescope, with the utmost accuracy, as the minutest error will be vastly magnified in the position of the distant object. So in the school-room, the microcosm, which is concentric with the macrocosm, or the world's wide stage, the smallest error in direction will lead to a departure which no traverse table can indicate.

If it be true that knowledge is composed of ideas, "which are the joint product of the mind on the one part, and of external causes on the other,"—it is manifest that the opportunities of observing the objective, are of great importance in an educational course. Hence such an apartment as Dickens described, where nature was strongly bricked out, as killing airs and gases were bricked in, should never be selected for a school-room. On the other hand, as much of nature as is possible should be introduced, and so arranged as to arrest the pupil's attention whenever his eye may wander from his book. It is objected that the book will receive but little attention! I would say, be it so, so long as no interest is felt to learn its contents. But in getting knowledge, as in getting money, the more we have, the more we want; and from observation and oral instruction alone, a thirst for knowledge is often acquired which libraries cannot supply.

Let Aquaria exhibit the living wonders of the deep; let Geological cabinets present the wondrous forms and huge proportions of former animals and plants; let collections of minerals display the glittering ores and symmetrical crystals of the rugged mountains; strew flowers from the wild woods and cultivated garden, in the way of the youthful hero—for such should every school-boy determine to be—and make the school, as in ancient times, a pleasant place of resort. But men, not boys, attended those ancient schools or places of recreation and leisure from the active duties of life. Boys are better than men, and will make better use of the privileges afforded them. Such at least, is the experience of one who has been a teacher for twenty years.—Curiosity is the antecedent of attention, which is indispensable to every learner. Let curiosity be properly directed, and, as far as possible, gratified. Cultivate the perceptive faculties by constantly exercising them—bring to aid the organs of sense, the telescope and microscope, models of engines, pumps, and various machinery, as well as drawings and diagrams. See in every tiny object, the manifestations of the same law which made the earth a globe; in the school-boy's sling, the principle that changed the globe to a spheroid; in every rolling hoop or spinning top, the cause of the procession of the equinoxes, and departure of the polar star so far from its place, that in 13,000 years it will even set in the north-west and rise in the north-east—and make the school as far as possible a little world, where, as is the case with the symmetry of large ships, the model will afford the best opportunity for study and investigation.—N. B. WEBSTER, in *Educational News*.

A SMART SPELL.—A gentleman in North Chester, Vermont, two or three weeks since offered as a prize a copy of Webster's Unabridged Dictionary to the one of the scholars in all the public schools in town who should "spell all the others down."—Seven schools were accordingly represented, and about a dozen teachers and a large crowd of spectators were present, when the trial took place on the 25th ult. But one trial was to be had on a word, and the unfortunate who missed must take his or her seat. Eighty scholars contested for the honor and the prize, and after five hours' trial, five pupils remained standing, and the enthusiastic audience soon raised the needful to purchase each a copy of the great Unabridged.

Foots like the hedges which bound the road of life—what can the wise man do but smile as he passes along it?

It is well known that the harbor of Vera Cruz, if indeed it may be called a harbor, affords but slight protection to vessels at anchor, when the terrible tornado called the *Norte*, or *Norther*, sweeps the Gulf of Mexico. R. A. WILSON, in his *History of the Conquest of Mexico*, of which we shall speak in a subsequent number, thus describes a tempest which he witnessed:

"The port was filled with shipping, when a well-known monitor, the sinking of the atmosphere upon the mountain northward, foretold the impending danger. A crowd gathered upon the shore, from that attraction of mutual sympathy so keenly felt towards men in imminent peril. All looked intently at the heavens, as they gathered black, and saw far off on the horizon the clouds and waves mingled together in one great vaporous mass.—Now and then were brief intervals of bright skies; again to be quickly overcast, and shrouded by a more intense darkness, while the temperature fell to a degree of chilliness unusual in the 'hot country.' The howling of the wind was terrific. The crowd was near enough to see, or at least to catch a glimpse of the shipping. Every extra

The Reviewer.

THE METHODIST; or Incidents and Characters of Life in the Baltimore Conference. By MIRIAM FLETCHER. With an Introduction by W. P. STRICKLAND, D. D. In two volumes. New York: Derby & Jackson. [12 mo. pp. 864 and 860.]

ALTHOUGH this work belongs to the class denominated imaginative literature, it not only bears internal evidence of truthfulness, but some of the actors in the scenes described now live, enjoying, in peaceful old age, the fruits of laborious and well-spent lives. It is designed to rescue from oblivion the trials, toils, and labors of the early Methodists in the Baltimore Conference, and cannot fail to interest and, we think, improve the hearts of those who read its pages. The descriptions of scenes at Camp Meetings, Quarterly Meetings, Love Feasts, as well as the travels and privations of the circuit preachers in the thinly-settled districts, are always interesting, often sublime. From the Publishers.

ORIENTAL AND WESTERN SIBERIA: A Narrative of Seven Years' Exploration and Adventure in Siberia, Mongolia, the Higher Steppes, Chinese Turkestan, and part of Central Asia. By THOMAS W. ATKINSON. Philadelphia: J. W. Bradley. [12mo., pp. 489.]

This is a compilation. The author was an English artist, and traveled to gratify his taste for romantic scenery, and taking of views never seen and scarcely known to Europeans. He traversed much of the unexplored regions of Central Asia, making 500 sketches in colors, which are given in the large work published in London, of which this is an abridgement. The engravings, printing, paper, &c., of the volume before us are not first class, though good for a cheap, popular edition. For sale by ALLING & COY.

Books Received.

LECTURES ON METAPHYSICS AND LOGIC. By Sir WM. HAMILTON, Bart., Professor of Logic and Metaphysics in the University of Edinburgh; Advocate, &c. M. (Oxon.) etc.; Corresponding Member of the Institute of France; Honorary Member of the American Academy of Arts and Sciences, and of the Latin Society of Götting. Edited by the Rev. HENRY L. MANDEL, B. D., Oxford, and JOHN VINTAGE, M. A., Edinburgh. In two volumes. Vol. I.—Metaphysics. [8vo.—pp. 718.] Boston: Gould & Lincoln. Sold in Rochester by ADAMS & DABNEY.

MOTHERS AND INFANTS.—Nurses and Nursing. Translation from the French of a Treatise on Nursing, Weaning, and the General Treatment of Young Children. By Dr. AL. DORNE, late head of the Faculty of Paris, Inspector General of the Schools of Medicine, etc. Boston: Phillips, Sampson & Co. [12mo. pp. 308.] Sold by DEWEY.

FRANKWATER, or The San Jacinto in the Seas of India, China and Japan. By Wm. Maxwell Wood, M. D., U. S. N., late Surgeon of the Fleet to the U. S. East India Squadron; author of "Wandering Sketches in South America, Polynesia," etc. New York: Harper & Bros. [12mo., pp. 545.] For sale by DEWEY.

THE LIFE OF NORTH AMERICAN INSECTS. By B. JAGGER, late Professor of Zoology and Botany in the College of New Jersey. With numerous Illustrations from Specimens in the Cabinet of the Author. New York: Harper & Bros. [16mo., pp. 819.] Sold by DEWEY.

FRANK ELLIOTT; or, Wells in the Desert. By JAMES CHALLINOR, author of "The Care of Marching," "Christian Moralities," etc. Philadelphia: Jas. Challinor & Son. [16mo., pp. 347.] Sold by DABNEY & BRO.

FIRST THINGS: or the Development of Church Life. By BARNY STOW, author of "Christian Brotherhood," etc. Boston: Gould & Lincoln. [16mo., pp. 282.] Sold by ADAMS & DABNEY.

SHAKESPEARE'S LEGAL ACQUIREMENTS CONSIDERED. By JOHN LOUD CAMPBELL, LL. D., F. R. S. E., in a Letter to J. PATER COLLIERS, Esq., F. S. A. New York: Appleton & Co. Sold by DEWEY.

"LOVE ME LITTLE, LOVE ME LONG." By CHAS. READ, author of "It is never too late to Mend," "White Lies," etc. New York: Harper & Bros. [16mo., pp. 438.] For sale by DEWEY.

THE HOME MUSICIAN. A Collection of Songs and Ballads, for the Voice only. Boston: Oliver Dison & Co. For sale by WM. S. Mackie.

VERA CRUZ IN A STORM.

anchor that could be got at was soon thrown out. But to little purpose: a coral bottom is but poor holding ground in a Norther; and one by one the fleet began to drag; even the castle, *San Juan de Ulua*, itself, seemed at times as though it would be torn from its rocky foundations and dashed upon the town. The terror of those on land was hardly to be described, as they saw the apparent destruction of both vessels and crews so nigh. Now and then one would hold a little by some new obstacle the anchor caught, but the resistance giving way, it soon moved again, approaching the shore, to which all tended, excepting those sheltered under the lee of the castle and island. They did not all drag at once, or together, but one by one, as their powers of endurance gave out; and one by one they drove towards the beach with little of help, or hope, if the storm continued. Even that little gave place to despair, as vessel after vessel approached the land; and, as they were dashed upon it, men held their breath, watching the hardy seamen struggling in the waves. One staunch vessel without cargo being carried broadside on, her crew leaped out of her and ran off safely."

LONDON BANKS.

THERE are nine joint-stock banks in London, with a combined capital of nearly four millions sterling; and current deposits nearly forty millions sterling; and circulation—none. Their payments in bank-notes are made in the notes of the Bank of England. The immense increase in the banking business of London alone is shown by the annexed aggregates of deposits in the nine banks first named above, between 1848 and 1858:

Year 1848.....	£ 9,828,000 or \$ 49,115,000
" 1853.....	20,812,000 " 104,000,000
" 1858.....	89,583,000 " 197,015,000

The balances at the Clearing House are paid by checks for the precise amount on the Bank of England. This obviates entirely the tedious and vexatious payments of coin as still pursued at the Clearing House in Wall street.

The absence of small bills in London and the interior—the Bank of England issuing none under five pounds—gives a steadiness to the bank-note currency which is well worth consideration. The larger bills enter into the operations of commerce, but the petty transactions of the day, anything under five pounds—or twenty-five dollars—are adjusted by the medium of gold and silver. Thus the lower classes of people, market people, tradesmen, etc., are not annoyed with small bills, which here uniformly are the beginning of a crisis.

We submit these tabular statements for those who have the currency question under consideration, suggesting that the bank-note system of England may be well worth adopting here.—N. F. *Courier and Enquirer*.

DIVIDING ONE'S TIME.—Some plodding genius has discovered, while spending his own time, that the word *TIME* itself, when artificially transposed, or metagrammatically, will form the following words, meti, emit, item. And if the afore-named and its anagram be placed in the following quadric position, they will form what may be termed an anagrammatic palindromic.

T I M E
I T E M
M E T I
E M I T

This word *TIME* is the only word in the English language which can be thus arranged; and the different transpositions thereof are all, at the same time, Latin words. These words in English, as well as in Latin, may be read either upwards or downwards. The English words, time, item, meti, and emit (to send forth), are mentioned above; and of the Latin ones—Time, signifies fear thou; Item, likewise; Meti, to be measured; Emit, he buys.

ANIMAL AND VEGETABLE LIFE.—There is nothing short of revelation that more beautifully or satisfactorily proves the existence of an Almighty mind, than the fewness and simplicity of the ultimate elements of animal and vegetable life. Thus, there are but four elementary principles essentially necessary, and but six generally employed, to form every variety of organic life; nitrogen, carbon, oxygen, and hydrogen are the bases, to which sulphur and phosphorus may be considered supplementary. With these, infinitely varied in their atomic proportions, are built up not only the whole animal kingdom, but also every variety of the vegetable world—from wheat, the "staff of life," to the poison of the deadly *Upari* tree. It is also worthy of remark, that these four elemental principles are those also of which both air and water are composed, so that air and water may be considered in truth and fact, as being the original elements of organic life.—Dr. Zoulman.

YOUNG RURALIST.

PLEASURE GARDENING FOR CHILDREN.

Messrs. Editors:—I am an old man, and therefore, perhaps, I have no right to occupy even a line in the column devoted to *YOUNG RURALISTS*, unless as some may think I have arrived at second childhood, and can make my claim on this ground. This point, Mr. Editor, I will leave for your decision.—But, I am an old gardener; my father learned me to love gardening, and my mother taught me the names of the flowers, and to love them too—and that was long, long ago. I have no little boys now that I can tell about gardening, and so I thought I would teach the great *Rural Family*, for I understand the matter right, Mr. *RURAL*, you have a very large family of young folks, numbering several thousands.

As everything should have a head—I hope all the boys and girls who read this will get their full of wisdom—I have placed *Pleasure Gardening for Children* as the head of this article. Now, all gardening to me is *pleasure gardening*. I receive as much pleasure, I think, from raising a fine patch of corn, or splendid melons, as I do in growing a shrub, or tree, or flower. The pleasure of gardening is mainly in doing everything just as well as it can be done—a little better, if possible, than it was ever done before. I would at any time rather see a finely grown *Beet* or *Cauliflower*, than a poor, half-starved, neglected *Rose*. One looks like a gentleman in rags, pride and poverty united—the other like a well fed, honest laborer, of the first class, who is all he claims to be, with no desire to pass for what he is not. If boys will learn this, and feel so too, they will never make poor farmers, nor brainless dandies—nor will they ever value fine appearances above true worth.

But, I am not getting at my subject, for old men, like children, are fond of talking, and I must commence. I take it for granted that all the children who read the *RURAL*, can have a small piece of ground for their own gardens if they will take care of it. It is to-day the 20th of April, and if this is printed my young readers will probably get it before the 1st of May. At any rate, as soon as you get this number have your garden nicely dug up, deep, and raked smooth. Your little gardens are not large enough to grow peas and early potatoes, and those kinds of things, and they will be provided plentifully in the gardens of your parents, we hope, for we pity the poor children who have not a good supply of good peas, and corn, and radishes, and Lima beans, and melons, during the summer. There are a good many such poor children, although some of their parents are very rich. The larger children, however, if they can get ground enough, may grow plenty of such kind of things. The *Horticultural Department* will tell you how it is done, so I need not fill up this column with directions. After the little patch is dug up and raked, then get a piece of narrow board with a straight edge, for a ruler, lay it upon the ground and make your name in printing letters, or the first letters of your name, by forming shallow drills from one to two inches wide. In these drills sow lettuce seed and cover them nicely, and in two or three weeks after you will see your name in living green letters. Then make your little brother's or sister's name in the same way, and sow the seed of *curled cress*, or pepper grass, which is the same, and in one week, if the weather is fine and warm, this pepper grass will be up, and afford the little one a good deal of pleasure. In a week or ten days after, the *cress* may be cut, and is excellent with bread and butter for tea, or cut up with vinegar.

I designed to tell the boys how to raise a few melons and radishes nice, but I have talked so much that I must leave it until next week.

OLD GARDENER.

DON'T THINK.

WALKING in the country one morning, in early spring-time, we seated ourselves to rest on a large stone near an orchard gate. Very soon we observed a large man hanging to the topmost limbs of a small apple tree by one hand, while with the other he was cutting off twigs and branches. We bade him good morning. He answered cheerfully, and we ventured to hint that the tree he had climbed bore a heavy burden. "Yes," he said, "the trees all need pruning, but I can only attend to a few of them. The others would not bear my weight."

"Why don't you fasten your saw to a pole, stand upon the ground, and prune such trees as most require it?" we asked.

"Well, I declare," he answered, "that would do—I didn't think of it."

There was a valuable lesson in that confession, "I didn't think of it." It explained why, in many respects, the farmer was not so prosperous. He was a hard worker. He endeavored to be economical, but he was always behind. His cattle had disease; his grain was often poor, and he could only sell at a low price—because he didn't think. He had never learned forethought; he did not know what it was to consider; he did not understand how judicious head-work assists hand-work.

"Didn't think!"—that is the sorry explanation of much error, of many a crime, of many a failure, of many a hardship, and many an abuse.

Little boys and girls, bear in mind that whatever advantage you may have at home, in school, in business or society, unless you think, your lives will be sad and your efforts unsuccessful. Learn, then, while you are young, the art of thinking. To be great and good you must understand the art of reflection, as well as appreciate the pleasure of memory.—Selected.

TO REMOVE GREASE FROM BOOKS.—Lay upon the spot a little magnesia or powdered chalk, and under it the same; set on it a warm flat-iron, and as soon as the grease is melted it will be all absorbed and leave the paper clean.

For notice to Correspondents and Readers see first column of next page.

Review of the Week.

The arrival of the Arabia, at Halifax, with a week's later news (a synopsis of which will be found in another column,) seems to confirm the warlike spirit observable in the dispatches of the previous steamer. Austria and France are equally active in all preparations for offense and defense. Statisticians are already figuring the chances of the combatants, and we present the following view which seems to be the most tangible of any brought to our notice. Austria has \$20,000 in her Italian possessions, being a force equal to about one twenty-third part of all her Italian subjects. A country that can be retained only by such a force as that, is not worth having. The army is large; but in case of war, at least 50,000 of it would have to be left in garrison, and an equally great number so stationed as to be ready to act in other Italian communities, or against the Lombard peasantry. Hence, she could bring but 150,000 men against the French and Sardinians, and the latter could bring 40,000 men into the field, while France ought to be able to send double that number by land alone. The real weakness of Austria, however, would proceed from the naval superiority of the French by sea, as the latter would be able to choose their points of attack, and so compel the Austrians to disseminate their forces, and so dissemination is often fatal to armies. To equalize her forces with those of France and Sardinia, Austria should have 200,000 men in Italy, and heavy forces in all the countries bordering on the Adriatic and its estuaries. As to help from any of the Italian rulers whom she helps, it is what she cannot look for, and probably does not expect. They would have enough to do to uphold their own power, if that could be upheld. She is clearly overmatched.

From Washington we learn that Secretary Cass has expressed to the Nicaraguan Minister his approval of the Cass-Yazani Treaty, but the President rejects it. His objection has been stated as known as the additional article, as amended by Nicaragua, which provides that the United States will do all in her power to enforce the neutrality laws, and for the prevention of any armed expedition against Nicaragua. While some prominent gentlemen look upon this as a reflection of our good faith in carrying out the neutrality laws, and as unnecessary, others are disposed to regard the ratification as an evidence of a disposition of Nicaragua to cultivate friendly relations with the United States. Slight as the amendment is, it is not certain it will be acceptable to the Administration, which has not yet given it due consideration with regard to the efforts of the British authorities to remove the obstacles

to the Clayton Bulwer Treaty. Much interest is manifested in diplomatic quarters in regard to the subject. It is stated that Gen. JOHNSON will return to Nicaragua in the steamer of May 5th.

The Sickles trial drags its slow length along. It was hoped that counsel would submit the case to the jury without argument, and a conclusion would thus have been obtained on Saturday, the 25d inst. But speak they must and will—when exhaustion occurs we shall look for a verdict.

Our State Legislature found a day of adjournment at last. The dissolution occurred on the 19th inst. The Legislature sat one hundred and six days. During that time 895 bills were introduced in the Assembly, and 852 in the Senate, making a total of 1,747. The total number of bills passed by both Houses is 536, much less than one-half of those introduced. The Governor, on the 18th, had signed 512, vetoed 13, just a baker's dozen, and had under consideration 11. While the "use of duty and social intercourse" which bound our lawmakers together were being severed, wit, humor, solemnity and deep feeling ruled the hour, as each individual was impressed by the transactions around him. We may "raise the curtain" upon some of the "closing scenes," in a future RURAL.

In another portion of our present issue it will be observed that Gen. TWISS has ordered out a considerable force for the purpose of chastising the Indians of Texas. This would seem to be necessary, if the following paragraph (said to be well authenticated,) contains nothing but the truth:

"Capt. Foss, with forty-seven of his men, left camp in pursuit of the Indians, who had carried off four hundred horses. He was joined by two hundred friendly Indians, and afterwards by Major VAN DONN, with two hundred and eighty regulars. After the united forces had passed the headwaters of Red river, Major VAN DONN, not deeming it prudent to press the pursuit further without additional supplies for men and horses, turned back. Capt. Foss and men, with the friendly Indians, continued two days traveling in the direction of Kansas. Between midnight and daybreak of the second night, the Indians left the camp of Capt. F. About daylight Capt. F. found himself surrounded by eight hundred warriors, who demanded his surrender. He refused, and ordered his men to prepare for fight, each being armed with two revolvers and a rifle. They fought bravely and desperately, but were overpowered by numbers, and all butchered except Capt. Foss and four of his men, who cut their way through and escaped."

DURING the night of Friday, the 22d inst., we were visited by a north-easter with the unusual accompaniments. For about twenty-four hours the warring elements had everything pretty much their own way—wind, rain and snow alternating. Sunday morning we were blessed with nearly six inches of snow. The storm extended to Syracuse on the East, and to St. Catharines, C. W., on the West—the fall of snow growing heavier as its western boundary was approached. In Buffalo the people rode to church in sleighs. We are not possessed of the figures, but are inclined to the belief that more moisture was deposited during this brief storm than for any similar period within a twelve-month.

The Overland Mail, with San Francisco dates to the 25th ult., arrived at St. Louis on the 20th inst. The news is unimportant. Markets generally unchanged. The State Finances were flourishing—upwards of \$80,000 in the Treasury. The mining news from California and British Columbia, was favorable. The news of the admission of Oregon as a State reached Portland on the 16th ult., but occasioned no demonstration. Passengers by the mail report the massacre of a family of nine persons by the Caddo Indians, in the vicinity of Cooper Camp, Texas.

EXPORTS OF BREADSTUFFS.—The Courier and Enquirer says the exports of breadstuffs from New York to Great Britain and Ireland, for the fiscal year commencing the 1st of September last, is about one-ninth that of the three previous years, and the aggregate exports of the same from the United States for five fiscal years, have been as follows:

Year.	Value.	Year.	Value.
1853-4.....	\$48,383,000	1855-6.....	\$54,019,000
1854-5.....	81,257,000	1856-7.....	58,024,000
1857-8.....		1858-9.....	\$53,098,000

An average of forty-three millions of dollars; or ten millions in excess of the last fiscal year; and ten millions less than the export in 1846-7—the latter having been \$53,262,000.

THE RUMORED CUBAN REVOLUTION.—The official Gazette of Havana, in its issue of April 10th, publishes an elaborate article contradicting and ridiculing the report that an expedition of filibusters from the United States has started, or is about to start, for the island of Cuba. It says that the people of the island are contented, prosperous, and devotedly loyal, and have for their defence an army of 30,000 regulars and 30,000 armed volunteers, and a fleet of more than thirty vessels; that it is absurd to suppose that the filibusters, if they succeeded in effecting a landing, could accomplish anything but their own destruction.

A NEW CONTROVERSY.—A new controversy with Great Britain is growing up in the North West. It appears that when the United States gave up the right to all the territory as far as 54° 40' north latitude, the boundary was laid down in such an ignorant and careless manner, that it is now uncertain whether certain waters and islands belong to Great Britain or Washington Territory. The influx of settlers has rendered these doubtful islands valuable, and the chances for another dispute seem to be excellent.

N. Y. STATE EDITORIAL AND TYPOGRAPHICAL ASSOCIATION.—The Sixth Annual Meeting of the New York State Editorial and Typographical Association will be held in the city of Syracuse, on Thursday, June 9, 1859, at 12 o'clock M. It is expected that the Annual Address will be delivered in the evening by Hon. HORACE GRACEY, editor of the N. Y. Tribune. After the address, a poem will be delivered by ARNOLD G. CHAMBERLAIN, Esq., editor of the Syracuse Daily Journal.

Personal and Political.

Gov. RANKIN has appointed Hon. Luther S. Dixon, of the Ninth Circuit, as Chief Justice of the Supreme Court of Wisconsin, in the place of Judge Whitton, deceased.

Iowa holds a Republican State Convention at Des Moines on the 2d of June.

Dr. Wm. SAWYER, who was the oldest living graduate of Harvard University, having graduated in 1789, and an eminent physician, died in Boston Monday week, aged 89 years. Hon. Josiah Quincy is now the oldest living graduate of Harvard.

Tas Hon. Geo. M. Bibb died of pneumonia, at his residence, in Georgetown, on the 21st inst. He was a long time United States Senator from the State of Kentucky, and Chancellor of that State, and subsequently filled the office of Secretary of the Treasury in the administration of President Tyler. His age was between eighty and ninety years.

Tas Jackson (Mrs.) Eagle of the South, argues that, inasmuch as by the Federal basis of representation, slaves are counted only at three-fifths, and as African apprentices, "bound to service for a term of years," would be computed and fully represented, thereby increasing the power of the South in Congress, that the establishment of such a system is worthy of the serious consideration of the South.

Tas Hon. Jeremiah Clemens, of Memphis, Tenn., in a speech at Nashville, Tenn., on the 29th ult., said that it required extraordinary credulity to believe that the Administration intended to use the \$30,000,000 it asked for of the late Congress in the purchase of Cuba. "In my honest opinion," continued Mr. Clemens, "the intention was to use it as a corruption fund, to secure the nomination and election of Mr. Shidell as President of these United States. There is nothing in the past history of either James Buchanan or John Slidell to place them above suspicion. Give them \$20,000,000 to be used in buying Spanish officials, and unless some such miracle occurs as that of the leopard changing his spots, a part of the sum will be employed in buying the Charleston Convention, and the remainder in purchasing the vote necessary to insure the election of its nominee." These "Honorable" ought to know how the wires are pulled.

Hon. WILLIAM C. BOCK, of Schobarie, died at his residence in that county, on the morning of the 19th instant, aged seventy-three years. From a notice of Gov. B. in the Albany Argus, we learn that in 1807 he held the first offices of the town of his residence in Schobarie, and in 1812 was appointed Sheriff of the county. He was a member of the Assembly in 1814-15-16 and '18. In 1820 and '21 he was a State Senator. In March, 1821, he was elected by the Legislature one of the Canal Commissioners. This office he held uninterruptedly until 1840. In 1840 he was the Democratic candidate for Governor, but was beaten by Gov. SEWARD. In 1842 he was elected Governor, and held the office for one term, retiring from it on the first day of January, 1845. In 1846 he was a member of the Constitutional Convention. In the same year he was appointed by President POLK Sub-Treasurer in the city of New York, and held that position until the accession of President TAYLOR, in 1849. From that time he has quietly resided at his homestead in Schobarie, agreeably spending the evening of his days in the home, and among the associates of his youth and early manhood. He lived on the same farm occupied by his father and grand-father, and which was a part of the tract on the Schobarie creek patented by the latter and others from George the II, in 1755.

Important News from Utah.

The Deseret Valley Tan of the 15th of March, contains the following news of interest:

Between four and five thousand persons will leave this Territory for the States and California, all of them apostates from the Mormon Church, in a few months.

A rumor of a collision between troops stationed at Provo and Mormon citizens, prevailed at Salt Lake City. The troops were stationed there by order of Judge Cradellbaugh during the session of his Court. It was supposed that the Court would adjourn the 15th, and that nothing would be done except to try two Indians, the Church hierarchy that controls this people over-reaching the jurisdiction of the United States Courts. Judge Cradellbaugh thus explains this matter in his charge to the Grand Jury:

"Some United States troops are here. Perhaps it is an unusual thing. I knew that there were those who were guilty, out of the camp, and also that there were many guilty around here of numerous offences. I was informed that there was no prison here, and those troops were sent by the commanding General, at my request, to take care of the prisoners now in custody, and not to interfere with any one. They are here to take care of and preserve the peace. If prisoners are brought they will be taken care of, and the whole authority of the troops is to detain those persons in custody until they are called for by the Court, and they have no power beyond that Court." The Judge, in his charge to the Grand Jury, refers to the fact that attempts had been made to destroy the Court and its usefulness, and even to bring the jurors into dispute. He refers to many cases of murder and crime committed throughout the district, but in which no indictments had been found by previous Mormon Grand Juries.

S. L. HUBBELL gives an account of his travels from Salt Lake City to Weber Station. At Emigration Canon, he met snow 12 to 15 inches deep. Over the Little Mountain the snow was four feet deep; at the spring on the Big Mountain, the mail party, having traveled eleven hours, had made two miles. Mr. Hubbell started next morning, and found the snow six to eight feet deep. Still further on, in eight hours' travel, they made half a mile. But the worst was to encounter in getting down the Big Mountain, where the snow was at least 15 or 20 feet deep. Monday, the 21st of February, they made East Canon Creek, all nearly snow-blind, except one Mexican and the writer—four of them could only keep the path by holding on to a mule—in snow six to ten feet, and not a sign of a trail. On the 22d, they arrived at Weber Station, and were relieved.

News Paragraphs.

Capt. JOE PARKS, the celebrated Shawnee Chief, died at Westport, Mo., on the 4th inst. He had been for twenty years the ruling spirit among the Shawnees on the Missouri border, and his loss will be severely felt by his tribe.

At a recent festival in Paris, Louis Napoleon wore a sword whose scabbard and hilt were covered with \$30,000 worth of diamonds, while the Empress displayed a million of dollars worth of diamonds.

In pursuance of orders from the War Department, the recruiting service throughout the United States was discontinued on the 30th ult. The ranks of the army are now full for the first time in twenty years, but there is a considerable surplus of recruits from which to fill future vacancies. We are now ready for the next war.

Vermont is reported to be in a state of revolution. An action had taken place between Generals Garraux and Plinto, in which the former was routed. The town of San Felipe had been plundered of \$100,000 worth of property by Gen. Zamara.

The Davenport Gazette has a letter from Florence, Nebraska, dated the 5th inst., stating that there was then eighteen inches of snow on the ground, and it had drifted terribly. A dreadful storm of wind had prevailed, prostrating almost everything in its way. No covered wagon or tent could stand before it. It is to be feared that there has been a great loss of life on the plains among the emigrants to Pike's Peak and elsewhere, and certainly a great deal of suffering, at the least.

The average income of the Mexican Church is twenty-five millions a year, while the revenue of the National Government of the Republic is only fifteen millions.

Lord CAMPBELL's bill substituting the verdict of the majority for the unanimous verdict of juries in civil cases, has been thrown out of the House of Lords. Only 7 votes were given for the measure.

The number of Jews in Oregon, most of whom are engaged in commercial pursuits, is large. In Portland they have a synagogue, lately incorporated by the Legislature, under the name of the "Congregation Beth-Israel," where religious worship is conducted after the custom of the German Israelites. A large portion of them, however, are free-thinkers.

The opposition to the presence of the Chinese in California is growing stronger every day. In the mining districts the hostility is kept within bounds only by the strong arm of the law. Among the bills before the Assembly is one to put a stop to the species of serfdom by which large numbers of Chinese are held by wealthy Chinese companies in a condition of slavery. Also a bill increasing the tax upon Chinese laborers, and others annoying them in different ways.

WEDNESDAY week will be remembered by the clerks in the N. Y. Post-Office. The foreign letters dispatched were 35,187; the foreign letters received per Niagara, Kangaroo, and Persia were 73,493; add to those 99,000 for domestic—sent and received—and we have a total of nearly 200,000 letters, making the largest and heaviest day's work ever known in the Post-Office.

COL. WILLIAM BENT, of Bent's Fort, which is in the midst of the Kansas gold region, has arrived in Illinois, and gives it as his opinion that money cannot be made at Pike's Peak unless richer mines are discovered than have yet been found. His opinion is worth something.

The remains of the Christian hero, Havelock, lie in a dirty kitchen garden at Lucknow, India, the only mark to designate the spot being his name rudely cut in the bark of a neighboring tree.

The Hamilton (C. W.) Times mentions the following peculiarities of the new Canadian cent coin. They are not only tokens of value, but also standards of weight and measure. One hundred cents weigh exactly one pound, and one cent measures one inch.

For the first time in 51 years, the Chief Justice of Canada was presented by the Sheriff with a pair of white gloves, signifying, according to the old English custom, that there were no prisoners to be brought before the present Assizes.

The Government lands of Michigan, which were withdrawn from market two or three years ago, for the purpose of permitting the railroad companies make their selections from the grant of Congress, have been restored, and the land-offices at Ionia and other places again thrown open to purchasers.

It has been found in Springfield, that 290 gallons of Massachusetts State rum does not contain pure spirits enough to pay for distillation. Massachusetts had better stop peddling liquor.

The Court Milliner recently died in London, leaving property valued at \$400,000. She leaves most of it to charities; for herself, she directed that she should be buried in point lace.

The Milwaukee News says a large number of Pike's Peak explorers from Wisconsin are returning. They have little to say, and nothing to show.

NINE and a HALF MILLIONS of acres of the public lands in Kansas and Nebraska which were withheld last year on account of the financial revolution, will be in market in July, August and September. It is expected that these sales will increase the revenue for the next fiscal year very materially.

The Utah correspondent of the Chicago Tribune has taken notes of the status of that territory. The results foot up as follows:—Three hundred and eighty-seven men with seven or more wives; of these 13 have more than 10 wives; 780 men with five wives; 1,100 men with four, and 1,400 with more than one wife.

Since the commencement of the Sickles trial an average of 15,000 words have been sent by telegraph daily from Washington to New York. Such an amount of telegraphic transmission never was heard of in Europe, and is unprecedented in this country.

There is an abundance of splendid timber of the softer kinds in California, but the country is destitute of the tough, hard timber for ship building and other purposes requiring stout and durable material. The whole supply of such timber is obtained from the Atlantic States—of course at great cost. All the wood for land carriages is imported, as are also axes, hammer and hoe handles.

The News Condenser.

—The number of guns carried by the British navy is 15,138.

—Washington Irving attained his 76th year on the 3d inst.

—Philadelphia has nine steam fire engines ready for service.

—It is again reported that Spurgeon is coming to this country.

—It is now stated that the Sickles trial will last till the first of May.

—At noon on Monday week the Governor of this State had signed 270 bills.

—Seven million gallons of whisky are annually consumed in Scotland.

—There are about twenty-nine thousand post-offices in the United States.

—Miss Harriet K. Hunt, of Boston, has commenced to preach the gospel.

—There were 4,469 bales of cotton burnt at the late fire in New Orleans.

—Rev. Mr. Finney is preaching daily to crowded audiences in London.

—Stone coal has been discovered in the town of Boston, Erie Co., N. Y.

—There is said to be an active volcano in a secluded part of Shasta Co., Cal.

—Strawberries, of Maryland growth, have appeared in the Baltimore market.

—The population of Paraguay in 1855 was 976,000; two thirds of whom are Indians.

—A young man died in N. Y. city recently from inhaling chloroform to allay the toothache.

—An English paper says the Prince of Wales will be Viceroy of Ireland before the close of 1860.

—There is much excitement in Norwich, Conn., in consequence of the small pox breaking out.

—The French experiments in fish culture have discovered that salmon may be raised in fresh water.

—The railroads in the six New England States have cost more than a hundred and fifty million dollars.

—A writer in one of the N. Y. city papers proposes the establishment of an asylum for indigent old men.

—The Massachusetts Legislature is to hold an extra session to revise the constitution of the Reformed States.

—Attorney General Black feels much better than he did some time ago, and has gone back to Washington.

—A law recently passed in Maine establishes the annual salary of the members of the Legislature at \$150.

—Some ninety liberated slaves, and over thirty free negroes, are about to embark, at Baltimore, for Liberia.

—The Southern route for a Pacific Railroad has been abandoned. No water to be had by boring six hundred feet.

—Two girls passed through Providence, Ill., a few days since, on their way to Pike's Peak with an ox team.

—Dr. Duff, the eminent Scotch missionary in India, who visited America a few years ago, is again in feeble health.

—An extensive iron mine, of exceeding richness, has been discovered in Oregon, about thirteen miles from Portland.

—Five men accidentally happened to congregate at a store in Monterey, Cal., whose combined weight was 7,076 lbs.

—Wm. Wilson, formerly a member of Congress from the Leocoming District, Pennsylvania, died at Snabury last week.

—During last winter, the State of New York supported, in various ways, 30,000 persons as paupers or prisoners.

—The State of Ohio has wormed an auger into itself at Columbus to the depth of 1,960 feet—not a drop of water yet.

—It is stated that buildings to the value of over three million dollars are now in the course of construction in New York.

—Fresh bananas and Bermuda potatoes are selling at Albany—the former 10¢25 cents each, and the latter \$1.75 per peck.

—The quantity of oysters opened at Fairhaven, Conn., within the past six months, is 700,000 bushels, equivalent to 250,000 gallons.

—A letter from a planter in Florida, says that it has been raining almost incessantly in that region for the last three months.

—The news of the admission of Oregon as a State reached Portland on the 15th ult., but occasioned no demonstration.

—A man in Indiana has been sentenced to eighteen years' imprisonment, for burning his own child to death because it fretted.

—The Green Bay Advocate says that none of the saw mills in that city are running, and but three of them will fire up this summer.

—The Lawrence Herald of Freedom states that the prospects for the establishment of a University in Kansas are very flattering.

—The Massachusetts Legislature has before it a bill making a single case of drunkenness a crime to be punished with imprisonment.

—Dr. Scanlon, of Wurtzburg, who attended the Empress of Russia at the birth of her last child, has received for his services \$25,000.

—A vessel arrived at Portland from Havana, when 24 hours of port, picked up a cat, which was demurely seated on a bale of goods.

—The merchants of Albany N. Y., have opened a war on the old copper cents, the greatest nuisance in the currency of the country.

—Over \$70,000 have been subscribed to the fund for the establishment of Prof. Agassiz's proposed Museum of Natural History, in Boston.

—Souleque's prime Minister is said to have cheated the ex-Empress out of all his ill-gotten money, and is enjoying it at present in Paris.

—The propeller Hunter, first vessel of the season for Chicago, sailed from Collingwood Saturday week, with a full cargo and 20 passengers.

—A certain preacher, addressing himself to ladies who wear exaggerated hoops, said recently, "Remember how narrow are the gates of Paradise."

—A note from Paris, dated April 4, states that Senator Sumner had gone to Rome. He was, at last accounts, in a very bad condition of health.

—The statistics of Ohio for 1858, show that the number of suicides in that State was sixty in all, or one in every forty thousand of the population.

—Jerome Bonaparte, the survivor of all the brothers and sisters of Napoleon I., "still lives," at the age of 74. He was the youngest of the family.

—A proposition is before the California Legislature to set off all below the 36th parallel as a separate territory to be united to Arizona, or to form a new State.

FIFTH YEAR OF THE ENTERPRISE

FOR 1869.

ROCHESTER, N. Y.,—FOR THE WEEK ENDING SATURDAY, MAY 7, 1859.

{WHOLE NO. 487.

MOORE'S RURAL NEW-YORKER,
AN ORIGINAL WEEKLY
RURAL, LITERARY AND FAMILY NEWSPAPER.
CONDUCTED BY D. D. T. MOORE,
With an Able Corps of Assistants and Contributors.

The Rural New-Yorker is designed to be unsurpassed in Value, Purity, Usefulness and Variety of Contents, and online and beautiful in Appearance. Its Conductors devote his personal attention to the supervision of its various departments, and earnestly labors to render the Rural an eminently reliable Guide on all the important Practical, Scientific and other subjects intimately connected with the business of those whose interests it exclusively advocates. It embraces more Agricultural, Horticultural, Scientific, Educational, Literary and News Matter, interspersed with appropriate and beautiful Engravings, than any other journal—rendering it the most complete AGRICULTURAL, LITERARY AND FAMILY NEWSPAPER in America.

All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

For Terms and other particulars, see last page.

OATS—VARIETIES, &c.

In our last we gave descriptions of the best varieties of Early Oats cultivated in England and Scotland, and now we propose to describe the late sorts.

The Late Angus Oat is the best of its class for growing upon all kinds of clay land. It requires an early sowing to insure perfection, and therefore some parts of England and Scotland are unsuited to its culture. It would ripen here, without doubt, in most localities, certainly where Indian corn could be grown. It produces a better crop than most of the early white varieties. The straw is very tall, strong, not easily lodged, and makes good fodder, and seldom sheds its seeds even in winds that would shake out other kinds. The grain is large, longish, and about two pounds lighter per bushel than the Potatoe or Sandie.

Grey Angus Oat.—This is similar to the last in its habit of growth, but the grains are larger and of a bluish-grey color.

Blainville Oat is the common oat of the South of Scotland, but it is much earlier than any of the other varieties of common oats, and therefore is suited to late districts. The grain is plump and roundish.

Hangingdale Oat.—This oat gives a good crop, and weighs about 33 pounds to the bushel. It requires sowing early on a warm soil.

Drummond Oat.—This is the common white oat of the central parts of Scotland. It is much shorter than the *Late Angus*, ripens about a week earlier, and the grain is rounder and seldom unshelled, except when grown too long upon the same farm. It is well adapted for heavy clay lands in good condition, as it is not easily lodged and seldom sheds its seeds, except in more than ordinary severe gales. It does not yield as well as the *Late Angus*, but is much liked, as the meal is very superior.

Bolton Oat.—This is the latest of all the common oats. It is well adapted for clay soils in early districts, yields well to the acre and weighs well in the bushel, is not so long-strawed as the *Late Angus*, but rather more so than the *Drummond*. It is of finer quality than either of the two last mentioned.

White Tartarian Oat.—The straw of this oat is very tall, straight and reedy, and not apt to lodge. The ear is bent to one side, but not so decidedly as the *Black Tartarian*, (an engraving of which we gave last week), and is also more straggling. The grain is long, of a dull white color, very plump, but light in the bushel. It requires a good soil, either of black mould or peat.

Common, or Old Black Oat.—is a very old variety, now not much cultivated. It is a good variety to sow on newly broken up land, as it is easily, profitable and not liable to be overcast by the late frosts.

deteriorates, both in quantity and quality. No kind can stand unfavorable weather like the *Dun Oat*. There is a winter variety of this oat, but much inferior, cultivated in France and also in the South of England. In France it is some in September, and ripens in July.

We have now given the principal varieties of oats cultivated in Great Britain, condensed from *Morton's Cyclopedia of Agriculture*, and with such attention to varieties and their adaptation to different soils, and climates, to early and late sowing, and the changing of seed, as is there given, it is not strange that we have commonly reported in the English journals, oat crops ranging from sixty to ninety bushels to the acre, and weighing from forty to fifty pounds to the bushel, although we are well satisfied that our climate is much better adapted to this crop than either England or Scotland.

Mixing different varieties together for seed has of late years become very common and popular. The object of doing so is to obtain a heavier and more prolific crop, by taking advantage of peculiar habits of growth. Thus, when one variety is productive, but weak strawed and thin on the ground, it is common to sow with it a strong-strawed variety that will help sustain it, though less prolific. In this way a better crop is produced than one variety would give alone, with little danger of loss from lodging. From a series of experiments we observe that an increase by this means was reported in various trials of from eleven to twenty bushels.

To the subject of Oat Culture in this country, we propose to devote a column or two before long, and hope our friends, in all parts of the country, who possess valuable information on this subject will send it at once.

THE WOOL GROWERS' ASSOCIATION.

MR. MOORE:—In your issue of April 23d, I notice an inquiry of "What has become of the Wool Growers Association of Western New York?" As one deeply interested in the rise, progress, and fall of said Association, I assume to answer the inquiry.

From the hot bed in which the first seed of that Association germinated, to the winding sheet which finally wrapped it for the grave, it was fed solely by private hands and private subscription. The only direct application which the Wool Growers ever made to the State for a scanty pittance, was to aid this Association, and that was not asked for before it started, neither was it asked for while it was a yearling, but when it had assumed a name, place and interest, not only in Western New York but in general of the wool growing States of the Union. While the People's funds have been wantonly and ridiculously squandered by their representatives, not even the small pittance of \$500 could be obtained in aid of this great interest. Could it only have worn a political mask, it might have been honored and favored.

At the meetings of this Association I have met the wool grower from Ohio and Vermont, and the emissaries of the famous firm of LAWRENCE STONE & CO., each making the journey for no other purpose than to attend an exhibition of the Association. It is the only place where I have known of that famous firm making a direct attack upon the wool growers, and had they been met, and as completely vanquished in every other place as at that, they would never have had an opportunity to have squandered \$70,000 which did not belong to them. I really hope to see this institution revive, as, under the fostering hand of the State, it might be of great and lasting good to the wool growing community. Will not the *Rural* take an interest in its resurrection? T. M. YOUNGLOVE, Urbana, Steuben Co., N. Y.

REMARKS.—When we propounded the inquiry quoted by Mr. Y., we were not aware that the Association had ceased to exist as an organized body, but supposed it was only temporarily in a quiescent state—to become aroused and vigorous again in due season. We still hope nothing worse has occurred—that the Association not only "still lives," but will soon manifest the fact to its members and the large portion of community interested in its perpetuity. Hence, though our correspondent speaks of its "fall" and "winding sheet," we are not inclined to write its obituary until the time for its next Annual Exhibition shall have passed. If it is dead, and its members should attempt to effect a revival, an organization which, properly conducted, must prove of great benefit to the Wool Growers of Western New York. This is the more important, now that Sheep and Wool are profitable "institutions," and from the fact that the failure of our wheat crop renders it necessary to pay more attention to wool growing, stock breeding, grazing, &c.

The farmers of Western New York ought not only to sustain a Wool Growers Association, but also one to promote the interests of Stock Breed-

ing, &c. If the former cannot be sustained alone, or as a speciality, we would suggest an organization uniting the two objects, as they are closely allied. Why not form a Stock Breeders and Wool Growers Association—thus enlisting all interested in breeding Improved Domestic Animals and growing Wool? Breeding, Wool Growing, Grazing and Dairying, are annually becoming more important and leading branches of husbandry throughout a large portion of Western New York, and we are satisfied that an Association designed to promote these interests, would be of incalculable advantage. The very fact that a large proportion of the farmers of this region have comparatively little experience in stock growing—having devoted their principal attention to grain growing, until that branch became unprofitable—renders it vitally important to adopt proper measures to facilitate a change which seems inevitable over a large extent of country.

Since the midge has prevailed in this section, fruit growing has received a great impetus, and the organization of the Fruit Growers' Society of Western New York is one of the results of this change. The last annual meeting of that Society drew together one of the finest assemblages we ever witnessed—not in numbers, though in that respect highly creditable, but as composed of men of experience and ability in their occupation. The discussions (a synopsis of which was given in the *Rural*), demonstrate this, and that the information thus called out and disseminated must prove of great value to cultivators, not only in this region but other parts of the Union. Now, why may not the Stock and Wool Growers organize, and assemble at least twice a year—in the Summer to exhibit the results of their skill; and in the Winter for the purpose of discussing questions of vital interest, and the proper elucidation of which must vastly enhance their prosperity? We may be visionary in our suggestions, but hope the matter will at least be considered, with a view to action if thought expedient. We shall be glad to hear from those interested in the matter. We have in mind a score or more of stock and wool farmers, located in various sections of Western New York, whose opinions are entitled to weight, and who we trust will discuss the subject through the pages of the *Rural*, thus addressing the great mass of those directly interested in the proposition.

A PEEP INTO MODERN PHILOSOPHY.

The fields of Science are so numerous, and so many new conditions of elements meet the searcher after truth at every stage of progress, that he is almost universally compelled to give up his researches in disgust, and declare "God's ways past finding out." But modern philosophers are bold in their positions, and declare they "are clear and unquestionable, and can be supported by facts and arguments irrefragable." Polk "backed down" on the question in quotation, and the *Luxemburg* philosophers will back down on soil analysis. So far as practical results are concerned, said analysis is a naked fallacy. Science is only a new name for investigation—a side trail upon the great highway of knowledge. Analysis does not reach the creative power in the production of results, but merely discusses the existence of materials as furnished to an unknown power to work out magnificent results in the vegetable kingdom. The cause, the means employed—the channel through which fourteen distinct elements of vegetable life are used to produce a perfect head of wheat—are yet obscure to the eye of vegetable physiology. Investigation, notwithstanding it has assisted the cultivator of the soil to increase his crops in many instances, has, in a majority of cases, presented false theories. The fact that 100 pounds of wheat, when grown, contains 1 pound of phosphoric acid by analysis, does not demonstrate that the application of 1 pound of the same acid from the drug store returned to the soil, will, next season, produce like results. Or, if 1 pound of lime be forced into 100 pounds of wheat straw, by analysis, it does not prove that all that lime was drawn from the soil by capillary attraction, and that by returning the same amount of lime to the soil next season, like results will be secured.

The man who says to the tiller of the soil, "Show me 100 pounds of the soil you cultivate, and I can tell you how much lime, gypsum, potash and other elements are necessary to produce 20 bushels of wheat per acre," is an impostor, and deserves to be treated as such. The soluble materials of the earth, and the volatile elements of the atmosphere, are drawn into the plant by capillary attraction and atmospheric pressure, where the unerring laws of composition and decomposition are continually going on, by which these elements are transformed into straw and kernel. The amount of wheat grown at any given time depends much upon the state of the weather during its growth and maturity. If the season be excessively wet, there will be an over-

PREMIUM FARM HOUSE—No. III.

The Plan to which the Committee awarded the third premium, we this week present to our readers. It perhaps partakes more of the character of a Rural Cottage than a Farm House, though there are many farms where such a building would be very desirable, and few of our readers, we think, would object to such a house. The committee appointed for the purpose, considered it of sufficient merit to be entitled to the third premium, and *Rural* Editors and readers will endorse their decision. It was built and is owned by Wm. S. ENGAR, of Jacksonville, Illinois.

The outside appearance is attractive, light and pleasant, and not over-ornamented—a great fault with many modern houses. The rooms are large, and conveniently arranged. Every room of the

ground floor is pleasant enough for a parlor or a living room.

The great defect of the house, in the opinion of many, would be that it contains no bed-room on the lower floor. Such a room is needed, in case of illness, and is convenient, but difficult perhaps to obtain without reducing the size of the rooms, or destroying the arrangement. We know of no better way of arranging this matter than converting the Library into a bed-room, and occupying one of the bed-rooms on the second floor for a Library. We know of no objection to this change; indeed we think, in many respects, an upper room the best adapted for a Library, as its occupant is more retired and more secure from interruption, and less likely to be disturbed by the noise of children or the performance of the ordinary household duties.

Ground Plan.—D. R., Dining Room 13 feet 0 inches by 15 feet; Parlor, 16-9 by 14-6; Library, 15 by 14-6; Kitchen, 12-6 by 13-6; Wash Room 12 by 8; Hall 6-3 in width.

Second Story.—A., Bed Room 14 feet 5 inches by 11 feet 0 inches; B., Chamber 18-9 by 15; C. C. Halls; D. Bed Room 9-6 by 11; E. Bed Room 14-6 by 11; F. Servants' Bed Room 12-6 by 14-6; G. Passage 8-6 in width.

growth of straw and a diminished growth of grain. Visible facts clearly show that the 80 per cent of silica found in a wheat, rye, barley or corn plant, when ripe, is but a small part drawn from the "flint sand" of the soil, but crystallized in the plant from liquids and fluids drawn and compressed into it while growing. Then shall we stop investigation in this direction? Certainly not; but by giving more attention to visible results drawn out by the practical tillers of the soil—thoughtful, observing men—and less to the conclusions of speculative philosophers, sugar refiners and manufacturers of patent manures, we should approximate much nearer a substantial agricultural progression.

The man who grows 20 bushels of wheat produces 12 lbs. of phosphorus. Does vegetable economy teach that 12 lbs. phosphoric acid from the drug store, in its crude state, at a cost of \$25, should be returned to the soil? Such a course of reasoning would inevitably lead to false conclusions and disastrous results. Ground bones furnish silica in great quantities; and lime and ashes furnish nearly all the materials that enter into the composition of bones. By analysis, we have discovered that these materials exist in plants; but practical experience proves that they shall be returned to the soil to unite with vegetable materials, to make them available to the growing plant. Vegetation undoubtedly manufactures most of its silica from the unfixed alkalis furnished in the soil and decomposition of vegetable matter, and requires it in the condition

of soluble silicate, to be held by absorbents to be given up to the plants as required for crystallization. Leaves, leaf mold, muck and ashes are extremely valuable for this purpose. Silica is said to be the hardest of all earthy substances, and the most insoluble. "It may be boiled for hours in aquafortis, sulphuric and muriatic acids, without dissolving." I doubt that this is vegetable silica, or that it enters into the plant to any degree, during its growth. All the constituent elements which enter into the composition of vegetable life and growth, must be governed by the same elementary laws of astronomical science that govern the planetary system. The moment we commence investigating in this direction, we find that all the planets are revolving about the sun in one direction. We do not find them revolving about in opposite directions, but all sweeping around in the same harmonious order. It is held by many leading Astronomers that they might revolve about it in any direction and be sustained by the laws of gravitation. This phenomena cannot be explained by the laws of gravitation; and, in pursuing inquiries into the laws and operations of vegetable science, by soil analysis, we find many contradictions in the results obtained. I hold that we never are in a condition to decide when results contradict one another.

Now, when I reach this point in the investigation, it seems to me that there is some great law which presides over the elements and directs the

laws of vegetable physiology, which no rule of soil analysis can explain. A physical fact presents itself here, which demands our earnest attention to the condition of the natural and mechanical elements which surround us. All investigation beyond the reasonable circle of man's comprehension will be attended with wild speculations and conflicting results. Man is placed here in some sort of a circle, and knowledge is stretched out all around him. Within the compass of this circle only, representing the extent of his comprehension, is his knowledge complete and his experiments accurate. Within that circle alone can he reconcile all the different phenomena that present themselves to his vision; beyond that circle he will find everything in a new condition, and subject to different laws. But, forsooth, some bold adventurer strikes out into unknown space, where he discovers a glimpse of some new theory, as it presents itself to his amazed comprehension, and unfolds it to the circle as the discovery of some new fact. Another discoverer pushes out in a transverse direction, and beholds the same elements in another condition; and upon comparing results with the first, finds there is a want of harmony.—Astronomical science clearly demonstrates that all the elements that enter into vegetable life have existed in a gaseous state, have passed from a gaseous to the liquid, and from the liquid to the solid state. Now, it is evident that soil analysis cannot harmonize this confusion in the uniform or gaseous state, out of which nine-tenths of our vegetable materials are derived. Has there been one new idea established by soil analysis? There are two forces pervading the universe, whose harmonious co-operation in all the practical manifestations of the principles involved, make this world a cosmos, and not a chaos. In the material world, these forces are called contraction and expansion; in the vegetable kingdom, composition and decomposition. Every element in the universe has been brought down from a state of chaos to a state of cosmic refinement by the working of these laws upon the elements, whether in a gaseous, liquid or solid state. The production of a field of wheat or corn, is but the evident result of the working of these laws.

The fundamental laws of the universal elements may be called *practical and philosophical*. The formation and maturity of solid particles in vegetable composition, is the legitimate result of this practical law. Monstrosities in the natural and wonders in the visionary world, are the chance workings of the philosophical law, and this law is always out of gear to human comprehension.—Philosophically, we live to eat—practically, we eat to live. Physiology teaches that "once in seven years every particle of the human body changes." Philosophically this may be true; but practically it is a stupid non-truth: the scars and other external manifestations of the body follow the men of 100 years down to the grave. If no physical law can account for this identical phenomena, we flatly demur to the unwarrantable position. God is represented through all these laws, not figuratively, nor intermediately, nor consequently, but really, actually, practically, in all the positive attributes of his being. God is not a retired mechanic, who built up the vast complicated machinery of the universe, started its "perpetual motion," and left all results to the law of chance. But go on, Mr. Philosopher, we bid you God speed. Instead of holding down man's aspirations, instead of forbidding and checking his progress and his elevation to the most lofty and noble employment of man, (farming), we hold up to you the motto of the RURAL—"Excelsior!"

L. L. PINCK.

East Jaffrey, N. H., 1859.

CARE OF YOUNG LAMBS.

EDS. RURAL:—Is it necessary to lose more than two or three per cent. of young lambs? What little experience I have had goes to show that it is not. In the first place, select ewes with good constitutions, and keep them well. In raising young lambs, particular attention should be given to the little things. Frequently the milk of ewes, especially young ewes, is thick at first. The lamb is too weak to draw it, and after making a few fruitless attempts, gives up discouraged. He must now have help or be lost. Milk the ewe, and milk it into the lamb's mouth. Her milk will soon be thinner, and the nourishment the lamb receives from the food will soon stimulate him to help himself. See that the lamb's teeth are cutting easily; keep warm; feed the ewe plenty of roots if not at grass. If not owned by its dam, confine them for a short time and all will be right. Save the twins; raise them by hand if you lose no lambs; but in case you lose a lamb, let the ewe lie with the skin of the lamb, and keep the milk flowing until your twins appear, then put the skin of the dead lamb upon the twin, and pen it up with the dead ewe's dam. Cut their tails as soon as they get fairly straightened out; don't wait until the youngest are large enough, for then the oldest will be far too large. By carefully attending to these little things, in season, much may be saved in raising lambs.

A. S.

THE WHEAT MIDGE-EXPERIMENTS.

EDS. RURAL:—I noticed an inquiry in a late RURAL, from J. KIRKENDALL, as to what effect slaked lime would have sown broadcast on wheat. I will give my experience. Some three years since I got an idea, from some source, that slaked lime, sown broadcast on wheat when it was in blow, would destroy the midge. Consequently when the wheat was in the right stage, as I supposed, I dressed myself up for the occasion, and started for an experiment. I went to work on the back side of the lot, (so that my neighbors would not see me, of course), and commenced operations. I found it no boy's play to go in wheat as high as my head, and wet at that, and sown slaked lime broadcast; but as I was rigged for the business, I was bound to stick to it until I had sown enough to make a fair trial. About the time that I adjourned up came one of my neighbors from across the fields, and he had a good laugh at my plight, with my old clothes wet up to my neck, well coated over with lime. We sat and talked awhile, until I found the lime had commenced

KIRBY'S AMERICAN HARVESTER.—AS A REAPER.

Two weeks ago we gave an illustration and description of Kirby's American Harvester, as a Mower. The above cut represents the same machine as a Reaper, as it appears in operation in the field. Its advantages, and also its operation and construction, we give in the language of the manufacturers, as follows:

"One of the distinctive characteristics claimed for the Kirby Machine is, that it is a perfect Combined Machine. While there are many good mowers which are not good reapers, and many good reapers that are not good mowers, there are very few successful combined machines. Most farmers are not able to keep two machines, one for mowing and one for reaping, and yet every farmer ought to have a machine for each operation, and the single machine that will successfully perform both is a desideratum. With such a machine the farmer purchases a perfect reaper for only \$20; and if he has only one-fifth as much grain to cut as he has of grass,

he can afford to buy a combined machine. Indeed, the price of the Kirby Combined Machine is as low as that of many single mowers. Aside from the saving of labor in reaping by machinery, there is the further advantage of being able to gather the crop at the right time, whether laborers are scarce or plenty. The same machine can be also used to great advantage in gathering clover and grass seed. The following description of the American Harvester as a Reaper, will enable the reader to understand its construction and operation:

"All of the Kirby machines are combined machines, and the Reaper is the same as the Mower, with the addition of the platform, reel and raker's seat, and by merely bolting these to the Mower, (which is but a moment's work), you have a complete Reaper. The cutters, in reaping, can be set to cut at any height, thus adapting it to all kinds of grain, and to gathering clover and grass seed. The grain is delivered in well-formed gables at the

side of the machine, and entirely out of its way on the next swath. The raker's position is peculiar, and enables him to do his work with ease, he being placed at the side of the machine, facing obliquely the uncut grain, and in the center of motion of the rake, so that by an easy quarter-turn motion, or circular sweep of the rake, he delivers the grain in gables at the side of the machine. This position also enables him to control the grain as well without a reel as with one, and is the only position with which a machine can be successfully worked without the reel. In this position a boy can rake off all day with ease, and as soon as the horses get accustomed to the work the raker can dispense with a driver, and both rake and drive himself."

The manufacturers are also making a successful one-horse Harvester, called the "Little Buffalo Harvester," constructed upon the same principle as the American Harvester, which we shall take early occasion to illustrate.

Condensed Correspondence.

Mangel Wurtzels.

In looking over my books I find that my last crop of mangels yielded at the rate of eleven hundred bushels per acre, at a cost of six cents per bushel. My ground is a deep loam, and was well manured with stable manure. The wurtzels require no more care than a crop of corn, as they are a strong-growing plant. While young they soon get the start of weeds, and do not require as much weeding as carrots or bagas. The fly never troubles them, but they will not stand much frost in the fall. I usually plant the Yellow Globe variety, but either is good, and keep them until spring. As it is now time for farmers to arrange their crops, I would advise them to plant from a half acre to an acre of mangels for their stock. They are very nutritious, and I am satisfied the cheapest root that can be raised. I have raised a good many carrots and some bagas, but prefer mangels to them. Try them, brother farmers, and report the result.—W. G., Troy, N. Y., 1859.

Unburnt Brick Houses.

In the RURAL of March 12th a correspondent asked information relative to unburnt brick houses. Having perhaps had as much experience as any mason in this State, I will give it briefly. Eleven years ago this summer, I helped build the second house of that material, I think, that was built in this State. It was all the go then. It lasted about five years, in which time there were some fifteen houses built in this vicinity. The stucco then commenced clearing off with part of the brick adhering to it. There does not seem to be cement enough to the brick to hold it on. Several purposes to restucco this season, in the hopes of making the walls stand by driving in nails and letting them stick out about three-eighths of an inch. The great difficulty with them was the idea that the brick could be made of most any kind of material, and in most cases it was dug out of the earth just as nature mixed it. I think if they could be made of pure clay, and coarse sand and gravel enough mixed with them to keep them from cracking, they would stand. They should be laid up with lime mortar. Unburnt brick make a warm house in the winter and a cool one in the summer. They are non-conductors of cold or heat. If your correspondent has not had any experience, nor any of the mechanics in that vicinity, I would advise him to build with some other material.—N. H. ISBELL, Union District, Wash. Co., Mich., 1859.

About Hens and Eggs.

READING several inquiries and articles in the RURAL about Hens and Eggs, and having had some experience in the business, I will give you a few lines on the subject. I keep hens for the convenience of them. I have 16 hens; have kept an account of the eggs laid from March 6th to April 17th—six weeks. The first week they laid 71; second, 76; third, 66; fourth, 74; fifth, 78; sixth, 85. Cost of feed for the six weeks (one bushel of mixed corn, rye, peas and oats,) fifty cents; half bushel screenings, 13 cts.; half bushel corn, 40 cts.—total, \$1.03. My hens are a mixture of Golden and Silver Pheasants and Poland. I believe in a mixture of feed, but I want it mostly corn. I feed my hens all the broken earthen and glass they will eat—breaking it about as small as a pea or a kernel of corn. I never keep a hen over one year old for laying eggs. My hens seldom want to set before they are two years old. I have one hen that I keep for raising chickens. I set her twice last year—I put 17 eggs under her each time. She hatched and raised 16 chickens each brood. Keep young hens of a good breed, feed and water them regularly twice a day in the winter season and once a day in the summer, and you will have plenty of eggs.—A MACANIC, Akron, N. Y., 1859.

Rural Spirit of the Press.

Steeps for Seeds.

This subject, says the *Working Farmer*, has for a long time engaged the attention of many experimenters, and with various results. Strong solutions of any of the well-known materials used are apt to injure the germs of seeds, while weaker solutions, being held by the spongy coatings, frequently not only secure earlier germinations, but by a timely supply of necessary pabulum, secure vigorous plants, which, as a necessity of proper conditions in their early stages of growth, yield larger returns. Among the materials used we would enumerate the following: Saltpetre, Sulphate of Ammonia, Carbonate of Soda, Soluble Phosphate of Lime, etc.

Successful Turkey-Raising.

We have an example in the way of turkey-raising, by a woman, that is worthy of attention by some farmer's wives, who may perhaps go and do likewise. LYDIA ELDRIDGE, of Andover, Mass., writes her experience in raising turkeys, under date of Dec. 25, 1858:—"Last spring, my husband purchased a farm in this town, and I obtained one turkey, and she laid 24 eggs, hatched them all out at one litter, and I raised them all. Yesterday we dressed the last of them. The united weight of the whole when dressed was 212½ lbs; 198 lbs. were sold for a shilling a pound, New England currency, amounting in the aggregate to \$38. The whole number at that price would have amounted to \$55.41. Now, I think that is doing quite well, and if any body among your army of readers can do better than that, I think they deserve a premium; but until that is done, I think I can claim the palm."

Potato Culture.

A CORRESPONDENT of the *Southern Homestead*, gives the result of some experiments in the growth and culture of the potato, as follows:—"We have had some very pleasant and satisfactory experience in raising potatoes, from planting simply the eyes, just rimming them off with the point of a narrow knife. We selected the largest and best potatoes from the cellar, took out the eyes, and used the rest of the potato for the table, about as profitably as if the eye had not been taken out. They were then planted three in a hill, about one foot apart, and cultivated often enough to keep the weeds down, and to keep the ground stirred and mellow. The result was, we gathered a fine yield of large potatoes from every hill, with no small ones—a very important consideration in harvesting or picking them up. Besides, we had no diseased or unsound ones; although in the adjoining ground, where we planted whole potatoes, there were many unsound ones at the harvest. Hence, we believe, where there are large quantities of old seed to rot in the hill, it is likely to effect the young tubers unfavorably; and also where there is too much seed in a hill, it produces too many tubers, so that the young potatoes grow badly crowded, and, consequently, many of them must be small, and others become diseased. Here is a matter for thought and experiment."

WEATHER ITEMS.—There was a severe frost at Norfolk, Va., on Monday week, and the Day Book estimates the loss sustained in vegetables at \$50,000.

The thermometer on the western side of the White Mountains, at sunrise on the 25th ult., indicated seven degrees below freezing.

On Friday week there was a violent snow storm in Michigan.

They are complaining already at New Orleans that the weather is uncomfortably hot. Hereabouts it is uncomfortably cold for the season.

Agricultural Miscellany.

SPRING has come at last, and the long Winter of the farmer's discontent is made glorious Summer by bright sunshine and a balmy atmosphere. "Speed the plow!"

EARLY CUCUMBERS.—On the 24 inst., Mr. G. F. CHOMMAN, Seed Grower and Nurseryman, of this city, presented us with a full grown cucumber. That will do, considering the season—though of course grows in a hot-bed.

MIDDER-PROOF WHEAT.—We are indebted to ELISHA HARMON, Esq., of Wheatland, N. Y., for a specimen of growing wheat called Dayton or Weevil (Midge) Proof. The specimen is 23 inches long—tall wheat for this season of the year. Mr. H. has 70 acres growing, and will, of course, be able to report the result after harvest.

THE RURAL STORY, commenced on last page of this number, teaches a lesson worth reading and heeding by thousands of Ruralists. Though given in an early volume, we re-publish it in the belief that it will be new to most of our readers, and worthy of re-perusal by others. As a reason for deferring several excellent original sketches to make room for it, we quote what an Ohio friend of the RURAL and its objects says in a recent letter:—"I have one special request to make. Will you re-publish the story of 'The Twin Cottages'?" It was published in your volume for 1853. I don't know but you may think this asking too much, but I consider it one of the best stories (if not the best) ever published in the RURAL, and believe its re-publication will greatly subserve the object for which you labor." Read "The Twin Cottages."

THE PEOPLE'S COLLEGE.—The following note from the President of this Institution, located at Havana, N. Y., explains itself:

MR. MOORE—I am receiving letters almost daily inquiring when the People's College will be opened to receive students. Permit me, then, to notify your numerous readers that the work on the College edifice is progressing with due dispatch. But it is a great work to complete a building of its large dimensions, which must necessarily consume much time. It is not expected to get matters in readiness to open the College before September, 1860. Yours, &c., AMOS BROWN.

MARKET FAIRS.—The Massachusetts Board of Agriculture have been considering the feasibility of Agricultural fairs holding Market Fairs, and have voted "that the Board recognize the great importance of establishing frequent Markets or Fairs for the sale of Agricultural products." To aid in the development of the proposition, the Board have issued a circular, in connection with which is a prize essay upon "Market Days," by A. W. DOWD. The subject is to be examined in all its aspects by the Massachusetts agriculturists.

TO KILL SHEEP TICKS.—In answer to a recent inquiry in the RURAL about killing ticks on sheep, Mr. J. J. MOORE, of Point Abino, G. W., writes:—"My plan is to take a pipe, fill with plug tobacco, lay a cloth over the bowl of the pipe, part the wool over the sides and around the neck of the sheep, and blow the smoke in next to the skin. It will kill the ticks."

BLACK QUARTER OR BLOODY MURDER.—A PREVENTIVE.—MR. GEORGE DAVIS, of Chongoco Co., N. Y., sends us the following:—"I have raised cattle for over thirty years, and for the first twenty lost more or less calves in the fall of almost every year—those that were the best and in the best condition. For the past ten or twelve years, however, I have been in the habit of giving soap, salt and ashes, in troughs, once or twice a week, and since I adopted the practice have not lost an animal from the black quarter."

A CURE FOR THE HORN AIL (so called) is given as follows, by Mr. ISA COMSTOCK, of Salisbury:—"Take of good vinegar and spirits of turpentine one gill each; of salt and pepper (red or black) half a gill each. Stir these together and apply them as warm as your hand will bear, between the horns, winding a cloth around the horns, near the head, in order to retain as much of the compound as may be. One application is sufficient in ordinary cases, but where the case is obstinate a repetition may be necessary. I have used this remedy nearly twenty years, and never knew it to fail."

REMARKABLE FERTILITY IN A COW.—MR. M. B. FORBES sent the London, (Eng.) *Veterinarian* the following particulars relating to the birth of five calves at one time:—"A cow of the short-horn breed, six years old, the property of Mr. RICHARD ENIGHT, farmer, Santon, about a mile from Ryegate, was safely delivered on Monday morning, the 21st of February, three weeks before her time, of five calves—four bulls and one cow. Three of the calves died a few hours after birth, but the fourth survived until Tuesday, and the fifth until the following day, Wednesday." Mr. FORBES saw the cow on the 23d, and found her going on well. It was her third calving.

ENDURANCE OF THE HORSE.—Some cruel experiments have lately been made at Paris to test the endurance of horses. It appears a horse will live on water alone five and twenty days; seventeen days without eating or drinking; only five days if fed but unwashed; ten days if fed and insufficiently watered. A horse kept without water for three days, drank 104 pounds in three minutes. It was found, too, that a horse taken immediately from "feed" and kept in the active exercise of the "squadron school," completely digested its "feed" in three hours; in the same time in the "conscrip's school" its food was two-thirds digested; and if kept perfectly quiet in the stable, its digestion was scarcely commenced in three hours.

EXPORT OF EGGS FROM FRANCE TO ENGLAND.—A curious statistical return has lately been made of the supply of eggs to England from France, by which it appears that the annual value of this export to that country exceeds that of wine. Even before the oldum disease, the difference in value in favor of eggs amounted to 101,072 francs yearly. In 1815 there were imported into England from France 1,800,915 kilograms of eggs; in 1856, 9,005,756 kilograms; and as each kilogramme is calculated to be equal to eighteen eggs, it follows that France furnishes England with 200,000,000 of eggs annually.

CHINA TEA WHEAT.—Inquiry.—I wish to inquire through the RURAL, of its readers, if any of them ever knew the China Tea Wheat to be injured by the midge. I have not been in the habit of raising spring wheat till last year, when I sowed a piece of Tea Wheat. The seed not holding out, I finished the piece with Canada seed—all sown on the eighth of May. After heading out I watched it very close, and never found any midge in the Tea, but the Club was entirely destroyed by them. Both were struck with the rust. I have inquired of a number of old farmers and not one of them ever knew the Tea Wheat to be midge eaten. If we can't find anybody that ever did know such to be the case, we shall be safe in sowing it early.—J. J. B. Lockport, N. Y., April, 1859.

THE SEASON.

For a week or two past the weather has been very cold and unpleasant; so much so as to check and almost suspend vegetation. On the 23d of April we had a heavy snow storm, with considerable frost, followed by cold north and east winds. Banks of snow were to be seen in shady places a week afterwards. For three days past, (now May 2d,) we have been favored with warm, growing weather. The peas, lettuce and other early vegetables are making a rapid growth; the apricots in warm situations are in flower, the cherry blooms are just bursting their casements, and the apple trees are fast becoming spangled with green.

In the flower garden, we are about taking our farewell of the *Crocus*. On the 18th of March we picked the first crocus this season, (the Cloth of Gold,) and to-day the *Lute Yellow* and *Cloth of Silver* are in flower. So these flowers, which are generally considered as short-lived, have cheered us for forty-five days, or nearly a quarter of the season of flowers.

The *Nicotiana* will not be in perfection for a few days, though there are many charming varieties in full flower, and they are now the ornament of the garden. The *Narcissus*, the *Early Tulips*, and the *Fritillaria*, are opening their gay petals, and of these we shall make note next week.

All garden work should now be pushed forward with the greatest rapidity. There is no time for delay, neither is there much danger from late frosts in most localities. If you have anything particularly choice that is tender, sow only one-half of the seed, and reserve one-half for a later sowing.

PROFITS OF A GARDEN.

No portion of a man's time will yield a greater profit in soil-culture, than that spent in the vegetable or fruit garden. To illustrate this, I will give a little experience in raising early potatoes, and contrast the actual result with an estimate of the probable success in raising that vegetable in the field. On the 26th of March, 1859, a square of four rods in my garden was planted to early Mercer potatoes. Rows one foot apart, tubers six inches apart in the row. Quantity, three gallons—seed finely cut. Soil stiff clay, heavily coated with ashes, barn-yard and poultry-house manure. They came up well, grew rapidly during the heavy rains of May and June, were not overtaken by the drouth and striped-bug, (which ruined those late planted,) but were ready for the table July 4th. The product in bushels is, we regret, not known. A family of eight persons were supplied until the season for late potatoes. If 10 bushels grew on four rods, one acre would give 400 bushels. The entire work on this plot would not be more than one day of a good hand.

Now, we will suppose that these potatoes had been planted in a field of ordinary fertility, and the rows three and half feet apart, tubers ten inches apart in the row, they would have occupied more than one-eighth of an acre. Hoeing alone could not have been less than three times that of the first instance. Considering the unfavorableness of last season, we are satisfied that time would have been wasted, labor thrown away, and land unprofitable. In short, potatoes not worth gathering. Had the season been auspicious, the clear gain would sum up two or three hundred per cent. in favor of garden over field culture, with this vegetable. The rule that it pays to make the soil rich, is equally applicable to the whole farm, and holds good in every variety of produce in the vegetable kingdom. Let no husbandman neglect his garden under the impression that time can be more profitably employed in grain growing. Let him calculate in dollars and cents the amount saved (by lighter weat and store bills,) by keeping his table well supplied with the various esculents found in a good garden, and he will find that health and economy speak out in favor of closer attention to such "small matters."

McDonough, Delaware, April, 1859.

REMARKS.—The above we fully endorse. Any farmer can make or save more from half-an-acre in a vegetable garden, than from any three acres in cultivation on the farm. Early potatoes, peas, beans, cabbage, cauliflowers, squashes, lettuce, radishes, beets, with the small fruits, which are so easily and so cheaply grown, make excellent summer living, without much aid from the store.

APPLE PIE MELON.

MESSRS. EDs.—In response to an advertisement of mine in the *RURAL* of the 19th ult., a great number of your subscribers and readers have desired me—when ordering the seeds—to give them some ideas as to growth, uses, etc., of the Apple Pie Melon. This has been quite impossible from want of time, but, if friend Moore will allow me, I will instead give them a few hints through the *New Yorker*, which may also be of some service to those who have not so requested.

The *Japan Apple Pie Melon* comes to us—as its name would appear to indicate—from Japan. It looks not unlike an *Orange Water-melon*, and has a similar habit and growth. It is equally as hardy and as easily grown, and a very prolific bearer. I raised one last year that weighed 45 pounds, and several over 20. The flesh is very firm, compact and white, with a very thick and hard rind, and keeps well through winter. Makes good preserves, and is said to make good pickles.

In preparing this melon for pies, it should be peeled and cut into small pieces. These should be boiled until they look like stewed apples. Add a small quantity of sugar, although this is not essential, as it is sweet enough to many tastes; flavor with a little lemon juice, and make into pies. The most acute epicure will discuss this genuine "apple pie" with all the relish of the real. By the

A SMALL AND CHEAP VINERY.

In England much is being done to popularize gardening by the introduction of such cheap appliances as are within the reach of the masses, are easily managed, and that afford a good deal of amusement if not much profit. The last thing of the kind we notice is called *The Curate's Vinery*, a glass frame, hardly worthy to be called a vinery. Why this name we cannot say, unless it is that curates are generally acknowledged to be a poor class, and can afford no more costly buildings. In no country that we know of are glass frames more useful than in our own. Our springs are so uncertain, so changeable, that a glass covering of any kind, be it only a simple box or hand glass, is a great advantage in forwarding melons and other tender plants, that require a long season to bring them to maturity, or that it is desirable to have fruit early. Then, for lettuce, radishes, &c., a glass frame, such as this *Curate's Vinery*, is very desirable. But, to the description of this house, which is from a little book by Mr. Rivers.

"The annexed figure will convey a correct idea of its shape and make. To form a vinery of this description, some dry place in the garden must be selected; if not naturally so, it must be well drained. A dry gravelly or sandy border, gently sloping to the south or south-west, will be found a favorable site; a flat surface will, however, do well if fully exposed to the sun.

"When the site is determined on, a trench should be dug, two feet wide on the surface and fifteen inches deep, sloping on each side to the bottom, which should be six inches wide; the bottom must be paved with tiles, placed lengthwise, and the sides lined with the slates called Duchesses, also placed lengthwise.

"On each side of this trench, on the surface of the soil, a row of bricks must be placed two inches apart, end to end, leaving spaces between each brick two inches wide—these are for ventilation. On these two rows of bricks the roof is to be placed, which would be a ridge of the following dimensions: 2 feet 5 inches wide at bottom, and 15 inches deep from the centre to the apex. It should be made in lengths of 7 feet, two of which, placed end to end, form one vinery 14 feet long. Each length should be glazed with four pieces of glass; and as each sloping side of the ridge is 20 inches deep, four pieces of glass, about 20 inches square, for each side will be required. The two outer ends must be closed with boards; at one end a notch should be

added of milk and eggs, omitting the lemon, you have a fine custard.

This melon is destined to be one of our most valuable acquisitions from abroad, since, from it, pies of most unquestionable flavor may be made, equaling the good old-fashioned apple pie, or the rich and creamy pumpkin or custard, and this, too, at a time when apples are scarce, while it is equal to the finest citron as a preserve, and I am told is well adapted for pickling.

Morrisania, N. Y., 1859. C. V. RAPAPTE.

REMARKS.—No doubt this *Apple Pie Melon* will make a good pie if enough good things are put with it to make it good, but of itself it is destitute of flavor, and its only merit, in our opinion, is that it has no bad taste, being very much like citron, or watermelon rind. We think very little of it.

EFFECTS OF A SOUTHERN EXPOSURE.

MESSRS. EDs.—Noticing in the *RURAL* of April 9th a recommendation from S. N. HOLMES to plant grape vines on the south side of a house, I would say that my experience has been unfavorable. About the spring of 1850 I set a plant of the Catawba and one of the Isabella on the south side of my house, building for each a trellis, giving the best of opportunities, both as regards planting and cultivation, but thus far with intolerable results—a few pounds of fruit in one season only. I have no difficulty in producing a rampant growth of vines, with leaves, in some instances, ten and twelve inches in diameter, but the difficulty is, they invariably winter-kill close to the ground. The young wood starts up strong and vigorous each spring, continues growing till late in the fall, then perishes in the winter. These results may be confined to my own experience, but I had determined to remove my vines this spring to less sheltered positions, hoping thereby to check their late fall growth, and enable them more fully to mature their growth. Is there any remedy for the evil complained of? G. M. REYNOLDS.

Corunna, Ohio, Co., Mich., 1859.

REMARKS.—A southern exposure is the very worst that could be selected for any vine in a climate where it is liable to be winter-killed. But we doubt whether you could ripen the Catawba in any other. The better way would be to plant hardy varieties that would not winter-kill in such a position, or early sorts that would ripen with a different exposure.

PRESERVING FRUIT.—1st. Will some friend tell me whether fruit can be preserved in brown earthen jars, in the usual way of excluding the air by heating and sealing, with nothing but the cover placed on with grating wax? 2d. Will the acid of the fruit eat off the glazing so as to injure the fruit? Is the glazing poison?

We have kept fruit in common earthen preserve jars, but the bottles are better. We covered the top with a mixture of rosin and tallow. It is necessary to put paper around the edges to prevent the composition from entering the jar. Very acid fruit it is said will dissolve the glazing, which, in some cases, has proved to be poisonous. Even tin is apparently affected by strong acids, and all things considered glass is no doubt the best material for containing preserved fruit. On this matter we would like the experience of our friends.

cut in the board, to admit the stem of the vine, which should be planted outside, so that its stem is on a level with the surface of the soil outside the soil the vine is planted in should be well stirred, two feet deep, over a space six feet square, and enriched with rotten manure, and what are called one-inch bones, or 'bone dust.' The vine, when planted, should be introduced and suffered to grow, as in a common vinery, till it reaches the end.—Pruning on the spur system is the only method to be followed. To support the vine in the centre, pieces of slight iron rod should be placed across the furrow, two feet apart, resting on the surface outside; to these the stem of the vine should be fastened, so as to be under the center of the roof. The bunches of grapes will thus hang in the center of the furrow, and, owing to the radiation of heat from the slates and tiles, they will ripen well. I need scarcely mention that in pruning, either in winter or summer, the two lengths of ridge forming the roof must be taken off, and replaced when the operation is finished.

"There are several garden purposes to which these simple structures may be applied. I fill my trench half full of rich mold early in November, and plant in it Endive and Cabbage Lettuce for winter and early spring Salads. In gardens where these glazed roofs are not wanted for vines, they will be found most useful for these and other plants. They may be placed on any warm border on the surface of the soil, and early Peas, French Beans, and many other early vegetables requiring protection from spring frosts, be grown under them with advantage. In all cases they should be placed on bricks, with spaces between them."

The cost of this little vinery is 25 shillings for fourteen feet in length, in England, about six dollars. The editor of the *London Gardeners' Chronicle* is highly pleased with it, and says:—"To how many purposes may such a little seven-foot span be applied when the owner is tired of his vine experiment. Mr. Rivers mentions some; but there are many more. Bringing forward a row of Strawberries, for instance, or a line of Asparagus, or spring Onions, or Radishes, or sheltering small matters in winter, such as Endive or Winter Spinach, or Lamb's Lettuce. For all such purposes the glass roof, taken off its vine trench, will be found very far better than handglasses or cloches, or such devices. For ourselves, we have already set a carpenter to work up some old materials."

SETTING HEDGE PLANTS.

When your ground has been well, deeply and thoroughly mellowed, strike two straight parallel shallow furrows one foot apart, with the dirt thrown right and left from the furrows, where you wish your hedge to stand. Then your plants should be set in the furrows so as to make two straight parallel lines one foot apart with the plants from ten to twelve inches distant in the rows, set in such manner that the plant in one row shall stand opposite the space in the other row—thus:

Then, again, set the plants at an angle of forty-five degrees, or leaning over half way from a perpendicular towards the earth in the direction of the rows—thus:

Both rows need not lean the same way. By setting plants in this manner you can make a hedge of the Osage orange, the common native buckthorn, the willow, or cottonwood; either of which will make a good hedge throwing up several more perpendicular shoots than when set in the usual upright manner, and when well grown forming a dense, strong and reliable fence.

We must depend upon the living hedge for fence at the West, in place of the reliable stone walls of the land we have left, and no very long time will elapse before we shall be forced by stern necessity to pay that attention to hedging which we should now give from choice, that we may be in readiness for the time when hedge fencing will be a yet greater need than at present. W. H. GARDNER.

Amboy, Ill., April, 1859.

THE PEAR ORCHARD.

EDS. *RURAL*.—As this is the season for transplanting fruit trees, I wish to call the attention of your readers to the cultivation of the pear on the quince. In June last I gave you my experience in the cultivation of three thousand trees, five hundred of which were standards, upon their own stalk, and twenty-five hundred more dwarfs, all of Duchesse D'Angouleme. I would not set over five or six varieties were I to set an orchard of ten thousand trees, and these should consist of the Duchesse D'Angouleme, Louise Bonne de Jersey, Beurre Diez, Bartlett, Easter Beurre, and the Vicar of Winkfield. I would grow the Seckel on its own roots, and in some localities I would set the Virgalieu. Our nurserymen are growing too many varieties for orcharding purposes. The above varieties have all done well, and the fruit was not blasted last year, when other kinds were cut off. I had some 100 kinds that I have fruited. In planting set the quince entirely below the surface, so that the pear wood will be at least two inches below the surface of the ground.

The question will naturally arise, what kind of soil would you plant your trees upon? My answer

is, upon any soil where you can raise good corn or wheat. In planting an orchard of dwarf trees I would never set them over eight feet apart each way, one acre will then contain 680 trees, and you can cultivate them with as little trouble as it would take to cultivate an acre of corn, with the exception of pruning.

I do demur to the short pruning recommended by Mr. BAAR and others, leaving only three or four buds to each limb. I would never take off or cut back over one-half of the previous year's growth. You must have size to your trees before you can get much fruit. I have obtained from 1½ to 2 bushels of pears from my trees which are 10 years' planted this spring, and 2 years old when planted. Manure well, keep the grass out of your orchard, and you will not be troubled with your trees being eaten up with mice. Any man that will set out and cultivate an orchard, is a benefactor to his race, and future generations will call him blessed.

Bochester, April, 1859. LEWIS HURT.

YANKEE HORTICULTURAL CRITICISM.

A CORRESPONDENT of the *Albany Statesman*, in describing a stroll through the Central Park, now being laid out and planted in New York City, says:—"As I was strolling along I came to a wet, somewhat marshy spot, where men were engaged in setting out some plants adapted to moist ground. Knowing the plants by name I was somewhat surprised at the selection, when a raw Yankee stepping up and looking a moment burst out into a loud laugh. 'Well, that beats all,' said he, 'poke root and skunk cabbage,' by jimmie. Settin' out poke root and skunk's cabbage in New York, and then he roared. 'Why,' said he, 'we try to get rid of those pesky things up our way.' The fellow was right—they were setting out poke root and skunk's cabbage, by way of adornment to a little dirty ditch. Seeing I had come across a genuine specimen, I entered into conversation with him, and told him the object was to imitate nature. 'Imitate nature!' he exclaimed, 'why don't they get a live skunk then, and tie him here—that will be jinnuine natur, and strong too. If they are so fond of natur, I s'pose there is a place somewhere about here where they've got out Canada thistles and mullein stalks. I went out yonder to see 'em drainin', and I tell you it's tall drainin', but it wouldn't pay up our way. But what do they want to drain it for, if they want it like natur? Natur has made lots of swamp up our way.' I asked him if he didn't think they had managed the rocks nicely? 'Why,' said he, 'they've dressed up these darned rocks just like they do their children—why don't they blow 'em up?' He went on criticising one thing after another, but the spectacle of three grown men setting out poke root and skunk's cabbage was too much for him, and as he swung along the gravel walk I could hear him say, 'By golly, if that don't beat all,' and then he made the air ring with his rollicking laugh."

SPARE THE BIRDS.

A LITTLE while since I was crossing over the field and saw a nest with three dead birds in it, which were about half grown. I do not know what brot' the little, innocent things to so sad an end, but I could not keep the thought out of my mind that most likely some boy had wantonly killed the mother bird while she was in pursuit of food for her little nestlings. If that be so, and that boy could have heard those harmless birds cry for food, he would have been sorry for his cruel deed and I hope would never repeat an act so wicked. They were blue birds. I lingered at the nest and tho't how many, many miles the wings of that mother-bird had borne her from her sunny winter home to the pleasant grove where, perhaps, she had before built her nest and reared her young—how she was the first bird of spring—and my heart was sad at her cruel fate. Could that boy but realize that *He* who gave that bird such beautiful plumage and such sweet notes of melody, and taught her to fly away to the sunny South as winter draws on, and then to return when the cold frosts are past—that, he saw her when she fell, he would weep at his wanton and wicked deed. It is sad, indeed, that there are any who, for amusement, will molest or destroy the nests or silence the soft and joyous notes of our little birds.

In many countries birds are treated very kindly and are never killed for sport. Several American officers, while in Japan, started off across the fields and commenced shooting the birds. The Japanese who saw it, were shocked at such wanton cruelty, and at their earnest request Commodore Perry put a stop to it. The act of shooting a few birds had such an effect upon the Japanese, that in their treaty between the two countries they made a condition that the birds should be protected.

There is perhaps, no country where the birds are so wantonly destroyed as with us. Almost every boy seems to think himself licensed to destroy as many as he pleases, and they too often go unrebuked. Many boys grown to the stature of manhood, still rove over the fields and shoot every bird within their range. The useful little things are frightened away from the habitation of man and seek the dark wood and distant fields for protection. The birds are driven away and vast multitudes of insects swarm in the air and settle upon and destroy the fruit and every beautiful plant. The insects are the natural food for the birds. Let the birds live and they will destroy the insects. They are beautiful and their song is pleasant:

"Spare, spare the gentle birds,
Nor do the warbler wrong;
In the green wood is heard
His sweet and holy song
His song so clear and glad,
Each bird that's heart is stirred,
And none, however sad,
But blessed that happy bird."
Syracuse, N. Y., 1859. N. F. G.

ISABELLA GRAPES IN APRIL.—We received, April 21st, from NELSON HATCHER of Holley, N. Y., several bunches of Isabella Grapes in fine condition. Such grapes, at this season of the year, are, beyond question, a great luxury, and yet it is one very easily obtained. A few weeks since Wm. ROADES, of this city presented us with excellent Catawbas.

TO PRESERVE ORANGES, CAKE RECIPES, &c.

MESSRS. EDs.—Noticing an inquiry in a late issue of the *RURAL* for a good recipe for preserving oranges, I send one, together with some for cake-making, which I think very good:

TO PRESERVE ORANGES.—Boil oranges in clear water until you can pass a straw through the skin; then use three-quarters of a pound of sugar to a pound of oranges. Reduce to a syrup and pour over the fruit while hot, let them stand one night, then boil until they are clear and the syrup thick. Take from the syrup and strain it clear over them.

SPONGE CAKE.—Five eggs; one tumbler white sifted sugar; one tumbler of sifted flour; two even teaspoons of cream tartar; one-half teaspoon soda—pulverize the cream tartar and soda together and sift with the flour—little salt and one teaspoon extract of lemon—the yolks and whites of the eggs to be beaten separately.

WHITE CAKE.—One pound sugar, three-quarters butter; one pound flour; six eggs; one cup sweet milk; two teaspoons cream tartar; one of soda; season with nutmeg or rose-water. The butter and sugar are to be stirred to a cream, and the yolks and whites of the eggs to be beaten separately.

RAISED CAKE.—Take one and a half tencups buttermilk, and one teaspoon soda, stir as thick as common emptings, put where it will keep warm over night; next morning add three eggs; two tencups sugar; one do. butter; three teaspoons soda; raisins and spice to taste. Let stand about an hour before baking. Roll the fruit in flour before putting it into the cake.

CREAM CAKE.—One egg; one cup sugar; one cup sour cream; even teaspoon soda; a little salt; season to taste.

LOG CABIN CAKE.—One cup butter; two cups sugar; three cups flour; four eggs; one teaspoon soda; one cup sweet milk—spice to taste. This should be spread as thin as possible on pie tins well buttered—as soon as baked spread jelly over the top of each loaf, and put one above the other,—this will make two loaves.

SODA CAKE.—Two eggs; two cups sugar; two-thirds cup butter; one and a half cups sweet milk; two even teaspoons cream tartar; one of soda; four cups of flour.

MOLASSES COOKIES.—Two even teaspoons soda; two tablespoons of cold water; two tablespoons of butter; fill the tencup with molasses; two tencups for a baking.

SUGAR COOKIES.—Four eggs; one and a half cups sugar, nearly one tencup of butter; a little soda, salt and nutmeg.

FRIED CAKES.—Three eggs; one cup sugar, one cup sour cream; one and a half cups buttermilk; one teaspoon soda. ANNIEA.

Manlius, N. Y., April, 1859.

BEANS FOR DYSPEPTIC BACHELORS.

Here is a recipe for cooking beans which agrees well with a dyspeptic friend of mine, and will be found excellent by others beside the "Dyspeptic Bachelor." Soak a quart of beans in cold water over night, in the morning boil slowly till they can be squeezed between the thumb and finger; then pour the water off, or drain through a colander, and put them in a deep dish in which you have previously put a tablespoonful or two of sweet cream or milk, a teaspoonful of sugar, and a little salt. Fill the dish with water to prevent burning; cover it, and bake three or four hours.—Mrs. E. M. V., Seneca Co., N. Y., 1859.

A "BACHELOR" wishes to be informed the "best mode of cooking beans." It strikes me that beans are not just the right sort of diet for a "Dyspeptic Bachelor," and I am surprised that some philanthropic and kind-hearted sister did not at once offer some friendly suggestions, for a man laboring under two or three previous complaints should not be neglected. As no one has yet "come to the rescue," I will try to give as good advice as possible. I would suggest the strictest regimen, confine yourself to brown bread and crackers, (a little bean soup now and then if desirable,)—ride vigorously at least five miles every day on horseback, (as it is supposed you possess at least one of those serviceable animals, and as soon as you find yourself gaining make the acquaintance of some substantial farmer's fair daughter, and make known to her your trouble,—dwelling more particularly on the bachelor part,—and my word for it, in less than six months your dyspeptic habits will have gone to "the dogs," and you will have a wife that will know how to "cook beans" in all possible ways, and you can then de-light your eyes as well as palate. She can place a platter of cold baked beans and pork before you once a week—for the washing-day dinner if you like. Try it, it is at your service.—Miss A. M. B., Pavilion, N. Y., 1859.

DEAR *RURAL*.—I saw in one of your columns that M. C. A. wishes to know the best method of cooking beans for a "Dyspeptic Bachelor." As you submitted the question for a reply, and no one has responded, I thought I would give him one of my ways, and as I am somewhat dyspeptic, and rather old maidish, too, perhaps can fix up a dish that will suit his stomach and taste. Take a quart of white beans, put them in a clean bag, not very thick, boil until done, then take out the bag, and fix the water for a bean soup, by putting in cream, butter, salt, when boiling, to make the beans good, pepper if liked, then turn into a dish with crackers split open, which will give all a good flavor. The beans will be very nice and meaty. M. E. Castle, N. Y., 1859.

LOAF Pudding.—Tie up a pound-loaf of baker's bread in a cloth, and put it into boiling water with considerable salt in it, and boil it an hour and a half. Eat with cold sauce.

"PROGRESS AND IMPROVEMENT."

[SINGLE NO. FOUR CENTS.]

VOL. X. NO. 20.

ROCHESTER, N. Y.,—FOR THE WEEK ENDING SATURDAY, MAY 14, 1859.

[WHOLE NO. 488.]

MOORE'S RURAL NEW-YORKER,
AN ORIGINAL WEEKLY
RURAL, LITERARY AND FAMILY NEWSPAPER.
CONDUCTED BY D. D. T. MOORE,
With an Able Corps of Assistants and Contributors.

THE RURAL NEW-YORKER is designed to be unsurpassed in Value, Purity, Usefulness and Variety of Contents, and unique and beautiful in Appearance. Its Conductor devotes his personal attention to the supervision of its various departments, and earnestly labors to render the RURAL an eminently Reliable Guide on all the important Practical, Scientific and other Subjects intimately connected with the business of those whose interests it so assiduously advocates. It embraces more Agricultural, Horticultural, Scientific, Educational, Literary and News Matter, interspersed with appropriate and beautiful Engravings, than any other Journal, rendering it the most complete AGRICULTURAL, LITERARY AND FAMILY NEWSPAPER in America.

All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

SPRING NOTES.

On a Spring Note are not such as greet the ear and cheer the heart these beautiful spring mornings,—notes of melody, songs of joy and praise from feathered choristers,—but plain, practical, homely notes, far less beautiful but fully as profitable, perhaps, to the farmer.

Corn Planting.

Corn is very liable to rot in the ground if planted too early; or if it does not rot it comes up yellow and sickly, becomes stunted, and makes but little growth until warm weather. As a general thing, we have no doubt corn planted from the twentieth of May to the first of June will ripen as early as though planted before that time, while the chances of success are much greater. No crop is more benefited by a little attention at the early stages of its growth than corn. A little manure in the hill just before the first hoeing, will show itself all through the season, and tell a profitable tale at harvest time. For this purpose we take especial care of our best manure, and it is almost equal to guano. The Crows and Wire-worms destroy a good deal of newly planted corn, and, in addition to these, our friends at the West have the uniformity of their planting very much destroyed by gophers. The best security against these depredators that we know of, is to coat the seed before planting with tar, then roll in plaster and ashes. The tar should be mixed with hot water, so as to give the seed but a thin coating. One way we have seen practiced, is to put the corn into a tub of scalding water, let it remain for five minutes, then pour off most of the water, add the tar and stir until every kernel is coated. One excellent farmer we know of always adds a little sulphur, and claims great advantage from its use. Another remedy is of a benevolent nature, and yet like a good many benevolent acts, is founded on selfishness. This is to scatter corn on the surface of the ground, and, of course, while enough to satisfy their wants can be gathered on the surface, the birds will not disturb that which is buried in the soil. But, whether such a course will not cause an extra number to congregate for the enjoyment of the feast, is a question we cannot answer, though we know this course is relied on by some of our friends to preserve their seed corn, after planting, and they claim that it is successful. Our idea of this remedy when first announced, was, that the operator would be somewhat in the situation of the man who undertook to catch squash bugs and kill them, he declared that killing them only made matters worse, for when one was killed a dozen came to the funeral.

Potato Planting.

Early planting is necessary to success in potato growing, as a general rule, though occasionally our seasons are such that those late planted do best. The vexed question, whether it is best to plant large or small potatoes, cut or uncut, in hills or drills, or level, we will not now attempt to discuss. On these subjects there are different opinions among practical men,—and the few reliable experiments we have noticed seem to tell different stories. We have seen and I doubt not that a small potato, if planted in a hill, is good for seed, but if it is intended for a second or fall growth, then it is better to cut it. We are taking a good deal of interest in the potato question, and hope in the fall to discuss it in an interesting article. The correctness of the opinion of the *Rural New-Yorker*, has been called in question, as it is supposed by some

to be the true *Early June*. The sound, white potato, poor and watery, commonly known and sold as the *Early June*, is, we have no doubt, the *English White*. Then we have here several sorts sold as the *Early Manly*, and we find it difficult to trace out their origin, or give them correct names, or even to judge of all their qualities. All of these early sorts we now have planted side by side, and we think we are in a fair way to obtain some light. CHAUNCEY E. GOODRICH, of Utica, who has given more attention to potato culture than any man in the State, or perhaps in the country, and to whom we are indebted for a variety of seedlings for trial, gives the following directions:

"Soil.—This should be but moderately rich, at least in an unsteady climate like ours. A sandy soil heats and cools too readily. A stiff clay soil is too close. A loam soil is best. A new soil with much woody matter in it is good. For this reason, stiff greenward and well-drained swamps, furnish good soil for potatoes.

Exposition.—High hills, and even mountains are favorable places for the cultivation of potatoes.—Level ground, or slopes to the west or north are more favorable than slopes to the east or south. On the east slope they heat too rapidly after a cold night, while on a south slope they heat too much at noon. We err in planting potatoes in the same soil and position with corn, melons, &c., unless constrained by the want of one that is cooler. In the Southern States they have learned to put the potato in their coolest soils. But potatoes need a well-drained soil as much as corn.

Culture.—Do not cut your seed small, nor plant a seed too deep. The reason is plain. Such seed gives a feeble plant, which grows too slowly for the best work, and so does not bear the succeeding weather, nor tuber as early as it ought, especially if it be a late sort. It is true that where your variety of potatoes ripens quite early, the cutting of seed very small will give a much larger crop for its weight than in the use of larger seed, but it is not, in the end, as well for the health of the crop. Plow and plant deep, except you are obliged to use a heavy or wet soil. Thus the roots are cooler in hot weather, and chill less in sudden changes. They also stand drouth better. Cultivate at level. A high hill heats and cools worse than a level one. Plant wide, usually as wide as 3 by 3, and often more. Thus every hill has its share of light and air. The rule should be to have your ground just covered when the vines get their full growth.—Plant early. Then the vines make a slower and more hardy growth, having less spongy and more woody matter in them. They will thus stand bad weather better than when rapidly grown. Use early sorts. Then the tubers get ripe before the dark, damp and cool weather, which is always felt in the parallel of Boston and Chicago, and often early in September. The weather that produces early chills and disease, has almost always come in the first half of July. Potatoes of tolerable constitution which have been cultivated as above directed, usually escape in this chill. Very early sorts should not be sought for the main crop. It is sufficient that the sorts for winter use should mature with the season. If, however, you wish to cultivate for early market or fall feeding, you may force your potatoes in a rich soil, and reap a heavy crop, but do not use such for seed. Indeed, potatoes with a vigorous constitution may be cultivated without immediate harm, in a rich soil, but the tendency will always be to weaken their constitution. In a good soil—one adapted to the growth of all ordinary vegetables, your seed potatoes never need changing, especially if they be sorts ripening in good season. If your soil be deficient it may be well to change seed with those who have a better soil."

The Best Crop to "Seed Down" with.

In an article on *Oats, their Value, Culture, &c.*, we incidentally remarked that the *Oat crop* was one of the best with which to seed down to clover. A correspondent calls our attention to this statement, thinking it may mislead, as many farmers find oats bad to seed down with, far inferior to wheat in this respect. The remark was made with the fact in our mind that wheat culture is about abandoned for the present in Western New York, and if farmers sow clover on grain it must be on some other crop than wheat. But, some persons write as though they supposed there was something in some grains antagonistic to clover, if not actually poisonous. Our view of the matter is this. For the good of the clover it would be better to sow it thick and alone in the spring. We have sown clover and grass for lawns and parks, early in the spring, and by the first of July had the surface entirely covered a beautiful green carpet.—The thicker the grain grows on the ground, the more it abounds in leaves to increase the shade, and the longer it remains the more injurious to the clover. Of course, the grain stands on the ground, the less does the shade, and the sooner it is removed the better for the clover. It

this view is correct, and we believe the experience of most practical men will corroborate its truth, then there need be no question as to what grain crops are best to sow clover upon.

BRIEF FARM HINTS.

Those of us who do our principal farming in the editorial "sanctum," may be expected to avoid many disgraceful errors into which out-door cultivators are prone to fall. We never let thistles, burdocks, and other noxious weeds, go to seed on our premises; the boards are not off from our barns, and unsightly rubbish don't accumulate on our premises—(this may be slightly exaggerated, but we will assume it for argument sake); our cattle are not poorly fed; our plowing is not of the "cut and cover" kind, and our planting is not out of time. We are therefore the men to exhort others to the performance of duty.

Will you not then, this Spring, go into a general clearing up about your fences and buildings of those unsightly accumulations which have annoyed your wife and daughters so long, and in your more susceptible moments brought a very little color into your own cheeks? If that old hay rack is worth anything, would it not pay to carry it away to some shelter? If it is fit for wood, suppose you burn it in-doors, and if not, burn it somewhere. Ditto that horse-rake, plow, old sled, old wagon, and cultivator.

Are you through with those plum trees, covered with black knots and dead limbs?—then, for your country's sake, if not for your own, burn them or try Mr. Dickinson's remedy, (given in *Rural* of April 9th); by all means, kill or cure them.

Circumnavigate your whole farm, and if you find in any fence corner a good rail, put it on the fence; and if you find stumps, stones, broken rails, or bushes, put them out of the way. Let every fence corner be ready for the scythe; then you will be able to gather much valuable fodder to store away for a scarce time.

Be sure and pick up all sticks and stones upon your newly seeded meadows—we will not insult you by supposing that your old meadows require anything of the kind—then roll them in a wet time, and you will have a good time with your mowing machine.

If you have omitted to dig about and dung your fruit trees, omit it no longer. Labor judiciously expended on fruit trees will meet with a large reward.

Be sure of one thing—your care and labors will increase upon you as the season advances, so see to it that your hay racks, reapers, mowers, &c., are at once put in order; otherwise you may wait for them at a serious cost. The right time for doing any branch of farm work is a brief time; so rapid are the changes of our seasons that a day or two's delay may spoil the profits of a large transaction. Therefore, *Be ready*.

Look to it that you are not putting off some indispensable business for a "convenient season." That time is never coming. Most likely you will be compelled to do it at a most inconvenient season. Getting a new buggy, a new hat, some new hoops for your wife, (there may be some doubt here,) will admit of delay—a new house may be waited for—but a new fence, a new plow, a new hay rack, if not provided at once, may result in serious loss.

It may not be too late to turn some rivulet on to your pasture or meadow, and so increase your grass. Irrigation is a much neglected, but very important operation in farming. Standing water, however beneficial to grass, is destructive of grain. See that there are no ponds on your grain fields.

See that your manure is either applied to your crops or guarded against waste from fermentation or exposure to the elements.

Look to your early sown vegetables, and keep the ground loose and the weeds under.

Don't neglect to hunt the eggs, and "set" the hens in good places, with the right number of eggs.

Keep your cattle from cold storms, and let them into the yard on cool nights to eat some hay, by way of change from the flashy grass.

Have you a good rain water cistern, with good troughs and conductors leading into it? That is among the indispensable and inalienable "rights of women."

Have you a good drain to conduct the surplus water of the kitchen to the compost heap, which of course is well supplied with the scrapings of the walks, muck, suds, &c. Have you gathered up the chips from your winter chopping, the splinters and small sticks, bits of bark, &c., which cumber the ground, and when dry are so useful to start the fire. Let these be carefully gathered and put in some dry place above the ground, ready for use.

See that your potatoes are sprouted and put into a dark, cool, dry place. See that there is no grain

BICKFORD & HUFFMAN'S GRAIN DRILL.

"Bickford & Huffman's Premium Iron-Cylinder Grain Drill" is probably the most popular machine of its class in this country, as it certainly is among the best, and by many pronounced the best. The proprietors have been engaged in the manufacture of Grain Drills for the past ten years, have made many improvements, and claim that the machine now offered to the public is the most perfect one in America. And we confess that their claim is well sustained by the testimony of numerous farmers and planters who have used the drill, and the fact that it has never failed of receiving the first premium at any of the many State, County and Town Fairs where it has been exhibited during the past four years.

The accompanying cuts, together with the following description by the manufacturers, will convey

of the relief which any one must appreciate who has sown guano by hand. It is acknowledged by all close observers, that one-half the quantity of guano usually sown broadcast, will suffice when sown with drills, and in the furrow with the grain.

"The principle and arrangement of this attachment is the result of much careful research, and numerous and costly experiments by us. The great affinity of guano for moisture, and its sticky nature when moist, renders it extremely difficult to be sown by a machine, and, in fact, all the machines heretofore introduced have failed to distribute guano, except when in a perfectly dry state. As shown in the cut, this distributor is simply a vertical shaft, with arms sweeping across the bottom of the hopper, their action is such as to loosen and render less compact the material to

GUANO ATTACHMENT TO BICKFORD & HUFFMAN'S GRAIN DRILL.

an intelligible idea of the construction, operation and capacity of the Drill and its Attachments:

"This drill will sow any desired quantity per acre, with the utmost precision, (as has been often tested,) from 4 to 16 pecks, by changing the gear wheels, which are marked to designate the number of pecks each will sow. It is also constructed to plant corn or beans in drills, by shutting off the grain from as many drills as desired. We have in our possession certificates from many practical and scientific planters and farmers, recommending

be sown, also to comminute and move it over and into the discharge apertures. The great simplicity, as well as durability of this attachment, together with its certainty of action with guano and other fertilizers, either in a dry or damp state, render it certainly the most desirable machine yet offered to a discerning public. This fixture will also distribute lime, plaster or ashes, either in drills with the grain, or broadcast without the drill tubes. (Plain and perfect instructions on a printed card accompany each machine.)

THE GRASS SEED ATTACHMENT.

our drill for planting corn, and it is believed to be the only Grain Drill so constructed as to perform this work in a satisfactory manner. It may also be used as a broadcast machine, by simply removing the drill tubes. We are manufacturing three different sizes of Drills, 7, 8 and 9 Tube; the Drill Tubes are placed in two rows, thereby facilitating their passage on stony or lumpy ground. The single row form, however, is preferred on all lands properly prepared.

"The Guano Attachment, with the late improvements, will sow, with the grain, from 50 to 300 pounds of guano to the acre. The desired quantity may be regulated with accuracy, by a slide and notches. Where set at the first notch, it will distribute 50 pounds, and by moving the slide one notch, the quantity delivered will be 75 pounds per acre, and so on, each notch increasing the quantity 25 pounds. Here, too, is a great saving of expense in the use of the Drill, to say nothing

"The Grass Seed Attachment can be used without the grain drill or the guano attachment, or with all these in connection, performing in one operation the work of many men and teams, and other implements, viz.:—It sows your grain more perfectly than can be done by hand; it distributes your guano and other fertilizers more perfectly and economically than can be done by hand; it also sows your grass and clover seed broadcast behind the drills, after the work of sowing and manuring is performed, more evenly than can be done by hand, and all with one man and team. It will distribute from two quarts to one-half bushel to the acre, in the most perfect manner, can be quickly thrown in and out of gear, or removed entirely from the drill when not required."

It may be proper to add that this Drill is manufactured only by the Patentees and Proprietors, Messrs. BICKFORD & HUFFMAN, at Macedon, Wayne Co., N. Y., and Baltimore, Md.

LEAF MOLD.

If any country reader of the *RURAL* who owns a farm has never penetrated the banks of leaves that lie against old logs and in sheltered nooks and corners in his woods, let me advise him to lose no time in doing so, and I assure him that a sight of what he will find buried there will more than compensate for the trouble. Brushing aside the dry, rustling leaves that cover the underlying mass, keeping it constantly moist, and thus assisting decomposition, he comes, first, upon a closely-packed layer of dead foliage, always wet from the latest rains, and emitting that peculiarly clean and agreeable odor,

or other eatables left in by-places, to be consumed by rats and mice. Make vigorous war upon these enemies of the human race, before they escape into the fields to recruit for next winter's campaign.

Put away in a dry, airy place, plenty of good, tough timber, suitable for hoe handles, rake teeth, whiffletrees, wedges, pins, plow handles, &c., &c.

Cast up and see if you are getting behind with any item of business; and if so, prove yourself equal to the emergency—employ more help, or double your diligence, and fetch up somehow. Be sure if you can't "afford" to do a thing at the right time, you can't afford to do it at all.

perhaps never possessed by decaying vegetable matter under any other circumstances. Below this, lies a strata of once green leaves, now half-dissolved by long-continued dampness, still retaining their form in a considerable degree, but yielding to the slightest effort to tear them in pieces. Descending deeper, the moisture decreases, and he finds a substance in color and texture much resembling fine-cut tobacco, consisting of separate, distinct particles, the whole curiously threaded with the yet undecayed veins of leaves; and, lower still, of almost velvety softness, lies the finest, cleanest, smoothest, prettiest dirt imaginable, if that can be called dirt which fingers of the most delicate touch experience a sensation of real pleasure in handling.

If the explorer, after pursuing his investigations thus far, experiences anything of the wonder and admiration I anticipate for him, and possesses, in the smallest degree, the zeal of a curiosity hunter, he cannot resist the wish to carry away a specimen of his new-found treasure; and if nothing more convenient to gather it in he at hand, he will carefully collect and tie up in his pocket-handkerchief a few handfuls wherewith to puzzle and surprise those at home whose ignorance of this substance is probably as great as his own was an hour before. Then, after passing it round for examination, if he remembers to have read of its good effect on grape vines, strawberry vines, blackberry and raspberry bushes, &c., he will most likely bestow his sample on some favorite plant and determine to improve the first opportunity to go with his team and fetch home, for the benefit of his young trees, vines, bushes, &c., a quantity of this said-to-be-excellent, and certainly most interesting fertilizer.

So much beauty as lies hid in one of these rich deposits of mold ought not to be unmasked without plenty of appreciative eyes to witness it. Especially, be sure to have the children present when the precious heap is opened. The revelation of its contents, accompanied by some account of the slow and curious process by which the wonderful pile accumulated, would afford them heartier delight than many a novelty they are carried miles to see, while the exercise of helping collect in baskets this substance, which, considered in its origin or in itself, is as beautiful and as surprising as a miracle, would yield a vast amount of innocent and healthful enjoyment. There need be no difficulty about a provision of implements for taking out the contents of this aylvan laboratory; children would as soon pick up acorn cups, chestnuts, walnuts, or apples, with a pair of tongs as gather such pretty stuff as leaf mold with any other tools than hands.

Individuals or parties visiting the woods for rural enjoyment, may make an examination of one of these neglected leaf banks a most pleasant and instructive incident of their excursion. They will scarcely find, in the course of a day's ramble, anything better worth their attention, or longer to be remembered. Even the curious inquirer into Nature's secrets is here presented an interesting subject for investigation. A common observer could give only a rough guess (it would probably fall quite below the mark) concerning the length of time a particular mold-bed has been forming; but the nice, critical, scientific searcher goes carefully to work, separates and removes, with caution, each successive layer, as distinguished by the different stages of decomposition they have reached, and by his skillful anatomy, arrives at a tolerably accurate estimate of the number of years through which the dead leaves showering down from the surrounding trees have drifted against the huge log where they lie, each fresh deposit burying deeper its predecessors, itself, in turn, the subject of like sepulture, and transformed by time and damp into the very poetry of decay. Truly, there be some things belonging to Earth that never lose their beauty, and leaves are of them; we do not know when to admire them most—in life, in death, or in dissolution.

South Livonia, N. Y., 1869.

THE TWO ENDS OF THE HORN.

EDS. RURAL:—I lately ventured into a piece of extravagance, viz., subscribed for the RURAL, and as you invite farmers to write to you, I thought I would send you a few items of my experience—showing my poor success in that ennobling and glorious employment in relation to which orators and statesmen make so many profound and Buncombe speeches, and editors, political, literary, and agricultural, say so many beautiful things. If success is sounded forth, and by means of the press published to the ends of the earth, should not want of success be as widely disseminated, that the world may strike "the happy medium?"

If the fact that the Hon. A. D.'s cow had two beautiful Durham calves at a birth, which he promptly refused to sell for \$500, goes the round of the papers, ought not the conflicting fact to be published as well, that Hon. A. D.'s neighbor J. E., after feeding out all his fodder, tried in vain to get his cow up May hill, and all he could save was her hide, which he sold to the tanner, lost all the world buy cows, and go to raising calves under the impression that they can sell them for \$350 apiece? If the papers publish the statement, that C. CACKLE, Esq., from 4 parent birds raised 19 pairs of Brambling chickens, which brought him \$5 per coop, and also supplied a small family with eggs—making, by nice figuring, a clear profit of \$30 in one year,—ought they not also to publish Farmer Squire's emphatic statement that his 20 imported fowls are a curse to him—that the "taral critters" eat themselves up four times in the course of a winter, requiring a bushel of corn per week—that they scratched up two acres of corn for him in the spring, besides destroying his garden, tangled down three fourths of an acre of oats in harvest time—that he has never a chick to keep, nor eggs enough to pay for looking them up?

If we must needs hear that Mr. BIRK killed a pig ten months old, weighing 100 pounds dressed weight, would it not be as well to be apprised of the fact that Mr. EAST, on the adjoining farm, next day killed ten of the pointer breed twenty months old, averaging 100 lbs.? If a cow's milk is put into sixteen pails, and raises half a bushel of an common fine large potatoes, which he by business calculates to be at the rate of 700 bushels per acre, and the papers blow it broadcast, should they not give a few puffs to the equally conclusive and prac-

tical experiment of B. who planted 3 acres with 25 bushel of the same kind and harvested 100 bushel per acre of inferior potatoes?

If Prof. PACHYDROMUS, having sowed a plot of highly manured land, three yards square, with a foreign variety of wheat, and having guanoed and plastered the same, finally reaps and threshes it, and by nice measuring and figuring triumphantly demonstrates that it has yielded at the rate of 74½ bushels per acre, and immediately sends to Constantinople for a cargo of the same for seed, has his name, experiment and speculation heralded abroad for the public good,—for the same reason ought not the subsequent experiment of Farmer SIMPUS to receive a like publicity, and be sounded in the ears of an expectant public? He reads Prof. P.'s experiment, receives Prof. P.'s circular, gets excited, takes to figuring, buys 20 bushels of P.'s wheat at \$5 per bushel, sows it, and takes to dreaming—dreams of harvests both of grain and dollars and cents. The land is ordinary, the season ordinary, the harvest less than ordinary.—SIMPUS'S dream is over. He now takes to thinking. Thinks he is a fool; thinks Prof. P. is a knave; thinks farming is a bore.

Let us hear both sides. If there is sunshine, there are shadows; if there is honey, there are humble stingers to defend it; if there is fruit, so are there thorns; if there are ups, so are there downs. And it was in relation to some of these downs in my experience that I took my pen to address you, but I must defer it until another time.

JERADIAH EAST.

Red Creek, Wayne Co., N. Y., 1869.

REMARKS.—If Mr. EAST'S initial blast is a fair index of his promised "experience," RURAL readers may expect some items tending to enable them to strike "the happy medium." But we submit that, notwithstanding his fine exordium, it is always wise to "breed from the best"—to take your cow to the best male bovine—and that care in the selection of sires and seeds, as well as a little extra expenditure in securing them, (with corresponding pains-taking in breeding and culture,) will generally pay large dividends. The cases cited by friend JERADIAH are extreme ones, and—but we will await his conclusion, and see which end of the horn is the largest.

BRUSH UNDERDRAINS.—THE OTHER SIDE.

FRIEND MOORE:—I have been an ardent friend, a constant reader, and I suppose my name has been on your books as a subscriber for your valuable RURAL for eight years. I have read accounts of a number of experiments made by correspondents after one year's trial, which have proved their experience or conclusions to be erroneous. They jump at conclusions in the outset, whereas they should "wait a little longer," or until they know more positively whereof they affirm.

In the RURAL of April 80, our friend W. L. JONES, under the head of "Cheap Mode of Underdraining," says that for the want of tile he made use of brush. After his drain had lain for one year he examined the brush, found it as fresh as when first put in, and says—"Now, sir, this brush will last for at most twenty years, and my drains will have only cost the price of digging."

Now, sir, I call this jumping at conclusions—for sixteen years at least. Six years ago I laid about eighty rods of brush drain, the same way as Mr. L. I have a field of five acres, sloping to the south at about 6 inches to the rod—wet, spongy, the soil mostly producing grass. Having plenty of brush, I tried the experiment of brush draining. I cut a ditch two feet wide and 18 inches deep. Commenced to put in brush at the mouth of the drain, but ends foremost, the tops resting on the butts of the others. The thickness of the brush was ten inches, covered with a coat of straw, put inverted turf on the straw, then filled in with earth thrown out of the ditch. I plowed deep; the season was dry; plowed no more, but cultivated often. Sowed to wheat, Sept. 4th; harvested a good crop.

I felt as much overjoyed as does W. L. L. at his success in cheap draining, and put about 16 rods in each branch, draining into a large open ditch. The first and second year it worked well. The third year, however, the water made its appearance through my brush drains, on the top. I examined them; found them pressed together, and the earth from the top filled into the brush, completely choking the drains. The fourth year I dug them out, and let the water have free course. W. L. L. says you may probably hear from him again on the subject of draining. With due respect I advise him to wait six years, and then report progress.

Stafford, N. Y., May, 1869.

E. BIRBY.

MOON FARMING.—AN INQUIRY.

EDS. RURAL:—I have recently become a reader, and consequently an admirer of the RURAL. I consider it one of the "institutions" of the American farmer. One of its happiest and most instructive features is the interchange of thought it elicits from its numerous readers throughout the country, giving each an opportunity to benefit his brother farmer by his own experience. It is emphatically the people's paper, the farmer's instructor, and as I am one of your pupils I beg the privilege of asking a plain question through its columns. It is this—What time "in the moon" should we sow our seed this Spring, to insure a good crop next Fall? It is held by many good and wise people, that sowing the seed in the "wrong of the moon" has a disastrous effect upon the crop; if this is so it is time we all understood the theory and philosophy of the fact. If Mrs. LUNA smiles upon a seed one day, and frowns upon it the next, it behooves us all to study her disposition. Again—it is said this very fastidious old lady is immoderately particular about her diet, especially pork, "shriveling it up in the pan," if it is not killed just the time her fancy dictates. Soap is also under her especial care, and obstinately refuses to "come" except at her bidding.

Now, Mr. Editor, I ask this question seriously, for I am in a dilemma. I have heard that certain seed ought to be sown either in the full or old of the moon, and that it would either come up or rot,—I have forgotten which. Will some of your kind readers please tell us how we can call down the blessings, and avoid the curses, of this crop, pork, and soap regulator, Mrs. LUNA?

Nelson, Mad. Co., N. Y.

D. D. HOLDBRIDGE.

PORTABLE STEAM ENGINE.

The above cut represents a Portable Steam Engine, as manufactured by A. N. Wood & Co., of Eaton, Madison Co., N. Y., whose reputation as builders is well established throughout the country. The uses to which these engines may be applied upon a farm, are various. Upon a large farm or plantation, where much grain is threshed, wood sawed, &c., they are considered almost indis-

pensable. They are convenient for steaming milk for dairy purposes, and feed for fattening stock—for running a grist mill, grindstone, washing-machine, corn-sheller, sausage-cutter, &c. The steam may also be used for heating shops, tanneries or buildings where stoves are not safe or convenient. See announcement of the manufacturers in our advertising department.

Rural Spirit of the Press.

To Compel a Cow to Yield Her Milk.

A CORRESPONDENT of the *Country Gentleman*, having taken a lesson from the calves, states that in every case a cow may be made to let down her milk by striking the udder with the clenched fist. He says:—"When a boy, my business was to suckle the calves night and morning. I noticed after the calves were of some size, and when first admitted to the cows, and after, when the milk was nearly exhausted, particularly if the supply was scant, that they made a most vigorous butting of the cow's bags, causing them to kick about lustily." From this he took the hint, and has never failed, by a judicious use of his fists, to bring the milk speedily down from the most obstinate holders up.

Dairy Salt.

S. P. JOSTLYN, of Whitesfield, Vt., sends to the *New England Farmer* the following method of preparing dairy salt:—"Take the best crystal salt, wash it, dissolve, strain, settle, and turn off; boil it down in some perfectly clean iron vessel, skim as boiling; when stirred off dry, it will produce fine salt, white as the drifting snow, which, if stirred up in a glass vessel of water, will produce no sediment, and will be distinct from any mineral or other possible impurity. Salt is offered in the country markets for from one and one-fourth to one and one-half cents per pound, which looks like the model of perfectness. After the above method of manufacture, it will cost nearly double that amount. For two years past we have manufactured salt in this way for the produce of about three tons of butter each year." This mode was introduced to Mr. J. as being practiced by an experienced Scotch dairyman, and such faith is placed in the purity of the salt after preparation, that Mr. JOSTLYN, after his two years' experience, purposes to continue the experiment.

"High Farming."

An Ohio correspondent of the *Prairie Farmer* gives it as his opinion that "what is done on a small scale, with ordinary means, may be done by the acre." To sustain this position he remarks that, "on a square rod of land, occupied for the second year only as a garden, and consequently well manured, a neighbor raised, last year, nine bushels of carrots—or at the rate of more than fourteen hundred bushels per acre." Taking this as his text he gives us the following brief discourse:—"Did any one ever fully appreciate the value of a single bushel of carrots to a cow giving milk and making butter in winter? If so, such a one may understand the benefit which may be derived from a herd of twenty cows, the whole of which receive a half bushel per day each all winter from a crop of fourteen hundred bushels. If worth twenty-five cents a bushel in saving hay, improving the condition, and increasing milk and butter, the whole crop would be worth \$350. Yet the cost of raising need not be \$100, at ordinary prices of manure in most localities. 'High farming' in some matters will not pay, but it will eminently do so in this; and one of the great points of skill in successful farmers, is to know when it will, and when it will not."

Dutch Butter-Making.

We are indebted to *Dickens' Household Words* for the following description of the process pursued in the manufacture of butter by the best Dutch dairies:—"There they come, the milkmaid and the boy. The boy is towing a little boat along the canal, and the maid, with her full blue petticoat and her pink jacket or bedgown, walks beside him. Now they stop; she brings from the boat her copper milk pails, as bright as gold, and, with a cooing greeting to her dear cows, sets down her little stool on the grass, and begins to milk. The boy, having moored his boat, stands beside her with the special pail, which is to hold the last pint from each cow; the creamy pint which comes last, because it has risen to the top of the udder. Not a drop is left to turn sour and fret the cow. The boy fetches and carries the pails, and moves as if he trod on eggs when conveying the full pails to the boat. When afloat, there is no shaking at all. Smoothly glides the cargo of pails up to the very entrance of the dairy, where the deep jars, appropriate to this 'meal' of milk, are ready—cooled with cold water, if it is summer, and warmed with hot water if the weather requires it. When the time for churning comes, the Dutch woman takes matters as quietly as hitherto. She softly tastes the milk in the jars till she finds therein the due degree of acidity; and then she leisurely pours the whole—cream and milk together—into a prodigiously stout and tall upright churn. She must exert herself, however, if she is to work that plunger. She work it!—not she!

Agricultural Miscellany.

MAY opened warm and brilliantly, the first seven days being exceedingly pleasant, with a higher temperature in this region, than has been experienced, so early, for many years. As a consequence, vegetation made most remarkable strides in garden, field and forest, and the Rural World is already decked in summer array.

FINE WOOL.—Mr. E. MASON, of Tyro, N. Y., has favored us with samples of Spanish Merino wool of superior quality.

THE PERRY AND CASTLE AG. SOCIETY, (Wyoming Co., N. Y.) has the following officers:—President—ALFRED PALMER, Perry; Vice Pres't—Walter Gillespie, Castle; Sec'y—B. M. Howard, Perry Centre; Treasurer—Russell Mordoff, Perry.

WARTS ON ANIMALS.—O. H. W. writes thus:—"Here is a cure for warts on animals cheap, and easy of application. I saw a young horse with a bad wart in the face, which was entirely removed by a few applications of common pine tar—just rubbed on."

A CONVENTION OF WOOL GROWERS AND MANUFACTURERS is to be held at Cleveland, Ohio, on the 4th of August next. The Ohio Farmer says the "call" is signed by many of the most prominent wool growers in that State—that the premiums will be quite liberal, and a pleasant and profitable meeting may be expected.

THE SPRING SHOW AND STOCK EXHIBITION of the Niagara Co. Ag. Society, held at Lockport on the 4th inst., is said to have been largely attended, while the display made, particularly of horses, was large and unusually fine. We are surprised that more of our County Societies do not hold Spring Exhibitions.

THE FOURTH ANNUAL FAIR of the St. Louis Ag. and Mech. Association is to commence on the 25th of Sept. next. Among the premiums offered are the following: For the best thorough bred stallion, \$1,000; for the best thorough bred bull, \$1,000; for the best roadster stallion, in harness, \$1,000. Liberal premiums, those, and such as ought to call out the best.

MILKING YOUNG COWS.—It is said that young cows, the first year they give milk, may be made, with careful milking and good keeping, to give milk almost any length of time deemed desirable; but that if they are allowed to dry up early in fall, they will, if they have a calf at the same season, dry up at the same time each succeeding year, and nothing but extra feed will prevent it, and that but for a short time.

EXTENSIVE POTATO GROWING.—A paragraph is going the rounds of the papers stating that a Mr. SPOONHART, of Sturgis, St. Joseph Co., Mich., has already planted fourteen hundred acres of potatoes! Though it may be true, we beg leave to doubt the statement until some of our subscribers in Sturgis verify its correctness. We suppose more potatoes are grown in this (Monroe) county, than any other in the Union, but if one man cultivates 1,400 acres in St. Joseph, and others imitate him to any extent, the banner must change locations. Our growers do not plant many hundred acres each, but they manage to obtain a good many bushels of superior potatoes per acre.

ABOUT STRAW CULTIVATION.—The *Prairie Farmer* says:—"Mr. FIELD, of St. Louis, called on us last week on his way to Sonoma Falls, N. Y., where he has contracted for the building of a steam engine, which is to work a series of spades, by which he intends to cultivate the prairies of Illinois. His machine is to be completed the 16th of June."

"Mr. FIELD, referred to above, has recently seen FAWKES' new steam plow, and says it will not astonish him to hear within six weeks that FAWKES is breaking up fifty acres of Illinois prairie every twenty-four hours. His machine will soon be completed. Mr. F. speaks of it in high terms—believes it will be a success."

"NOVA SCOTIA CORN."—We are indebted to Mr. D. B. WAITZ, now of Springfield, N. Y., for a sample (ear) of corn, of which he tells this history:—In 1855 he picked an ear from the stalk on Rock River, Ill., it being the second growth of that year; took it to Minnesota, (in latitude 45 degrees,) and planted in garden; from thence brought seed to New York and planted last year, and this ear is part of the product. It was called "Nova Scotia Corn" in Illinois. It came well—not uncommon to find three ears on a stalk, and one on top of each ear. Does well for early table corn. Planted it the 22d of May last year, it was tasseled 26th June, and used as green corn for dinner on 29th of July. Soil not favorable, (clay, cold and wet,) light coating of stable manure plowed under, and no extra culture. Mr. W. proposes to distribute the seed to any wishing to give it a trial—sending on receipt of letter stamp, all the postage will cover. Don't think he intends to "speculate," or would not notice. The ear is small, eight-rowed—and, though it might do for late planting, in case of emergency, hardly think it a desirable variety for profit.

TARRING SEED CORN.—"Hending" the Crows.—Writing to the *New England Farmer*, E. MANSFIELD thus speaks of the benefit of tarring seed corn, a process frequently recommended in the RURAL:—"Tar applied to seed corn before it is planted, certainly will prevent the crows destroying it. For more than forty years I have not been able to detect a single failure, wherever it was done correctly. Not one person in ten would probably be successful in their first endeavor in tarring corn; to be known, the operation must be seen. One man dare not use boiling water, so he falls; another destroys the vitality of the kernel by too great a degree of heat long continued. I have known parts of fields destroyed by poisonous manures, when this single fact was overlooked, and tar, or the birds, was erroneously supposed to be the cause. Could some President of an Agricultural Society, or some pattern farmer, be induced to try the experiment of tarring seed corn, I doubt not that in less than ten years, scarecrows would be among the missing."

The editor of the *Farmer* adds the proper mode of tarring (substantially the same as has been several times given in the RURAL, and which we know has been practiced successfully by a number of "pattern farmers") as follows:—"President of an Ag. Society," as follows:—"Our neighbors practice in this way: They fill a pail half full of boiling water, add about half a pint of common tar—coal tar is just as good—stir it until the tar is melted and thoroughly mingled with the water, then add the corn, stirring it well for about ten minutes, or until it is completely covered with the tar. Take the corn out and roll it in plaster or fine ashes, and the process is completed."

Another Mode.—E. A. DAMON, in the same paper, tells "how to prevent crows from pulling up corn" in this wise:—"Take two ounces of nitre to a peck of corn; dissolve the nitre in half the quantity of boiling water wanted to cover the corn, then add as much beef brine, and soak the corn from twelve to twenty-four hours, then roll in plaster or dry ashes. I have followed this method for more than five years, and have suffered no loss from crows."

CATTLE STATISTICS.—In 1853 Illinois sent to the New York market 53,464 head of cattle, while the States of Ohio, Indiana, Iowa and Michigan together, only sent 53,025 head. Illinois is the greatest grass growing State in the Confederacy.

NOTES IN THE FLOWER GARDEN.

Could trees or plants be removed from the nursery or the woods to the garden or lawn in early summer, when the leaves are so brilliantly green and the flowers so beautiful and fragrant, then everybody with a rod or two of ground would turn planters. But, trees must be planted when destitute of their summer robes, when they have no beauty to recommend them. The work of planting, too, cannot be done, as a general rule, when the genial sun and the singing birds charm the dullest to an admiring sense of nature's beauties, and woo even the sluggish to the garden. This work must be performed when the winds are chilly, when the cold blasts from the ice-fields of the North numb the fingers, when the soil is damp and everything has an unpleasant aspect. The planter, then, must be a man of forethought, faith and patience—one who is willing to labor and wait for coming good, having confidence in the glorious promise that "seed time and harvest shall not fail." Our notes in the Flower Garden are taken when the plants described are in full flower, and will give the true character of each. These notes should be preserved, as they will be of great aid in making proper selections for next fall or spring planting.

HERBACEOUS AND PERENNIAL PLANTS.

PULMONARIA—(*Lungwort*).—There are several varieties of *Lungwort*, and they are among the finest ornaments of the garden at this season of the year. The name is probably derived from the fact that this plant is used in pulmonary complaints. They require a dry, sandy soil. The prettiest variety now in flower is the *Cerulea*; the leaves are of a lively green the flowers of the most delicate azure blue, thickly set, and forming a pendant raceme. The buds are like the lilac in color, which they also resemble in form.

PRINCE PROCEMBUS is a very pretty spring flower. As its name indicates, it is procumbent in habit, keeping close to the ground and sending up flower stalks about four inches in height, with fine clusters of red flowers.

The **DIELYTRA SPECTABILIS** is really one of the most valuable of all our new flowers. It is as hardy as an oak, an exceedingly free bloomer, without a fault that we know of, and good everywhere; in the parlor, the greenhouse and the garden. The flowers are curious in form, something like a purse, and some twenty of these curious bells are attached to a gracefully pendant foot-stalk.

The **SWEET SCENTED VIOLET** is the sweetest of all the early spring flowers, and like the Sweet Mignonette, it is a general favorite on account of its fragrance. A single flower will perfume a room; and often have we entered a room with a violet concealed, when in a minute the exclamation would be—"what a delightful fragrance." A cluster or two which any person can procure at a nursery for 25 cents, will make the garden deliciously fragrant from early in April until June. There are white and blue varieties, both single and double, but the double blue is the best. We give an engraving of this plant and flower. Herbaceous plants should be set out, if possible, in the autumn.

SAXIFRAGA CRASSIFOLIA.

SAXIFRAGA.—This is a genus of plants which are great favorites in English gardens, but are not very common in this country. The two best which we notice this spring is the *S. Crassifolia* and the *S. Obovata*. The leaves are thick and large and remain green all winter; but sometimes become so much injured as to be unsightly. The flower stem is from 8 to 12 inches in length, bearing very large, clusters of lilac flowers. Our engraving gives a very good idea of the appearance and habit of the plant.

FLOWERING TREES AND SHRUBS.

The **MAGNOLIAS** are the only ornamental trees in flower.

The **CONSPIQUA**, or *Chandalar Magnolia* is a Chinese variety, quite hardy in the Middle States, and is one of the most beautiful small trees imaginable for the lawn. It branches low, and is in every way desirable. To-day, (May 7th), it is in full bloom here.

The **PURPUREA** is another small Chinese sort. It bears its flowers before the leaves in spring. They are purple, on a light ground.

THE DOUBLE SWEET SCENTED VIOLET.

The **SOULANGEANA**, is a variety produced by crossing the two preceding. The flowers are white, tinged with purple. It is very hardy, and a profuse bloomer. It is now in full flower, and is the most beautiful object to be seen in our gardens.

FORSYTHIA VIRIDISSIMA.

The **FORSYTHIA VIRIDISSIMA** is now decked in its holiday dress. The flowers are of a bright yellow, rather loose and ragged, but clustering so thickly around the branches before the leaves appear, as to look very fine.

JAPAN QUINCE.—This charming early flowering shrub is now the gayest of all the shrubs. There are two varieties, bright red and rose-colored. Every collection of shrubs should contain both of these, for when planted together the effect is charming.

Our notice of bulbous flowers we must defer until next week.

PUT ON THE BRAKES.

Messrs. Eds.:—I have been listening for some years to your prudent advice and direction regarding things Agricultural and Horticultural, or rather, I have had my name registered with the thousands upon the subscription list of the *RURAL* for some four or five years, and there I intend it shall remain until I shall be removed beyond the reach of a newspaper, always provided (and perhaps I had as well left out the proviso), it shall retain its present high character. Thus long I have been listening—or rather reading—all that you and your numerous correspondents (some of them truly wise and prudent, but some few I fear are only self-wise,) have had to offer, especially upon the above subjects, to all of which I have endeavored to give the most earnest heed. Until now I have been a silent listener, having replied never a word. But, at the risk of having my communication consigned to the dead-letter-box, I have concluded to urge my claim to a brief hearing upon one or two points.

Some ten years since I commenced cultivating the grape, and have now in bearing about three thousand vines. Have just used the last of last year's crop, but have a little wine, second quality, in the cellar. I intend to extend my vineyard, and although less anxious than some of your correspondents about varieties, I, of course, wish to put out the very best sorts.

As yet (excepting a few plants experimental,) I have planted only Catawbas and Isabellas, believing, as Mr. N. Loxworth, of Cincinnati, assured me not long since, (no mean authority you will say,) that they were the only sorts to be relied on for general cultivation where they can be ripened perfectly. But, then, perhaps he knows nothing of the Franklin, or the butternut Ontario, or that other superlative seedling produced from the Franklin. By the way, allow me to say that I think you have hit some of the grape puffers about right, and I am surprised that other Horticultural Journals should allow interested parties to make such untrue statements without one word of caution to their readers. But perhaps the subscribers of such Journals put no confidence in them, and therefore are not misled or cheated by this silence, or half-way endorsement. The readers of the *RURAL*, however, have confi-

dence in its editors, and believe they will guard their interests. At the same time we will take care that our good *RURAL* does not suffer by doing battle for the right. Never fear or regard the threats of interested humbuggers. They may all say, as one did, that you will "make nothing by such a course," but be assured no other course can win. Doubtless, you are fully aware of this,—you know it has won, and you will not doubt that it will win every time. The fact is, these enthusiastic cultivators of seedling grapes are running wild, and unless you put on the brakes smartly now and then, thousands of us who are uninformed, but anxious to get posted, will be badly humbugged. We look to you to keep us right. See that you do not give the trumpet an uncertain sound.

I have some dozen or more different varieties, besides some worthless seedlings of my own raising. For some I paid high figures, and I find them generally of small account, just as I expected. Mind you, I do not wish to discourage experimenting for new sorts, by no means. On the contrary, I am experimenting myself, and shall continue so to do. I hope and expect to see other varieties produced worthy of extensive cultivation, but let cultivators remember that the *ISABELLA* and *CATAWBA* are hard to beat!

In conclusion, I propose to give \$100, for two one-year old plants of a better variety than the *Isabella* or *Catawba*, to be tested by three competent judges in Rochester, or elsewhere, upon examination of specimens of fruit, to be presented, say on the first of October, and also on the first of April. North East, Pa., April, 1859. WM. GRIFITH.

FRUIT FOR CERTAIN LOCALITIES.

FRIEND MOORE:—I noticed a communication from J. S. C. in the *RURAL* of April 23d, on "Fruit for Certain Localities," and thinking I might add a thought or two on this subject, which seems to me one of great interest to fruit-growers, I have begun this letter. It is a principle (or fact) two little understood, that many fruit trees, shrubs and vines, which "do well" in one locality, will not answer for another locality, perhaps of the same latitude. I have known a number of persons in this vicinity to purchase from the agents of *Eastern Nurseries*, apple trees for orchards, and although the trees seemed to be vigorous, healthy, and in good condition, now, (two years after,) there are not five per cent. of said trees in the "land of the living." The *Isabella* and *Catawba* grapes, we read, "do well" in our own latitude in the East, yet our friends of Northern Iowa will doubtless agree with me that they invariably winter-kill here, unless buried in earth during winter. We have a grape, the *Alexander*, perfectly hardy, a good bearer and excellent fruit. The *Concord* grape also appears to be hardy.

There has been a lamentation going about here, as I doubt not there has been in other new countries before, that fruit will never grow here. Ten years will show such a sentiment to be very false. I have visited a number of Nurseries in Northern Iowa, and one thing has invariably attracted my attention. There would be a number of rows of trees (apple) side by side, sickly, half dead or dead altogether, while on either side perhaps a number of rows of healthy, vigorous trees. I inquired "Why is it?" Were they not planted at the same time and treated in the same manner? They were precisely, but the healthy, fine trees are hardy here, and the sickly trees are tender and not fit for this vicinity.

Each locality has its own peculiar soil and climate, and must have fruit trees, vines, &c., which will thrive with such elements. And why need this be so little understood. Iowa has her large, Western corn, and spring wheat, and New York has eight-rowed Yankee corn, and winter wheat. The beech, chestnut and magnolia trees that grow so luxuriantly in Northern Ohio are not found here. But I will leave this subject to abler pens.

PHINEAS ALLESTY.

Hopkintop, Del. Co., Iowa, April, 1859.

LIME FOR THE CURCULIO AND BLACK WART.—J. W. HILL, of Gardner, Mass., says in the *N. E. Farmer*, that himself and some half dozen neighbors have for the last three years scattered air-slaked lime over their plum trees, from the time the blossom leaf begins to fall until the curculio has done working, usually about four weeks. Their trees are "all in a healthy state, and loaded with good, smooth fruit, and the trees entirely free from the black wart," though trees left to themselves are badly affected with it. They use lime freely, as often as the dew or rain takes it off—applying it with a sort of pepper-box affixed to a pole. If this proves generally effective it will be a great blessing to lovers of fruit.

MELONS.

As the season is approaching for all lovers of good fruits and vegetables to commence planting, I thought a little information in the line of melon-growing would not come amiss. In order to have good melons it is necessary to spend a little time in preparing the soil and guarding them against the many dangers that beset them. The first thing to be considered is the soil. Warm, sandy loam is the best soil to plant in, in order to be sure of a good yield. The ground should be plowed about ten inches deep eight or ten days before planting. The hills should be prepared in the following manner:—Dig holes eight feet apart each way in a straight line, that they may afterwards be cultivated with a horse. The holes should be dug twelve inches deep and sixteen inches square. Let the holes become perfectly dry on the inside, then fill each hole to within about one inch of the top with fresh horse manure, and cover it with about one-half an inch of rich, sandy earth, then your ground will be ready for the seed. The time of planting depends much upon the season. They should generally be planted after corn planting.—As soon as the plants are up a little plaster should be sprinkled upon the leaves to prevent the ravages of the striped bug, and should be repeated as often as is necessary. The plaster is not a remedy, but a preventive. When the plants begin to show the third leaf they should be watered two or three times a day with a liquid manure, which may be prepared in the following manner:—Take one peck of hen manure and put it in a small barrel and add about three times as much water, and let it stand about twelve hours. When the weeds begin to show themselves above ground take a horse and cultivator and cultivate the ground all over between the hills, and weed between the plants. The weeds should be kept down, and the ground kept mellow between the hills. All the work should be done in the hottest part of the day, for it is very injurious to the plants to work among them when they are wet and cool. After you have followed all these directions, all will be done to your melons but to watch them from robbers and eating them.

DAVID W. HERMAN.
Fairville, Wayne Co., N. Y., May, 1859.

REMARKS.—We like these directions—all but the slight covering to the manure. Was the manure thoroughly rotted it might answer, but half an inch is not sufficient covering for such a bed of fresh, hot, horse manure. We think our correspondent must have made some mistake on this point.

THE APPLE BARK LOUSE.—From several friends, mostly at the West, we have received pieces of apple bark, completely covered with the *Apple Bark Louse*, with inquiries for a remedy. The scales are relics of the bodies of female insects, covering and protecting their eggs. The eggs are so minute that these small scales sometimes cover more than a hundred. The time of hatching is from the middle of May until the first of June. We will give two of the best remedies known. 1st. Prune early in the spring. Mix tar and linseed oil together, and apply warm with a paint brush to every limb. This, when dry, cracks and peels off, bringing away the scales and eggs with it. Trees thus treated will show the benefit received by a vigorous growth. 2d. Boil leaf tobacco in a strong lye until it is reduced to an impalpable pulp; mix this with soft soap (which has been made cold, and not the jelly-like boiled soap) to make the mass about the consistency of this paint. Prune the trees and apply this preparation with a brush, to every limb and twig. This will take time, but the remedy is effectual. A gentleman in the Western part of this State wrote us last season that he had entirely rid his orchard of this pest, by simply throwing unleached ashes over the branches and trunk when wet. Care must be used that the ashes do not touch the leaves. The best time for this operation would be early in the spring, before the buds push.

MANURING AN ORCHARD WITH CLOVER.—Having set out a large orchard, and as it is rather difficult to manure it with stable manure, I wish to know the propriety of sowing Clover and Timothy—to let it rot, not taking any grass off, but mowing the trees with it, and let it all rot on the ground every year? I have never seen anything on this system of treating an orchard. Should be pleased to see it in your valuable paper.—YOUNG FARMER, Prospect Farm, Danville, N. Y., March, 1859.

We once recommended the sowing of clover in a peach orchard, for manure, and watched the result. The soil was very sandy, and poor, and the trees were evidently suffering for nourishment. It was sown very early in the spring, thick, and made a good growth. We concluded that the trees were injured by the clover the first summer, but the next, just before coming into flower, it was plowed under, and the effect was very marked and beneficial for two or three years afterwards.

APPLE TREE WORMS.

Eds. *RURAL*:—It is just in time to say to farmers, "clear your orchards of these loathsome worms." But, says one,—"My neighbors have orchards well covered with this pest, and it is useless for me to fight single handed against so great an enemy."

The subscriber has neighbors, also, and they have orchards; and some of these orchards have plenty of worms. This spring I have counted 30 in a tree. They are from 30 to 50 rods from mine. I have just been through my orchard of 300 trees, and found but three nests in all. My trees are from five to nine inches in diameter—large, open, spreading tops.

Now, would you know the "modus operandi" of exterminating the vermin? I will tell you how I do it. I take the little colonies when they first appear, with my fingers, from the crotches, where they generally commence their webs. With one wipe I take the entire family, house and all, and crush them under my boot. As to the myriads in my neighbors' orchards, I have learned they are not so much to be feared. If you will not allow them to mature on your own premises, you will find the seed very scarce another year.

If you can't touch "the nasty things" with your fingers, I presume you can invent some other plan to bring them down. As I know of no better, I will not trouble you by suggesting one. Bun.
Macedon Centre, N. Y., 1859.

TOP ONIONS, &c.—Which will cost most for seed, the top onions or the seed, and which is safest? What will be the cost of each, sufficient to seed an acre? Also, which yield best, white, yellow, or red onions? Will they grow to good advantage on green sward? Would it be best to have the green sward broken up the fall before, or the spring they are to be sown? Is sheep manure a good fertilizer?—W. H. S., Eddytown, N. Y.

TOP ONIONS are only grown, as far as we have known, in gardens, for summer use. Four pounds of Onion seed we generally sow to an acre, costing from \$1 to \$1.50 per pound. Top Onions sell for \$3 per bushel, and it would take nearly 14 bushels to plant an acre four inches apart in the rows, and the rows one foot apart. The White Onion is prized for garden culture, but is not generally grown by farmers. There is little difference as to yield between the red and yellow. We would plant Onions only on a well-prepared, clean soil. The labor of keeping an acre of Onions clean on a turf would be intolerable. Sheep and hen manure are excellent for onions. If common stable manure is used, it should be thoroughly decomposed.

A CURIOSITY.—We were shown yesterday afternoon, by Mr. B. F. Sloan, what we consider quite a curiosity, though others have seen the same things heretofore. It is a rose grafted on the peach tree. The tree is now in full bloom, and must present a beautiful appearance.—Pendleton Messenger.

HYBRID GRAPES—(T. W., London, C. W.)—It is by no means certain that a hybrid grape has ever been produced. Many of the most scientific pomologists consider the change from the parent as only a sport.

COMPOSITION CAKE, PORK CAKE, &c.

Messrs. Editors:—Seeing by your paper that good recipes will be favorably received, I send a few which we think are really excellent:

MOLASSES FRUIT CAKE.—One cup of butter; one cup of sugar; 1 cup of molasses; 1 cup of sweet milk; 8 eggs; 1 teaspoonful of soda; 2 of cream tartar; 1 of cinnamon; 2 of cloves; 1 nutmeg; 8 cups of flour; 1 pound of fruit.

PORK CAKE.—One pound of pork (fat and salt) chopped very fine; 1 pint of boiling water poured on the pork; 1 cup molasses; 2 of sugar; 1 tablespoonful of saleratus; 1 of cloves; 1 of cinnamon; 5 cups of flour; 1 pound of raisins. This makes a very good fruit cake, especially if butter and eggs are scarce.

COMPOSITION CAKE.—One and one-third teaspoons of butter; 1½ teaspoons of cream; 8 cups of sugar; 7 eggs; a teaspoonful of saleratus; 1 cup of raisins. Stir as thick as cup cake. M. H. S.
East Bloomfield, N. Y., 1859.

BEER AND VINEGAR.—A while since my wife made some beer by the following process:—Shelled some corn and boiled in clear water until slippery, (say half an hour,) then took it out of the water and put into a keg of clean, cold water. To this we added about 1 quart of molasses to 5 gallons of water; left it in a warm place about 80 hours when it was very palatable. But the best of the story is to come. After two or three days it soured, and by putting some of it in a jug by the stove, in just one week's time we had good vinegar. This I believe is the cheapest and quickest made I have ever known. Thinking this may prove of value to others I have narrated it for the thousands of *Ruralists*.—G. D. B., Rochester, Mo., 1859.

HARD SOAP.—An Inquiry.—If any of your numerous readers have a good recipe for making hard soap, I wish they would send it to the *RURAL* for publication, and thus oblige very many householders who desire to make their own soap.—RURAL READER, Onondaga Co., N. Y., 1859.

GRAHAM BREAD.—Take a pint of warm water; half a teaspoon of coffee sugar; one-fourth teaspoon of soda; mix soft with unbolted flour made of good winter wheat, cut in small cakes, bake quick.—H. B. D., Orangeville, N. Y., 1859.

PUTTY that has become hardened may be rendered soft, so as to be easily removed, by the application of a hot iron to it. In this way it may be readily removed, where glass is broken, without injury to the sash.

THE MESSENGER.

LAST NIGHT there came a messenger,
A Traveler from an unseen land,
He smiled upon our Babe fair—
Then round his soft and yellow hair,
We thought we saw a radiant band
Of glory shining there.

We folded the white hands on his breast,
We closed the eyes so dark and bright;
While gazing on his peaceful rest
Shone the star-sentinel of night.
We watched the shadows 'till they fled
In terror from the eye of day,
Ah! thus to thee, sweet child, we said,
Have care of earth now passed away.

Paris, Mich., 1890. Mrs. J. W. S.

THE BABY.

Another little wave
Upon the sea of life;
Another soul to save,
Amid its toll and strife.

Two more little feet
To walk the dusty road;
To choose where two paths meet,
The narrow, or the broad.

Two more little hands
To work for good or ill;
Two more little eyes;
Another little will.

Another heart to love,
Receiving love again;
And so the baby came,
A thing of joy and pain.

Plain Talks to American Women.—No. 10.

BY MRS. N. P. A. CROZIER.

VENERATION FOR GOD.—The child comes into the world ignorant of the being of a God. Soon, in Christian countries, it learns of His existence, and begins to gather some dimly-conceived of personality, various attributes, and to entertain towards Him feelings of love, or of hatred—of trust, or of fear. How important, then, that the impressions made upon its mind relative to the "High and Lofly one that inhabiteth Eternity," be just impressions, such as will cause its young affections to go out towards Him as an All-Wise, All-Holy, All-Powerful, and All-Loving Father! We counsel no precocious unfolding of the spiritual nature, this is unnecessary; but as the intellect and heart, in natural and healthful development, reach forth after the Unseen, let the feeling become full and settled that the *ultima* *thule* of all perfection, that the great focal point of all the glory of the Universe, is God.

Perhaps the first idea of God which should be taught the child, is that He is the Creator of all things—and the second, that He is *Love*. This order is natural, and easy. Who made this?—how came it to be?—are early inquiries of childhood, and when it learns that the ultimate cause of all things is God, and looks abroad upon nature, and beholds the beauty and fitness, so far as it is able to comprehend, of its various parts, it will be easy for it to be led to feel that no one but a being full of love could have formed and arranged it. Impressions of other divine attributes, such as wisdom, and omnipotence, will readily follow.

Few of us realize as we should, and as our capacities if properly cultivated would enable us to do, these infinite attributes of Jehovah. We are not sufficiently accustomed to trace in His works the evidences of their existence. Very low and unworthy are our ideas of Him "who hath stretched out the heavens as a curtain, and before whom the inhabitants of the earth are as grasshoppers," to whom "the nations are as the small dust of the balance," "who hath measured the waters in the hollow of his hand," and "taketh up the isles as a very little thing." If mothers, to whom is given the pleasant work of imprinting upon the soft heart of infancy, its first impressions of a God, would often revolve in their own minds the evidences of His infinite perfection, a deeper love would be kindled in their own bosoms—a loftier faith would burn upon the altars of their hearts—and we might look for the glow of the love and of the faith to radiate into the souls of the precious ones committed to their care, lighting them up with a glory akin to the brightness of Heaven. Such meditations are eminently elevating in their tendency. Combined with reflections upon the divine plan of salvation, they cause the Christian soul to flow forth towards the Great Fountain of light and love, in lively emotions of gratitude and praise. A deep appreciation of the works, the attributes, and the truths of God, will lead the mother earnestly to desire, and fervently to pray that the spirits of her own cherished offspring may be tuned in harmony with the grand orchestra of the Universe, to the praise of Him to whom at some future time shall be given from "every creature which is in heaven and on the earth, and under the earth, and such as are in the sea," this noble ascription:—"Blessing, and honor, and glory, and power, be unto Him that sitteth upon the throne, and unto the Lamb forever and ever." It will also lead her to inquire by what means this may most effectually be secured. It may not be too much to say that it will be by a similar process to that which has led her own mind to take delight in the deep things of God.

An elegant writer, (George Gervillan,) remarks of the sentiment, "God is Love." "Why is not this sentence sown in our gardens of living green—framed and hung in our nurseries—taught as the first sounds to little ones? Why not call God Love? Why not change the name of our Deity? Why not instruct children to answer, when asked who made you? Love, the Father. Who redeems you? Love, the Son. Who sanctifies you? Love, the Holy Ghost." Without admitting the propriety of

the selection of this particular attribute as a representation of "Our Father," to the exclusion of others, and of His personality, we would still have our children's hearts deeply imbued with the idea that God is Love. We would have our nurseries abound in illustrations of this glowing truth, and we would have our darlings feel that it is "sown in our gardens of living green," that it is written upon every pebble in our pathway, that it twinkles in every star that blazes upon the coronet of heaven, and that in brightest, deepest lines, it is engraven upon the cross of Christ.

Mother, take the soft, dimpled hand of that dear child in your own and lead it out among the roses and the violets—show the little one how from tiny seeds imbedded in the earth, has upsprung all the loveliness which it beholds. Take in your hand a flower, exhibit its beauty and delicacy as visible to the naked eye, then under the microscope reveal its still more wonderful beauty and delicacy.—Compare this work of God with some exquisite work of art, and show how, in the comparison, the latter becomes coarse and imperfect. Show him how well adapted is the beauty of the blossom to please the eye, how grateful to the sense of smell is its fragrance—how the prevalent emerald of Nature's summer robe is suited to the organ of vision, being just the soft tint most agreeable to its nature—bid the thoughts of the child go forth over the wide world, and recognize in the abundance and variety of bloom and verdure, the infinite wisdom, and the goodness of the Almighty, and say, when he again kneels at your side with clasped hands and upturned eyes for his evening prayer, will he not feel that the Father of whom he asks a blessing, is indeed a God of Love.

Take him at night out beneath the bending heavens, softly radiant with the light of a thousand gems; explain to him that these are all worlds, called into existence from nothing, by the will of the great I AM; that they all have their appointed orbits, from which if any one should greatly deviate, it might cause a universal "wreck of matter, and crush of worlds"—take him upon your knee and unfold to him some of the wonders of his own body, the breathing of his lungs, the beating of his heart, the circulation of his blood—show to him that if any of these operations should by any cause be arrested life would become extinct; that causes sufficient to this exist all around him, at all times, and, after all these illustrations, will he not feel, and feel deeply, that he is dependent upon a God of Love for every moment of existence?

Tell him the sad story of man's failure in Eden—of its fearful consequences, sin and death—how through the thick darkness that fell upon the world when man first did wrong, no light, no ray of hope penetrated, till God sent a beam of glory from the fountain of his own goodness, and lo! there broke upon the earth a brightness that only culminated in the death and resurrection of His Son. Teach him that "God so loved the world that he" thus rescued it from eternal gloom—that it was Jesus' love that led Him to become the "man of sorrows," to give himself a sacrifice for sin, to become the Redeemer of sinners, and will not the heart of childhood beat with deeper, fuller throbs of sorrow for sin, throbs of pity for the Savior, and throbs of love for "Our Father" and our "Elder Brother?" And will not a holy faith bud there, a faith that shall blossom into a glorious maturity, and bear fruit for the future Paradise of God? O, mother, do you realize your mission?

In similar ways may you impress upon the minds of your children a sense of the power, the wisdom, and the justice of God, and thus, step by step, lead them on in the delightful paths of the truest wisdom. And how in after years, when your own dust shall be reposing in the wasting tomb, may the remembrance of the precious instruction you have given, come home each day freshly to their hearts, and bring fresh tears to their eyes, which they would fain shed as the evening dew upon the flowers that bloom upon your grave, or with which they would embalm every relic of a mother's love. How worn may be the spot where their knees shall press the sod above you—how tender will be their hearts when they remember that the God to whom they pray is the God of a sleeping mother! And how will they long for the immortal rising! Yes, softly, like the echoes of a music that has floated away, will come home to their souls the vibrations a mother's harp of love, touched by the soft breath of holy Christian Faith!

A FACT FOR LADIES.

A WRITER on fashion says that flounces, by marking the height at regular intervals, take away from it and make a short figure look shorter. For this reason, short persons should not wear strips running in parallel rings round the dress. Perpendicular stripes upon a dress make the wearer look taller, like the flutes in a composite. It is too much the custom of all who would be considered fashionable, to imitate the prevailing mode, regardless of its suitability to face or form. When flounces and hoops, as now, are worn, short, dumpy ladies flounce up to their ears, and extend their diameter infinitely beyond their perpendicular measure, which gives them a ludicrous appearance enough, somewhat similar to a Dutch built brig, under full press of canvas.

There is nothing moves a gentleman's admiration for a lady so quickly as that she has adapted her dress to her stature and figure. In choosing colors, great care should be taken—a gaudy show creates disgust, and even it were better they should be plainer than the dresser likes, than they should run to the other extreme. No one ever lost by simplicity. Simplicity of manners and simplicity of dress are the greatest charms in the world. And let it be remembered, let there always be a sympathy between yourselves and your dress. The rose would appear less beautiful with the tint of the violet, and yet both are beautiful.

VANITY IN DRESS.—Some young ladies, feeling themselves aggrieved by the severity with which their friends animadverted on their gay plumes, crinolines, scarlet petticoats, and flounces, went to their pastor to learn his opinion. "Do you think," said they, "that there can be any impropriety in our wearing these things?" "By no means," was the prompt reply. "When the heart is full of ridiculous notions, it is perfectly proper to hang out the sign."

HAVE FAITH AND STRUGGLE ON.

BY L. E. S. ANDERSON.

A SWALLOW, in the spring,
Came to our granary, and 'neath the eaves
Essayed to make a nest, and there did bring
Wet earth, and straw, and leaves.

Day after day she toiled
With patient art, but ere her work was crowned,
Some sad mishap the tiny fabric spoiled,
And dashed it to the ground.

She found the rain wrought;
Yet not cast down, forth from her place she flew,
And with her mate, fresh earth and grasses brought,
And built her nest anew.

But scarcely had she placed
The last soft feather on its ample floor,
When wicked hand, or chance, again laid waste
And wrought the ruin o'er.

But still her heart she kept,
And toiled again; and last night, hearing calls,
I looked, and lo! three little swallows slept
Within the earth-made walls.

What truth is here, O man!
Hath hope been smitten in its early dawn?
Have clouds o'ercast thy purpose, trust or plan?
HAVE FAITH AND STRUGGLE ON.

CHOICE MISCELLANY.

PLOWHANDLE PAPERS.

MR. PLOWHANDLE CLOSURE UP THE GAPS.

KANTAIL COTTAGE, Feb. 1st, 1890.

COL. MOORE.—Dear Sir:—I felt so kinder rung out when I wrote my last letter, that I thought I should never get pluck enough to write to you again. But since I got the bound volume of the RURAL for last year, I have been reading it over, especially my letters, and I find there are some gaps in the account of our folks that ought to be closed up. Between ourselves, Col., I feel pretty grand to see my letters bound up in a book like the RURAL. It looks considerable like going down to posterity, and being read, and talked about when you are dead, like WEBSTER and Gen. JACKSON, and other poets.

SPECULATIVE.

Don't you think it would be a good plan to get all my letters into a book by themselves, and put my picture on the front, and your'n and mother's along between the leaves. I think the book would sell well, especially if you would make a perforce in the beginning on't. I do believe I could sell more nor a dozen copies down at the corners next training. If you're minded to go into it, and will get it up nice on your own account, I will go halves with you on the profits, and you might go a long ways over a good road before you'd find another man that would make the same offer.

MATRIMONIAL.

But I'm takin my pen in hand now mostly to let you know what became of SAM and SUSAN's affairs. You see, Sam got his girl in spite of us; 'tho' when I thought about getting into office I didn't make much opposition, for I knew SARAH had been where they knew how to get out their best mahogany as naturally as we do our best cherry; and as mother and I might go to the Assembly, it would be a good plan to know how to put our feet under it kinder scrumptiously. Of course I was dreadful glad when Bos won SUSAN. We all concluded to have the weddings Monday after New Year's day, so as to have both the girls make their wedding party at the same time, and we'd have a grand smash-up of it all at once.—Mother and SUSAN were for having a kinder patent leather affair of it, and only ask in a few of their fine acquaintances; but I and SAM didn't like it at all, and SAM didn't like it any better than we did, for he wanted the second day wedding at his house, when he was going to bring home the widdier; for, you see, just as soon as he got elected, she came right down and agreed to have him on sight.

We'd been talking about it at tea, and when the women lit the candles, SAM, and I, and Bos, were all together in the setting-room, and Mother, and SUSAN, and SARAH, and I thought I'd just jump right in and paddle out the best way I could; so says I to SAM, says I, "SAM, have you seen Ick about coming with his fiddle?"

You ought to have seen Mother how quick she took off her spectacles, and laid down her stitching, and looking up, says she—and there was a little grit in it—says she:

"What did you say, John?"
But I pretended not to hear her, and kept looking right straight at SAM.

A SQUALL.

SAM went on just as though nobody had spoken but me—says he, "I saw Ick, and he says four of 'em will come."

You see the cloud burst right on my devoted head. The girls leaped back in their chairs.—Mother got up and came towards me, and Bos and SAM sorter shied. But, thinks I, who's afeard; so I straightened up to my tallest inches; so she came right up to me, and laid her hand on my shoulder, and says she, pretty sharp,

"Are you going to have fiddling and dancing in this house to-morrow night, John?"
Says I, "You never said a truer thing in your life."

"Well, it's too bad. But it can't be done."

"Perhaps not."

"We've no place to dance—no place for the music—besides, what will people say?"

"Well, let us see. There's the front room, that will hold a good floor, and the big bed-room, that will hold a good French four."

"But the carpets will be spoiled, and the bed is in the way."

"We can take up the carpets," said the girls.

"Then there will be the bed."

"Well, we can take it down in five minutes," says SAM.

And the music can stand in the front entry," says I.

"Oh dear! how dreadfully the house will look without the carpets."

CALM COMING.

I thought the wind was going down somewhat, so, thinks I, perhaps I may come the sweetnin' a little. So I just kinder slightly slipped my arm around her waist, and says I:—"My good little wife, I want to dance at our SUSAN's wedding just as I danced at yours 30 years ago."

"Not thirty, JOHN, only twenty-nine. But you are old and grey-headed now."

"Well, if my head is grey, my heels ain't, no how," and I just come one of my old-fashioned breakdown double-shuffles, and a pigeon-wing at the end on't, and balanced up to her. "There," says I, "did you see any grey hairs in that?" And I took her in my arms, and gave her a smacking kiss. "Well, says she, there ain't any in that any way." "Besides," says I, "you used to love dancing before we were married, as much as anybody, and I used to think sometimes you danced with the other fellows just to show me what a pretty figure you made on the floor."

"Oh, JOHN!" says she, and putting her arm around my neck she gave me one of the sugarest kisses I ever had.

You see, Col., I won that time on the honey principle, and I do think, after all, that sweetnin' is a blessed institution in a family, and perhaps it wouldn't be bad in a small town like yours.

Everybody sposed they'd be married in church on Sunday, and the house was fuller than I'd seen it before since DEACON GOODENOUGH's funeral. But they got a good sermon for nothing, and that's all they did get anyhow. The young people wan't married till the next day; and then we had one of mother's grandest kind of dinners, rice pudding and nutcakes, and custard, just as much as we could eat. Well, it's no use of talking about the good things one eats, 'cause if you do you are sure to be wanting to eat them again when you can't.

THE DANCE.

The very capeshead of glory was the dance in the evening. 'Tho', to be sure, I did feel kinder bad to see SUSAN get married, and know that she was going to love another man better than her father. She'd always been a good, kind girl, and the thousand and one little things that she would contrive to do to make me feel how pleasant home was, made it seem kinder hard to part with her. But then as I had served another man pretty much the same trick I didn't think I ought to worry much about it; besides, mother was left.

It wan't long after the candles were lighted before the young people began to come in, and pretty soon there was a heap of them. SMITH wanted me to open the dance with the widdier, and he'd take mother, and the boys and girls all set in, and they wouldn't take no for an answer; so, I had to lead off. After all, I felt sorter of queerish, for I hadn't danced in a great while, and I feared I might go wrong. But I knowed the widdier was up to snuff in these kind of things, and would bring me out anyway.

"What'll you dance, Mr. PLOWHANDLE?" says Ick.

"Money Musk," says I. "Ready," says Ick, and off we started.

Perhaps, Col., you've never danced Money Musk? If you haven't, you don't know what good dancing is, that's all. There's no other figure that I ever heard on that begins to have the real old-fashioned dancing in that this has, nor one that you can show off in, if you've got the steps, like it. I've sometimes thought it was a good deal like the world generally, for you dance with your partner some, but you balance to other people's partners more.

Well, the weddings are over, and I go about my chores just as usual; but the remembrance of the good time I had is a kind of green spot of pinks and violets on a dry knoll.

I don't think I shall ever have any thing more to write about, Col., though SMITH writes to me that he'd want me to help him lobby or he won't get the law for the bridge over the Toe-muddy. If I go perhaps I'll write to you again.

Yours, to command,

JOHN PLOWHANDLE.

"ROUGH, BUT HONEST."

PERHAPS SO. Such persons have existed, beyond question. The fallacy lies in the implication that roughness and honesty are naturally twinned; the truth being quite as often that they are not in the least related. Good manners and good morals are oftener found in company than rudeness and goodness. Genuine kindness of heart rarely fails to produce gentle words and a benignant countenance. Coarse manners are either the result of a coarse nature, or are assumed on the strength of the "rough-but-honest" proverb, to get credit with shallow observers for a sincerity that does not exist. Shakespeare, who knew a thing or two about human nature, was not deceived by pretenses of this sort. Observe his portrait of one of these humbugs:

—"This is some fellow

Who, having been praised for bluntness, doth affect
A saucy roughness, and constrains the garb
Quite from the nature; he cannot flatter, he—
An honest mind and plain;—he must speak truth;
These kind of knaves I know, which in this plainness
Harbor more craft and more corrupted ends
Than twenty slyly clucking observants
That stretch their duties nicely."

Human nature has not greatly changed since the time of the great poet. The old tricks are all in vogue, and make, perhaps, as many dupes as ever. Your genuine "blunt-and-honest" fellow is at least tolerable; but the imitator is the most disagreeable of all the impostors extant. Luckily, he is sure to show his real character at a pretty early day, and is branded thenceforth "rough and rascally."—*Doston Post*.

Carries are a kind of freebooters in the republic of letters—who, like deer, goats, and divers other gaminivorous animals, gain subsistence by gorging upon buds and leaves of the young shrubs of the forest, thereby robbing them of their verdure, and retarding their progress to maturity.—*Washington Irving*.

SABBATH MUSINGS.

Written for Moore's Rural New-Yorker.

THE EVENING AND THE MORNING.

I TURNED to the dial of life to mark
How the moments fled away,
And the silent hand had pointed down
To the closing hour of day.

The sun, which lingered among the clouds,
Looked out with a golden gleam,
And its light flowed over the fading past
Like the music of a dream.

Then the night came on—the long, long night—
With its heavy weight of woe,
Behind were the flowers of former hours,
And before was the falling snow.

In the dead mid-watch a spirit of light
Passed through the shadowy dome,
The stars looked down and beckoned me,
And I felt that I was going home.

When the morning broke—the glorious morn—
It shone on eternal day,
That spirit of light still led me on,
And the world had passed away!

Ogdensburg, N. Y., 1890. E. O. J.

Written for Moore's Rural New-Yorker.

THE FUNERAL.

THERE is something in the passing of a funeral procession which appeals to the heart with wonderful power. A soul has departed from among the living, and we are now rendering the last tribute we can ever give. First comes the slowly moving hearse, shrouded in black, symbolical of the darkness within. Closely following are weeping friends, attending to its lasting place, that loved form which, a short time ago, was animate with life and health, and spoke loving words, but now, cold and silent in the embrace of Death.—Then come friends and neighbors, to pay their last respects to the departed, and witness his consignment to the narrow tomb. It is wonderfully touching. That mortal will never walk this beautiful earth again. He has had but one short life to live and that is done. Now he has put on immortality. The realities of eternity he now knows, while we have them yet to learn. Thou following train, he goes before thee to the everlasting habitations, and unto thee also is the decree, "Dust thou art, and unto dust shalt thou return." JANE E. H. Piffard, N. Y., 1890.

TEMPTATION UNIVERSAL.—In no scene of earth, in no condition, are we exempt from the incursions of temptation. If we flee to the desert, and brook not the sight of our fellow-creature's face, we bear thither the fiend within; we cannot build out or bar out the indwelling evil spirit. The gratings of the monastery cannot exclude the wings of the fallen seraph, nor solitude sanctify the unregenerate heart. In the garden or the grove, the palace or the hermitage, the crowded city or the howling wilderness, sin tracks us, and self haunts us. If the poor is tempted to envy and dishonesty, the rich, as Agur testified, is equally endangered by pride and luxury. If the man with ten talents is puffed up with self-confidence, and arrogant impiety, the man of one talent is prone to bury slothfully the portion intrusted to him in the earth, and then to quarrel with its Holy Giver.

The great adversary has in every scene his snares, and varies his bait for every variety of condition and character. Each man and child of us has his easily besetting sin. The rash and the cautious, the young and the old, the rude and the educated, the visitant of the sanctuary, and the open neglecter of it, the profane and the devout, the lover of solitude and the lover of society, all have their snares.

TRIUMPH OVER EVIL.—We are rewarded for every triumph we make over temptation. I will suppose there are many who have struggled against the vanity of vain pleasures; many who have put down evil thoughts with a strong will; many who, after a long, and it may be an uncertain conflict with the seductions of the world, have at length triumphed. I will put it to them whether, when they have combatted and so prevailed against the evil, and their hearts have not softened and melted within them, whether they have felt within their bosoms a seraphic influence? No sooner shall they have driven from them the demon of pride, of vanity, of anger—no sooner shall the devil have left them, than angels will come and minister unto them.—*Terrill*.

THE BIBLE.—Out of it have come all the pure moralities. Forth from it have sprung all sweet charities. It has been the motive power of regeneration and reformation to millions of men. It has comforted the humble, consoled the mourning, sustained the suffering, and given trust and triumph to the dying. The wise old man has fallen asleep with it folded upon his breast. The simple cottager has used it for a dying pillow; and even the innocent child has breathed his last happy sigh with his fingers between its promise-freighted leaves.—*Timothy Tylcomb*.

CHRISTIAN TRAVELER.—Each true Christian is a night traveler; his life, his walk—Christ his way—and Heaven his home. His walk painful, his way perfect, his home pleasing. I will not loiter, lest I come short of home; I will not wander, lest I come wide of home, but be content to travel hard and be sure I walk right, so shall my safe way find its end at home, and my painful walk my home welcome.—*Author Warwick*.

DAILY BREAD.—That bread which nourisheth to eternal life. He who has lost his appetite, is certainly sick; so is the soul that desireth not the good which cometh from God. We receive grace in the same degree as we desire it.—*Selected*.

EDUCATIONAL

SCHOOL GOVERNMENT.

One great hindrance to successful teaching is the want of a proper faculty to govern, yet, by careful study of the nature and disposition of children, and a determination to succeed, this may be acquired to a certain extent. It is a fact to be regretted that many of our instructors teach only from a love of gain, and, of course, take the easiest way of acquiring their object, with but little regard to the performance of duty, or the right formation of the moral and intellectual character of their pupils. Such is the force of first impressions upon the youthful mind, and so strong the determination not to forget that their good intentions have been disregarded, that the first day of school decides how successful the teacher shall be in the management of his scholars.

This reasoning may seem incorrect, but let us take an instance. Let the first work of the teacher be that of posting a long list of rules in a conspicuous place, and as soon as the scholars have entered the school-room, let them be read with a you'll-mind-me sort of an air—as if nothing was expected but open rebellion—and in the meantime let particular care be taken to call their attention to the bundle of rods the master has not forgotten to place in the corner. What is the result? The scholars conclude at once that they are to deal with an enemy, and will not conform to the rules of the school unless to escape punishment—their chief aim being to thwart the plans of the teacher. But little advancement is made in study—the time is wasted without uselessly spent, because habits are formed which require a great deal of correction to overcome. Yet this called *teaching school*, from the fact that people suppose *keeping and teaching school* are synonymous terms.

There are instances when corporal punishment must be resorted to—prompt obedience must be given—yet do not lose your influence over a child by continued threats. Let every rule be well considered, and the necessity for making it, before it is given to the school—avoid making rules as much as possible. If the scholars are interested in study they will discipline themselves, and to the attainment of this end the teacher should leave no means untried. By never speaking in a harsh or unkind manner—always having perfect self-control—never saying things hastily—of which you will have cause to regret—in short, “let patience be her perfect work,” and you will teach your scholars *submission by example*, which is better than precept.

If disposed to condemn the conduct of a child, look at the motive, not the deed. We know not how hard the battle before wrong overcome right—shall we then blot out every pure impulse from the mind of the child by hasty chastisement, or by good counsel and words of encouragement make an impression which shall be lasting, and thereby reclaim the erring one? EMILY ELLIS.

Written for Moore's Rural New-Yorker.
STUDY-BOOKS.

Are books the only source from which we can obtain knowledge? or, are there other means by which the mind may be educated? We are sure that these questions open a field of thought in which we may take long and pleasant rambles. In our younger school-boy days, we used to think that when the much-wished-for vacation came, we were through with our studies; but little did we think as we chased through the fields and over the hills with gleeful shouts, that we were under the instruction of Nature's silent teachings—that the sun, moon and stars, the rain and dew, taught their “sublime lessons,” and that the grassy carpet beneath our feet, the flowers, trees and stones were full of instruction. Thus we find

“Books in the running brooks,” and in everything around us volumes of thought, which, if we take the pains to peruse, will instruct us, and we will be better able to understand the handiwork of Nature.

The knowledge which is derived from books appears to be *mechanical* and *insipid*; while that derived from the beautiful mysteries of Nature which surround us, and which we draw in with the very air we breathe, is something *real*. We must study books to fit ourselves for the every-day transactions in business, and even when we are sufficiently skilled in this branch to perform our work with alacrity and correctness, our education is not yet complete. *We are being educated all the time.*—Whether holding the plow or leveling the forest tree—in the gay circle or the workshop, the process is still in operation. Men have lived and died during past centuries who had not the opportunity of getting their education from books. But were they not educated? Did they not let the mind go out in search of the beauties of Nature? And so they lived—under the instruction of a great and good teacher—now they live, in name, on the brightest pages of history.

“Though the palm be callous, holding fast the plow,
The round cheek is ruddy, and the open brow
Has no lines or furrows wrought by evil hours,
For the heart keeps wholesome, trained in Nature's bowers.”
Hartford, Wis., 1859.

DRAWN

TEACHING ON A LARGE SCALE.—At a public meeting in 1855, Dr. Tyng narrated the following:—“Three years ago, Louis Napoleon, finding that most of the soldiers in his army were unable to read, advertised for a contract to teach them. A single gentleman undertook the task. He asked for no books—nothing but slates and pencils. He brought up the men in a line, and by the use of large letters, at his dictation, they all learned the alphabet, and then to read. He then asked for one single tract. He was permitted to choose, and selected from all the tracts in the language the most beautiful and affecting the Gospel by John, and in less than a year he had taught fifty thousand French soldiers to read the Gospel, and received enough to put one into the hands of each soldier.”

APTNESS OF ILLUSTRATION.

The success of a teacher in his profession depends much less upon the amount of knowledge he possesses, than upon his ability for imparting it to others. Hence we see, not unfrequently, men of great erudition unsuccessful in the profession; and their department (if a specialty in an academy or college) the peculiar dread and horror of all students. Class after class unite with great unanimity in voting such a member of the learned faculty a bore; and hold a jubilee over the hour of emancipation from his authority. And yet, as a man and a scholar, all concur in the opinion that he stands in the foremost rank. The dry and prosy details of a science presented to the minds of pupils in naked general formulae, unillustrated by familiar examples, and unilluminated by special applications, make, at the best, but faint and imperfect impressions. In order to render these general truths valuable to pupils, the ingenuity of the instructor is taxed to the utmost. One illustration which is perfectly understood by one, may be utterly incomprehensible to another; and one reflection from the master mind, which kindles a responsive ray in one intellect, may leave another still in doubt and obscurity. Hence the necessity of varied illustration; and hence, as a consequence, the greater success of the ingenious teacher who is fertile in expedients, awake to his subject, and capable of holding it up to view in all its varied aspects.

We do not advocate the substitution of ingenuity for erudition, or fertility of expedients for profundity of wisdom; we would have the latter, at all events, but we would have it *cum grano salis*. The profoundest blockhead in the world, is the learned blockhead. The successful teacher, in addition to his book learning, must be familiar with common things; must understand and be competent to draw examples from the every-day affairs of life. He ought to be able (but it is not usually the best way) to soar high or dive deep for an illustration. Things palpable and familiar, matters that occur from day to day, and are seen and known by the pupils, are usually much to be preferred. If the latter assert an absurdity, show up the absurdity in a ridiculous light; if he stagger under an obscure or weighty truth, alleviate his barthen by a cognate truth more easily understood. Humble expedients can be resorted to with great success; a knitting needle thrust through a potato represents admirably the axis of a sphere; a thistle down is one of the best possible examples of spherical radii; the scale of a thermometer, or north and south longitudes are excellent illustrations of positive and negative quantities; the leaves of a book at different inclinations make diedral angles; the hopper of a mill is a right quadrangular pyramid; a section of stove pipe a cylinder, &c., &c. All nature and all art teem with illustrations, and the teacher, not too proud to avail himself of homely expedients, nor too indolent to duplicate them for the benefit of the less acute of his pupils, need not despair of leading his charge upon an upward road.

The teacher loses nothing of dignity by the simple illustration of a knotty point; nothing of manhood by being laborious and patient in clearing obstructions from the pathway of a plodding and ungifted student; nothing of self-respect by remembering that what he himself now sees clear as the sun, was once difficult to comprehend; nothing of pre-eminence by reflecting that he stands upon a higher plane, and can see further than the youth below, struggling up the steep.

We, who have taught for a series of years, sometimes forget that we were pupils once ourselves; and, seeing the path so plainly now, wonder that our disciples do not see it also.

The writer was once, during a college vacation, teaching a district school in Massachusetts, and numbered among his pupils a little girl thirteen or fourteen years of age, who possessed a remarkable mind. Ambitious of distinction, and sensitive of reproof, she rarely merited the one, or failed of gaining the other. Not comprehending readily, one day, several illustrations of the old Arithmetical rule of Practice, the writer remarked somewhat abruptly, it may be impatiently:—“It is passing strange you can not see a point so plain.” The poor girl burst into tears of mortified pride, at the implication of dullness, and answered: “I could see it if I was not a fool!” The error on the part of the teacher was repaired as speedily as possible, by telling her that it was not surprising a pupil failed occasionally to grasp a principle; and that teachers sometimes forgot, in the familiarity of repeated application, that they themselves had once met with difficulty on the same points. The poor girl probably soon forgot the circumstance, and with it the momentary pang; but he who inflicted it by an impulse of thoughtless impatience, will carry the recollection of it as a caution while he lives.—She, several years since, went to her rest in the morning of a brilliant and promising life, while her teacher still labors in the profession, striving in a humble way, with “aptness of illustration,” to instill into the minds of the young, some of those scientific truths which render man akin to the immortals.—*New York Teacher.*

LEARN ALL YOU CAN.

Never omit any opportunity to learn all you can. Sir Walter Scott said, even in a stage coach he always found somebody to tell him something he did not know before. Conversation is generally more useful than books for the purpose of knowledge. It is, therefore, a mistake to be morose or silent, when you are among persons whom you think ignorant; for a sociability on your part will draw them out, and they will be able to teach you something, no matter how ordinary their employment. Indeed, some of the most sagacious remarks are made by persons of this description, respecting their particular pursuit.

HUGH MILLER, the famous Scotch Geologist, owes not a little of his fame to the observations, made when he was a journeyman stone-mason and worked in a quarry. Socrates well said that there was one good, which is knowledge, and but one evil, which is ignorance. Every grain of sand helps to make the heap. A gold digger takes the smallest nuggets, and is not fool enough to throw them away because he hopes to find a huge lump sometime. So, in acquiring knowledge, we should never despise an opportunity, however unpromising. If there is a moment's leisure, spend it over a good or instructive thing with the first person you meet.—*Educational Herald.*

ADULTERATIONS OF FOOD.
BREAD.

(Continued from page 153.)

The following list, taken from the results of the labors of Hassall, Marcell, Mitchell, and others, of England, and corroborated by examinations in our own country, will give a condensed history, past and present, of the adulterations of the more common articles of food. Many of the substances used are not only harmless, but even nutritious, but their presence too often involves the addition of still other and more objectionable constituents, for the sake of preserving color, and improving the general appearance of the articles.

Figure 3.
a, Starch granules of Wheat-flour; b, Puccinia Graminis (Sporules); c, Sporules of Uredo Caries; d, Sporules of Uredo Segetum.

f, Flour—Rice, beans; rye, corn, and potato-flour; alum, bone-dust, powdered flint, plaster of Paris.
BREAD—Mashed potato; rice, bean, rye, and corn-flour; chalk, plaster of Paris, pipe-clay, alum, carbonate of ammonia, sulphate of copper, sulphate of zinc.
BREAD—Wheat and potato-flours, tapioca, starch, water, lead, iron, sand, chalk, pipe-clay, plaster of Paris.
COFFEY—Chicory, roasted wheat, rye and potato-flour, roasted beans, mangold-wortzel, acorns, burnt sugar.

COCOA AND CHOCOLATE—Marranta, East India and Tahiti arrow-roots, Tous les Mois; the flour of wheat, corn, sago, potato, and tapioca; sugar, chicory, coco-nuts, Venetian red, red ochre, lard, tallow, mutton-suet.
TEA—Exhausted tea-leaves, leaves of the horse-chestnut, acamora, plum, beech, plane, elm, poplar, willow, alder, locust, and starch, black-lead, gum, indigo, Prussian blue, turmeric, Chinese yellow, China clay, soap-stone, rose pink, Dutch pink, chrome yellow, Venetian red, carbonate and arsenite of copper, chromate and bi-chromate of potash, carbonate of lime and magnesia.

TOBACCO—Water, sugar, molasses, salts, oil, rhubarb, potato, collasfoot, dock, and other leaves, sawdust, carthy matter, sand, nitrate of soda, etc., etc.
VINEGAR—Water, burnt sugar, sulphuric acid.

PORTER AND ALE—Water, sugar, molasses, salt, Coculus Indicus, grains of paradise, capsicum, ginger, quassia, wormwood, calamus-root, caraway and coriander-seeds, orange-powder, liquorice, honey, sulphate of iron, sulphuric acid, cream of tartar, alum, carbonate of potash, oyster-shells, hartshorn-shavings, nux vomica, beans.

GIN—Water, sugar, cayenne, cassia, grains of paradise, sulphuric acid, coriander-seeds, angelica-root, oil of almonds, calamus-root, almond-cake, orris-root, cardamom-seeds, orange-peel.
COLORED CONFECTIONARY—East India arrow-root, wheat, and potato-flour, hydrated sulphate of lime, cochineal, lake, indigo, Prussian blue, Antwerp blue, artificial ultra-marine, carbonate of copper, white and red lead, vermilion, chromate of lead of different shades, gamboge, sap green, Brunswick green, arsenite of copper, Indian red, brown ferruginous earths, etc.

PICKLES—Salts of copper.
PEPPER—Wheat and pea-flour, ground rice and mustard-seeds, linseed-meal, pepper-dust.

STUFF—Chromate of potash and lead, ferruginous earths, red and white lead, carbonate of ammonia, lime, powdered-glass, powdered orris-root.
CATENY PEPPER—Ground rice, mustard-husk, salt, red lead, bi-sulphuret of mercury, Venetian red, turmeric, brick-dust.

GINGER—Wheat, sago, and potato-flour, ground rice, mustard-husks, turmeric-powder.

HONEY—Flour, cane-sugar, chalk, pipe-clay.

LARD—Potato-flour, water, mutton-suet, salt, carbonate of soda, caustic lime, alum, potash.

MUSTARD—Wheat-flour, turmeric, yellow ochre; chromate of lead.

Figure 4.
a, Ovum of Acanthamoeba; b, c, e, Acanthamoeba; d, f, Vibrio.

Such are the results of the investigations, which we have referred. In view of the diversity of the constituents, which is shown by the above list to enter into our daily food, the naturalist might classify man as an omnivorous animal, in the broadest sense. Judging us by the amount of ferruginous earths, chalk, pipe-clay, plaster of Paris, etc., that we are obliged to swallow in our daily bread, we might also appropriately be ranked with the clay-eaters of Siam or Kamtschatka. Fortunately indeed if we are not pinched with colic, prostrated with paralysis, and irrecoverably poisoned through the insidious effect of the most destructive metallic salts and oxides with which our food is seasoned.

Many foreign articles come to our markets surcharged with villainous compounds; while the modes of adulteration in this country differ but little from those employed in England, except in cases where the required material is cheaper or less available. The four varieties of starch represented in Figure 1, (see RURAL of last week,) as seen in the field of the microscope, will il-

lustrate, though imperfectly, the discriminating power of that instrument: we say imperfectly, for it is impossible to represent in an engraving of this kind the more delicate shades of difference that characterize them in the eye of the observer. The difference in size, however, of these and other varieties of starch granules, is generally sufficient to distinguish them from each other, varying, as they do, from the one hundred and eightieth part of an inch—the size of potato-starch—to the twelve hundredth part of an inch, about the average diameter of the granules of buckwheat starch.

The characteristic shapes exhibited by the granules of the potato, sago, and tapioca starches, and West India arrow-root, under the microscope, are

sufficient, independently of their relative sizes, to distinguish them. The oyster-shape, and the distinctness of the concentric rings having their common focus, if we may so call it, at one end, mark the potato starch; the oblong form, truncated at one end, that of sago; the irregularity of form, sometimes even becoming triangular, that of maranta, or West India arrow-root; the more nearly circular form, and the tendency to compound granules, consisting of two, three, or even four united, that of tapioca. Thus by the microscope, and by that alone, we detect the adulteration of sago with potato flour; tapioca with potato flour and sago meal; and West India arrow-root with all three.

Bread in itself contains nearly all the elements, and in almost the requisite proportions, indispensable to the sustenance of man: nerve and sinew, bone and adipose tissue, alike gather strength and fullness from its substance. It is, more

than any thing else, the universal pabulum of civilized man. Not inappropriately, then, has the word “bread” become the synonym of food. Such is the universal necessity, such the unceasing demand for, and enormous consumption of, bread, that the adulteration, even to a moderate degree and with the least hurtful materials, becomes a great wrong to the public: but the revelations of the microscope and the test-tube show that the avarice of the dealer has not spared even the “staff of life.” Figure 2 (see RURAL of last week,) represents the starch granules of different varieties of flour, as seen by the microscope, and illustrates the ease with which the more innocent modes of adulteration—the mixture of inferior with the more valuable farinas—are detected. The starch is readily separated from the gluten, by making a thick paste of the flour, wrapping it in a piece of cotton cloth, and kneading it with the fingers while a very small stream of water is running over it. The starch washes through the cloth, and will subside readily in the water, and may be easily transferred to the microscope. If it should be a sample of damaged flour, you may find scattered here and there in the field of the instrument, the different varieties of fungus growths depicted in Figure 3, b, c, d, of which b, (Puccinia Graminis,) is commonly known as *rust*; c, (Uredo Caries,) as *pepper-brand*; and d, (Uredo Segetum,) as *smut*.

These fungi have often detected in an examination of samples of inferior brands of flour in New York city. They will seldom be found associated together in the same sample.

A still more uninviting picture is sometimes exhibited by the microscope, and one that is calculated to suspend the gnawing of hunger in a sensitive stomach. (See Fig. 4.)

The Vibriones Tritici exist usually in the blighted grains of wheat, as a cottony substance, exhibiting great activity except when perfectly dry. From this latter condition, however, lifeless they appear, and though they crumble at the touch, they can be restored to a lively existence by simple moistening. It has been supposed that these animalcules do not find their way into flour through the meshes of the miller's bolting-clothes; but they certainly exist in the damaged article.

The Acanthamoeba is another accompaniment of damaged flour; a, e, b, c, represent this mite in its different stages of development, from the ovum to the full-grown animal. To the adulterations of flour and bread with the inferior farina, there is another class of substances superadded that can be detected only by the aid of chemical reagents. We refer to the extensive use of alum, sulphate and carbonate of lime, and more rarely perhaps, carbonate of magnesia. The use of alum serves a variety of purposes.—First, it enables the baker to use a larger proportion of inferior flour without essentially affecting the appearance of his bread. Secondly, he can use with impunity damaged flour. Thirdly, it gives to bread, made even from the best flour, a whiter appearance. Carbonates of lime and magnesia are also used for the purpose of improving the appearance of bread and disguising an inferior quality of flour.

The effect upon health of the daily use of these substances, with some of which baker's bread is almost universally contaminated, is most pernicious. The continual use of food containing carbonate of magnesia is likely to result in the formation of the most painful calculi. We ask for bread, and they give us a stone.

The astringent effect of alum as a medicine should satisfy us of its evil effects as a constituent of food. The natural result from its continual use is acidity of the stomach, costiveness, dyspepsia. We may here state that, with scarcely an exception, alum is to a fearful degree a constituent of baker's bread in New York city; and in many instances, lime and other deleterious substances are associated therewith.—*Knickerbocker Magazine.*

Two centuries ago not one in a hundred wore stockings. Fifty years ago not a boy in a thousand was allowed to run at large at night. Fifty years ago not one girl in a thousand made a waiting maid of her mother. Wonderful improvements in this wonderful age.

YOUNG RURALIST.

STUDY AND LABOR.

Knowing that there are many smart young readers of the RURAL, who would delight to assist one who is first commencing business for himself, that is, trying to do something for a living, I would ask a plain, perhaps a simple question, so that there will be no doubt but what I shall get all the information I desire. My question is, can a man be both a student and a farmer at the same time?

Having commenced farming for my occupation during the summer, and wishing to make the best use of my time, I would, if thought best by my young friends, follow a course of study; or, if this would take too much time, reading would answer very well. My experience, as far as it goes, tells me that to make farming profitable and pleasant, I must give up studying entirely, and attend to one thing at a time. For instance—the other day my employer sent me to the village expressly on business; and for fear lest my memory should prove treacherous I took my errands with me on paper. I had a good time riding to the village, thinking of what I had read a few days previous. When I arrived there, hastily glanced at my paper and read my errands. Having got what I supposed was right, took my homeward way, and finished my review, in mind, of the history of the Carthaginians. When I returned home, I found that I had, through my great engorgement to return to my train of thought, made a grand mistake, both in quantity and quality of the article I had expressly gone after. You can imagine my feelings. I most emphatically felt ashamed of myself. This, I think, conclusively proves that to follow two employments, is neither profitable, nor, to meet with the success that I have met with, pleasant. Advice wanted.

Pompey, N. Y., 1859.

REMARKS.—Although we leave these questions to be answered by Young Ruralists, yet we will make a remark or two. It is difficult to do two things at once, and it is equally difficult to do one thing well unless the mind as well as the hands are engaged in the work. But, because a man has to sow and reap, or build houses, or edit a newspaper, it does not follow that he should not read, inform his mind, and become interested in other subjects not directly connected with his business. What we should learn is to gain such control over the mind as to be able to direct our thoughts to the business in which we are engaged, and keep them there until it is accomplished. Our young friend needs mental discipline.

GET A RAPID GROWTH.—As a general rule the object of the young gardener, and old gardener too, should be to get a rapid and constant growth on everything he plants. If anything occurs to check or suspend the growth of a plant, it is very hard to get it started again. It is often better to sow again than to wait for the sickly plant to recover. My promised letter about growing melons I will give the boys next week. It won't do to start them too early, or the cold nights we have occasionally at this season will stunt them, which is just about as bad as killing them outright.

OLD GARDENER.

LACK OF REVERENCE IN THE YOUNG.

REV. A. SMITH, Commissioner of Public Schools in Ohio, in a recent report, makes some forcible remarks upon the want of good manners shown by the youth of the present day in their conduct toward the aged. After alluding to the deference and respect which the youth of former days were taught to extend to their superiors in age and wisdom, he says:

But where, in all our land, does this good old practice now prevail? Who does not know that bows and courtesies on the part of our boys and girls are obsolete? It has been remarked that “there are thousands of boys in this great country, not one of whom has ever made a bow, unless when he had occasion to dodge a snow-ball, a brick-bat or a boulder.”

Some eight or ten winters since Ex-Governor Everett, of Massachusetts, with the late Amos Lawrence, was in a sleigh, riding into Boston. As they approached a school-house a score of young boys rushed into the street to enjoy their afternoon recess. Said the Governor to his friend, “Let us observe whether these boys make obeisance to us, as we were taught fifty years ago.” At the same time he expressed the fear that habits of civility were less practiced than formerly. As they passed the school-house all question and doubt upon the subject received a speedy if not satisfactory settlement, for each one of twenty juvenile New Englanders did his best at snow-balling the wayfaring dignitaries.

DON'T BE HASTY.

1. Because you will be likely not to treat rightly two very good friends, Reason and Conscience, who will not have a chance to speak.
2. Because you will have to travel over the same ground in company with one Sober Second Thought, who will be more likely to have him a whip of scorpions than a bunch of flowers.
3. Because the words or actions involved in it are more likely than otherwise to be misunderstood, and therefore to be severely judged.
4. Because this is one way to please and give great advantage to a great enemy of yours, one powerful enough to be called “the Prince of the World,” and who has caught more people than can be counted in this very trap.
5. Because in so doing you are likely to be a fellow-traveler in such company as follows:—“He that is hasty with his feet sinneth.” “He that is hasty of spirit exalteth folly.” “Seest thou a man hasty in words? there is more hope of a fool than of him.” “The thoughts of every one that is hasty tend only to want.”
6. Because such a fire may be kindled that it cannot be put out even by all the water a whole engine company can throw, with Second Thought for their captain.

MOORE'S RURAL NEW-YORKER

NEWS DEPARTMENT.

ROCHESTER, N. Y., MAY 14, 1859.

The European War Question.

The news brought by the Niagara, (which will be found in detail in its appropriate column,) brings Continental matters directly to the point to which they have for months been tending—War is considered inevitable. France is concentrating troops upon Toulon, which is only twenty-four hours sail from Genoa; and other troops are proceeding toward the Piedmontese frontier by forced marches. From Vienna large masses of troops are constantly moved forward by rail to Milan. Sardinia is bringing up her forces for the defence of her eastern frontier, where she will soon have the assistance of the French arriving by the way of Genoa, across the country by the coast route, and over the Alps by the Simplon. England remains impassive, and apparently more busied with the parliamentary election than the war. It does not seem probable that she feels constrained to assist Austria in the maintenance of the Treaty of 1815. If she is indisposed to do so, she can readily plead previous violations of the Treaty by Austria, and the rejection of the peace proposals made through Lord Cowley. Prussia has called out a large army for the defence of the Rhine. It is understood that this is to be only an army of observation, to be called into action should French troops pass the Rhine. In the Papal States the Pope has been endeavoring to get up an army, with very indifferent success.

There is a legitimate cause for "this great commotion," and though the discussion of political matters, either domestic or foreign, is not within our peculiar sphere, and our readers care very little about Continental matters of such nature, present circumstances will justify a brief resume of the whole subject, for the facts of which we are, in a great measure, indebted to the Philadelphia Press: Austria, besides possessing a large domain in Germany, also holds the Tyrol, Bohemia, Hungary, a large slice of what once was the Kingdom of Poland, the countries which line the north and east of the Adriatic Sea, (down to the extremity of Dalmatia,) as well as a large portion of the north of Italy, consisting of Lombardy, which is divided into two governments, Milan on the west, and Venice on the east. These Italian territories, covering about 18,000 square miles, were secured to Austria, first by the Treaty of 1814, on the overthrow of the elder Napoleon, and subsequently, in 1816, after his exile to St. Helena. Large as this Austrian Italian province is, the Kingdom of Sardinia, which adjoins it and partly forms its north western boundary, is much more considerable, for it covers nearly 30,000 square miles, and has a population exceeding 4,000,000. The Austrians and the Italians have never assimilated, treaty or no treaty, nor is it likely that they ever will. The consequence is that Austrian Italy is almost perpetually making Austria very uneasy. To keep the excita-

ble Italians in check, an immense military force is scattered all over Lombardy, and these soldiers are most cordially hated by the inhabitants of the country.

The antipathy of the Italian to the Austrian is deadly—a hatred only appeased when it kills—and should an Italian meet an Austrian out upon the mountains, with no human looker on, the chance is that the German would speedily take leave of time. For the Italian cannot help regarding the Austrian as an enemy and oppressor who ought to be swept away from off the face of the earth. Americans who have traveled in Italy have noticed the cause of this hatred. The Austrian soldiers, from the General to the drummer, perpetually indulge in the most vexatious tyranny, whenever they can exercise it. They are willing instruments in the hand of capricious misrule. They seem to delight in annoying the natives whenever they have a chance. In this they are encouraged by their superiors. They uphold, with their bayonets, the dreadful system of espionage, secret false information, arrest, imprisonment, torture, execution.

Against this hard rule the Lombards and Venetians have long chafed. They even conspired, but nothing came of that. The Carbonari always had the misfortune to be betrayed by spies, and the Austrians ever kept them down, in the dungeon, by exile, or on the scaffold. At last came 1848—the great year of European Revolutions—in which Louis Philippe had to fly for his life and Louis Napoleon, emerging from comparative obscurity in England, went to Paris, the accepted Chief of the new Republic. Swiftly spread the flame of Revolution. There were successful revolts in Sicily, Naples, Tuscany, Parma, and Rome. Then the Austrian provinces in Lombardy demanded reforms, which Metternich refused. On this, the late Charles Albert, King of Sardinia, threw an army of succor into Venice. Eventually he was beaten by the Austrians, under Radetzky, and (in 1849) had to abdicate and resign his throne to his eldest son, the present Victor Emanuel, King of Sardinia.

With Charles Albert declined, for a time, the ambitious hope of uniting Lombardy to Sardinia, and making an independent sovereignty of the two—involving, of course, the banishment of the Austrians from Italy. In the Crimean War, good help was rendered to the Allies by Victor Emanuel, and Sardinia began to acquire caste and character as a second rate Power—the Five Great Powers being England, France, Russia, Austria, and Prussia. Ever since, the ties of amity between France and Sardinia have been drawn closer and stronger together. At the beginning of the year, Louis Napoleon angrily notified Austria of his dissatisfaction with her hard rule in Lombardy. At the same time, Sardinia publicly notified a sort of intention to interfere, against Austria, in Lombardy. Preparations of war have since been abundantly made by Austria, on the offensive, and by Sardinia on the defensive.

The foregoing is a complete view of the relations of the various governments, (Austria, Italy, France,) and the entire causes of the present disturbed state of feeling, as history will record it; but it is urged that there are other reasons for the difficulty. Two of those powers, France and Austria, are in a condition of bankruptcy—a war gives the latter opportunity to refuse the payment of interest upon the "National Debt," while it furnishes the former with a plea for a loan. The urgent need of France, pecuniarily, is exhibited when we observe that the Emperor does not wait the first blow, but with only the notes of preparation sounding in his ear, the would-be Napoleon is found in the market asking for one hundred million dollars. What the result will be it is impossible to even surmise. The strife may be confined to the powers now engaged, it may end in a general European war—in fact, we can hardly see how the latter is to be avoided. At all events, our duty is to keep clear of entangling alliances—if Europe must fight, let it be our privilege to supply the nations with food—if a Continental war is inevitable, America will be looked upon as the granary upon which the world may draw for subsistence.

The Latest War News.

Just as we were going to press the telegraph brought us still later news from Europe. The steamship *Adelaide* arrived at St. Johns on the 9th inst., and we give a brief synopsis of her news. The Austrians, 120,000 strong, are said to have crossed the Ticino, but there had been no actual conflict. Just as the *Adelaide* was on the point of leaving, however, an official dispatch was received from Paris, saying that hostilities had commenced. The French troops were pouring into Piedmont. Tuscany had joined France and Piedmont, and troops were landing at Geneva in large numbers. They were most enthusiastically received.

The most active military movements prevailed throughout France. 80,000 French troops were expected to be in Italy by the day the *Adelaide* sailed. The Tuscan army had called for the Grand Duke to join France and Piedmont, and declare war against Austria. He declined and fled, and Tuscany had declared in favor of a military dictatorship.

It was reported that Denmark had concluded a treaty offensive and defensive with France. The King of Sardinia had issued proclamations to the army, saying he regarded Austria's ultimatum as an insult, and rejected it with disdain. He had gone to join the army of Allister.

Warlike preparations were going forward rapidly in England. At Woolwich there was great activity. The government had chartered Cunard's screw steamer *Etna*, and a number of other vessels to convey troops and ammunition to the Mediterranean. There were rumors of a proclamation calling for 10,000 men for the navy. War premiums were being generally demanded at Lloyd's.

LIBERIA SUGAR.—Jesse Sharp, a sugar planter of Liberia, has sent by the Liberian brig *E. N. Royce*, which arrived at New York on the 23rd ult., 12 casks syrup, from his plantation on the St. Paul's River, near Millsburg, on which he has 280 acres of choice land for cane. The sugar he can sell at four cents per pound, and the syrup at 25 cents per gallon. He intends to send his sugar to the New York market.

Affairs at Washington.

The Government has received voluminous dispatches from Nicaragua, but they throw no new light on events in that quarter. The Belly contract has not been confirmed by the Congress of Nicaragua. The free transit passed by this body is to become a law if the President of that Republic deems it advisable to issue his proclamation to that effect. Gen. Juarez will leave the 5th of June for Nicaragua to enter the Cabinet of President Martinez. The legation here remains in charge of M. Molina, who will be charged with the negotiation of a new treaty.

Special dispatches received at the French Legation confirm the report of strong words having passed at Paris between Lord Cowley and Count Walleski, relative to the course pursued by the English Cabinet. Napoleon thinks the English Cabinet has proved false to the professed *entente cordiale*, and expresses confidence that the English people will never sanction the subjugation of Italy by Austria. The approaching election for Parliament, he thinks, will prove the correctness of his judgment.

Dispatches are being prepared at the State Department, which will go out by a special bearer to our Minister at Mexico. The Administration have determined to lend its power and influence in aiding and sustaining the Juarez Government, and thereby insure if possible its supremacy. The course pursued by Miramon taken in connection with the action of the British and French Ministers, necessitates this prompt and decided action of our Government. The British and French Ministers here have assured our Government in the most positive terms that the action of their Ministers in Mexico was without authority from the Home Government, and that their course will not only be disapproved, but severely censured.

The Government has not yet taken definite action in the troubles among the Federal Officers in Utah, but will wait for further information from that Territory, and especially as to the course of Judge Cradlebaugh. The indications are that Gov. Cumming will be sustained by the Administration—his conduct being regarded as wise and conciliatory. Such instructions will shortly be forwarded to Utah as will prevent further difficulty among the Federal Authorities. From all that can be ascertained, no trouble is apprehended among the Mor-

Another dispatch says:—"The Mormon troubles appear to be speedily and permanently settled. It seems that Brigham Young has submitted a proposition to a company of capitalists to sell all right and title to Utah Territory, and to leave the Territory within a specified time. Some of the company are here consulting with the Administration; they desire the aid of Government in carrying out this undertaking, and it is probable that the Government will lend them all the aid in its power. If it cannot be effected in any other way, the subject will be laid before the next Congress."

The Treasury receipts for the quarter ending April 1st, were nearly \$22,500,000, including upwards of \$3,000,000 from customs, and between \$3,000,000 and \$4,000,000 from the loan of 1858. The expenditures for the same period were nearly \$18,000,000, including \$3,000,000 for the redemption of treasury notes issued under the act of Dec., 1857.

Personal and Political.

The Hon. Wm. Slade, Jr., of Cleveland, is spoken of as a candidate for the Republican nomination for Lieut. Governor in Ohio.

The Legislature of Connecticut has organized by choosing Republican officers in both Houses.

FERRAND F. MORRELL, Esq., for many years Secretary of the State of Vermont, and one of the most prominent citizens of that State, died suddenly at Montpelier, his place of residence, on Monday week, aged about forty-five years.

The receipts into the Connecticut State Treasury, last year, were \$339,911, and the expenses \$327,500. The State debt is only \$48,620. Her School Fund is \$2,043,375, which produces an income of \$143,308. Her State Prison has yielded a revenue of \$1,571 60.

The "States Rights Democracy" of Pennsylvania, in the person of the State Central Committee, are in session at Harrisburgh. They have resolved to adhere to the doctrine of Popular Sovereignty against that of Congressional Intervention, whether advocated by the Democrats for the extension of Slavery, or by the Republicans for the opposite purpose.

A LETTER from Texas states that Gen. Samuel Houston is the candidate for Governor in that State, of the Independent or Anti-Convention Democrats, in opposition to Gov. Rannels, the candidate of the Convention Democrats.

The Washington *Republic* names as prominent candidates for the nomination of the Charleston Convention, as President, Generals Harney, Wool, Jessup, Commissioner Bowlin, and Secretary Cobb. Mr. Orr will, it thinks, if he cannot get the first place on the ticket, take the second.

NEW YORK lost one of her most eminent advocates and jurists, on the 1st inst., in the person of Nicholas Hill, who died at Albany, of brain fever.

MR. GREENEY announces in the *Tribune*, that he proposes taking a trip westward this season through Kansas and the alleged gold regions at the eastern base of the Rocky Mountains, thence through Utah and the Great Basin to California, returning across the Continent or by the Isthmus, as circumstances shall dictate. He purposes an absence from May 10th to the middle of September.

DEATH FROM SWALLOWING A NICKEL CENT.—The Lansingburgh Democrat says that a little child of a Mr. Lovjoy, residing in the south part of that village, came to its death a few days since, from the effects of swallowing one of the new nickel cents.

MORE GUANO DEPOSITS.—Some excitement existed at Honolulu, at last accounts from the Sandwich Islands, on account of the alleged discovery of new guano islands, the location of which was not disclosed. The deposits were more than five feet deep, and very rich.

News Paragraphs.

In Essex County, Mass., the value of the wild pigeons annually captured is \$20,000. In some towns 3,000 dozen are taken every year. They bring about a \$1 a dozen in the Boston market.

The Republic of Hayti has commissioned two colored gentlemen, Toussaint and Mardon, as Ministers to London, where they have been received officially.

A fashionable Paris tailoring firm advertise that "they offer at all times to the purchaser new articles of a late pattern, for the reason that all those remaining at the end of each year are exported to America." It would thus appear that the Paris tailors send their old clothes to the United States.

One of the Paraguay steamers that the government gave \$44,000 for has recently been sold for \$4,000. The severest punishment, says the Providence Journal, that could have been inflicted on Old Lopez, would have been to make him take half the fleet at the government price.

ADVICE from Iron Mountain, Lake Superior, near Marquette, to April 14th, report the snow four feet deep; weather clear and cold, thawing a little in the middle of the day.

The Legislature of Maryland, at its last session, passed a law prohibiting lotteries after the 1st day of April, 1859. It seems, however, that the law is inoperative and worthless, by reason that no penalty attaches to its violation.

The Rev. W. E. McLaren, formerly attached to the editorial corps of the Cleveland Plaindealer, is preparing to depart for Japan, where he will hereafter devote himself to Missionary service.

The Episcopal Church in Canada is divided into *velo* and *non-velo* parties; the one sustaining the right of the Bishops to negative the action of the Church Synods, the other denying such right. The recent election of lay delegates at Quebec and vicinity turned upon this point and considerable excitement was the result. The *non-velos* were generally in a majority.

Or the once powerful tribe of Pequot Indians, there now remain fourteen males and seventeen females, residing on a reservation of 180 acres, in the town of Ledyard, Conn.

There have been cut during the winter 100,000,000 feet of logs in the Green Bay lumber region, nearly all of which will be shipped to Chicago during the coming season.

It is stated that \$70,000 have been collected for the establishment of the new Museum of Comparative Zoology in Boston; which, with \$50,000 donated by Mr. Gray, makes the whole available fund \$120,000, exceeding by \$20,000 the sum required by the legislative enactment to insure State aid to the amount of \$100,000 more. Ground for the Museum will be broken this summer.

REV. MR. ALEXANDER, of Kentucky, for 26 years Missionary at the Sandwich Islands, arrived with his family in New Bedford on Sunday week, in the ship *Mountain Wave*, from Honolulu.

Latest Mexican Intelligence.

OFFICIAL advices from Vera Cruz received at Washington mention a rumor that the principal cause of Degollada's retreat was the destruction of his ammunition by the explosion of a shell at Tacubaya. The only cities in possession of Miramon are Cordova, Puebla, Orizaba and Mexico. Three thousand troops under Ampudia were marching toward the last named city. Gen. Garcia was also moving in the same direction by the way of Huasteca with 1,500 men. These would be joined by 400 more from San Luis Potosi together with Degollada's forces and others from the south. The reactionist army in the city of Mexico does not number more than 6,000 men. The Juarez government speaks in confident terms of its ability to conquer the Capital.

It is known here that our government can obtain the right of way over Mexican territory to Arizona, with an outlet at Guaymas, on the Gulf of California. The importance of such an arrangement has for months occupied the attention of our government, especially with reference to saving time and expense in the transportation of supplies and troops to the Pacific. It is highly probable that these subjects will be embraced in the instructions to Minister McLane, as calculated to strengthen the friendship between the two countries.

The New Orleans Picayune of the 6th inst., on information from Vera Cruz, says Mr. McLane had, when the last steamer left, about abandoned the idea of going up the Table lands for the present, both, because of the distracted state of the country, and the desire to be nearer the government with which he is in official communication. He designed, however, to go on board one of the ships-of-war at Sacrificios, probably the *Savannah*, till her relief by the *Saratoga*. He proposed to put himself in communication with the leaders of the opposing parties, for the purpose of protecting the lives and property of American citizens.

FROM CALIFORNIA.—The California Overland Mail arrived at St. Louis on the 5th inst., bringing San Francisco dates of April 11th. News unimportant. Markets unchanged. This mail brings advices of another conflict on the Colorado between the Indians and a party of men under Mr. Bishop, who were on their way to join Lieut. Beale's surveying expedition. This party were proceeding along, as they supposed, in perfect security, having distributed considerable presents to the Indians on the route, and received their permission to pass through the country, but on arriving at the crossing of the Colorado, they were, on the 20th of March, suddenly attacked by a party of some 600 or 700 Indians of the Mohun, Yuna, and Phante tribes.

A desperate fight ensued which lasted for three hours, during which a large number of the Indians were killed. Bishop had retreated toward Fort Tejon, and sent thither to Col. Hoffman for assistance.

VETERINARY PROGRESS.—There is now going up, in Twenty-third Street, near Sixth Avenue, New York, a splendid edifice for the College of Veterinary Surgeons, which is to cost about \$40,000.

The News Condenser.

—Gold diggings have been discovered in Vermont.

—General Cass has been again quite seriously indisposed.

—The valuation of property in Cincinnati is \$110,000,000.

—Strawberries from the South sell in New York for \$2 a quart.

—Several schooners are loading with staves at Detroit for Liverpool.

—Copper ore, very pure, has been discovered in Mo-Henry Co., Ill.

—The manufacture of silk was introduced into Europe in the year 551.

—The population of Cincinnati is estimated by the Gazette at 200,000.

—The expenses of Congress being \$5,068,523, each member costs \$16,354 03.

—Two children and a man in Chicago were bitten by a mad dog on the 80th ult.

—The Boston banks now hold over \$2,000,000 in coin, and the amount is increasing.

—The wool growers are to hold a convention at Cleveland, on the 4th of August.

—A Dublin writer asserts that fully one-half the people of Ireland are Protestants.

—According to the Detroit Advertiser, the population of that city now numbers 75,000.

—London is rapidly extending its boundaries. It now covers an area of 121 square miles.

—The city of Providence, R. I., has contracted for two steam fire engines, costing \$10,000.

—Ninety-nine liberated slaves and thirty free negroes are about leaving Baltimore for Liberia.

—A cow in Woburn, Mass., lately ate 20 pounds of white lead, and has survived the repast!

—A letter from Fraser river says that women are at a premium there "inexpensive by figures."

—Two cargoes of ice—three hundred tons—have been received at Buffalo, from Lake Superior.

—Rents in New York are said to be very high, and real estate almost everywhere on the advance.

—The Albany police are to be provided with a uniform like that worn by the police in New York.

—The announcement of the death of De Toqueville was premature. He was very ill at last accounts.

—Three children have recently been poisoned in Georgia by eating the flowers of the yellow jasmine.

—Another company of boys have been sent from New York to the West, by the Children's Aid Society.

—The Nova Scotia Parliament has been dissolved. The writs of election were returnable on the 12th inst.

—It is said that Sir E. Bulwer Lytton will make about £15,000 out of his last novel, "What will be With It?"

—A pair of fine sturgeons, each three feet long, have been added to the Aquaria at the Aquarial Gardens, in Boston.

—Theatrical performances are now given in the city of New York in English, French, German, and Italian.

—In Vienna an order was recently issued prohibiting the employment of Christian servants in Jewish families.

—A letter from Rome, dated March 24th, says there were four hundred Americans in Rome during the carnival.

—There are one thousand five hundred square miles of ice in the Alpine ranges, from eighty to six hundred feet thick.

—Our American dinners gave Frederika Bremer the dyspepsia, and she is still, at 60 years of age, scolding about them.

—Never confide in a young man; new pals leak. Never tell your secrets to the aged; old doors seldom shut closely.

—The skeleton of a giant, eight feet high, has been exhumed from the farm of Mr. Colvin, near Monongahela City, Pa.

—A salt cellar of the Henry II pottery—of which were only thirty-two pieces exist—was lately sold in Paris for \$2,320.

—The Arch Duke Maximilian d'Este is loyal—he has given his whole fortune, 80,000,000 of zwanzigers, to the Austrian cause.

—Thirteen thousand sailors have deserted the service of Queen Victoria during the past three years, leaving \$130,000 due them.

—The N. O. Picayune has intelligence that the sugar crop of Southern Cuba, now nearly all in, falls far short of that of last year.

—Professor Olmsted, of Yale College, is said to be so ill of neuralgia of the stomach that his recovery is considered very doubtful.

—A sum of \$146 has been subscribed in Scotland for the relief of the distressed agriculturists in Huron and Bruce counties, C. W.

—A correspondent of the Providence Journal says that green shoots of asparagus, eaten raw, will cure hydrophobia at any stage.

—The National Typographical Convention has been in session at Boston, Mass. The next session will be held at Nashville, Tenn.

—A stranger from Virginia arrived at New York on Thursday last, bringing 700 barrels of green peas and 10 cases of strawberries.

—It has been an extremely good sugar season in Vermont this spring, and in some instances the yield has been ten pounds per tree.

—The iron trade is slowly reviving. All the smelting furnaces on the Schuylkill, between Philadelphia and Norristown, are in full blast.

—The National Convention of Homeopaths will meet in Boston the 1st of June. It will wind up with a ball and levee at Faneuil Hall.

—Judge Cradlebaugh, United States Judge in Utah, whose course brought him in conflict with Governor Cumming, has been removed.

—Mrs. de Paris banker, lately gave a ball which cost \$25,000! He commenced life by selling old shoes—then, as now, a *grate* financier.

—A child in New York, four years old, in the absence of its mother, got hold of a gin bottle and drank freely and died in two hours thereafter.

—The steamship *Vanderbilt*, which left N. Y. on Saturday, took out three horses for Napoleon, from Jerome Napoleon Bonaparte, of Baltimore.

—The bell swinging in the tower of St. Stephen's Church, East Haddam, Ct., is over a thousand years old! It bears the date of A. D. 815.

—The young Bavarian, wife of the heir to the throne of Naples, distinguishes herself at the hunting lodge of Caserta by driving out four-in-hand.

—A steam fire engine weighing 6,000 lbs. has been ordered for Lowell, Mass. The whole number of men attached to its fire department is 328.

"PROGRESS AND IMPROVEMENT."

[SINGLE NO. FOUR CENTS.

VOL. X. NO. 21.]

ROCHESTER, N. Y.,—FOR THE WEEK ENDING SATURDAY, MAY 21, 1859.

{WHOLE NO. 489.

MOORE'S RURAL NEW-YORKER,
AN ORIGINAL WEEKLY
RURAL, LITERARY AND FAMILY NEWSPAPER.

CONDUCTED BY D. D. T. MOORE,
With an Able Corps of Assistants and Contributors.

THE RURAL NEW-YORKER is destined to be unsurpassed in Value, Purity, Usefulness and Variety of Contents, and unique and beautiful in Appearance. Its Conductor devotes his personal attention to the supervision of its various departments, and earnestly labors to render the RURAL an eminently Reliable Guide on all the important Practical, Scientific and other Subjects intimately connected with the business of those whose interests it zealously advocates. It embraces more Agricultural, Horticultural, Scientific, Educational, Literary and News Matter, interspersed with appropriate and beautiful Engravings, than any other Journal—rendering it the most complete AGRICULTURAL, LITERARY AND FAMILY NEWSPAPER in America.

All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.
For Terms and other particulars, see last page.

WHAT IS THE USE?

THIS is an exclamation we sometimes make, almost unconsciously; and last week, while rambling through the country east of this city, in company with a friend, as usual we became absorbed in reflections awakened by what our eyes beheld. No doubt we were quite uncompanionable, for thought was too active to admit of words, so we passed on in silence. At length the silence was broken by the inquiry of our companion—"What is the use of what?"—you have been asking, "what is the use?" half-a-dozen times within the last fifteen minutes, and if I knew what you meant I would give you the necessary information, so as to stop further inquiry."

Feeling a little chagrined that we had been thinking aloud all this time, we explained that it was only a habit we had of unconsciously speaking our thoughts, when very much interested or a little excited—a habit, no doubt acquired by our custom of making such rambles alone. But we had to explain the circumstances which caused such outbursts, which we did somewhat as follows:

Did you not see that long line of Osage Orange hedge back a mile or two. It must have been planted two or three years, long enough almost to make a hedge that would turn any animal. It looks as though it had been well planted; but is no nearer forming a hedge than when first set out, although the tall, straight shoots of last year, are four feet long. It has not been cut back, and the base is thin and open, the grass is thickly matted about the stems and over the roots, and unless attended to soon, it will be ruined. The plants and planting must have cost somebody a good deal of money, and would have been a first rate investment had it been cared for, but now it is likely to be a total loss, besides being a source of vexation and regret. *What is the use of wasting money and labor in this way?*

You recollect that boy in the field to the left, who was supporting himself with the hoe, and who sat so still and motionless that we could hardly tell whether he belonged to the genus *homo* or the genus *oceros*. No wonder he was discouraged in view of the hopeless task assigned him, of breaking up those baked clods of clay. He may succeed in pulverizing a few of the hard-heads on the surface, if he ever wakes up, but what will this avail, as the soil is as solid, even more so, than tho' it had never been plowed. The object of plowing is to pulverize the soil; but this was not pulverized; it was only turned over and pressed together, making it lay in unbroken brick. *What is the use of plowing clay land when it is so wet?* It will take years to overcome the injury thus done to the soil. Clay land should be quite dry when plowed, and a narrow furrow should be turned so as to effect its division and pulverization as much as possible. The English understand and practice this rule, and even then they use a clod crusher with spikes or teeth that penetrate the soil, and break up the clods. Is it not enough to make one cry out, *what is the use, to see such practices?*

Again, did you not see that fine farm-house on the right? It is tastefully built, looks convenient, is well painted, with good barns and out-houses. It must have cost several thousand dollars, and is really pretty, and worth the money, but its beauty is spoiled by the unsightly grounds in front. They are low near the road, and wet, and rushes and tufts of coarse swamp grass abound. This had

been set on fire, and the door-yard, instead of presenting a cheerful aspect this pleasant spring weather, looked as black and desolate as a prairie after burning in the autumn. What is the use of spending so much money for the purpose of producing a good effect, and having everything nice, and then spoiling the whole to save a week's labor at filling, up and a few dollars in draining?

LINSEED CAKE IN ENGLAND.

The amount of Linseed Cake used in England may be judged somewhat from the fact that the official returns show that in 1857 there were imported into the United Kingdom 8,800,000 bushels. The use of Linseed Cake has increased steadily and rapidly for the last twenty years. In 1842 less than three million bushels were imported, and in 1852 about six millions. The total value of Linseed consumed annually in Great Britain is estimated to be about ten millions of dollars. Too little attention is here given to this most valuable food for stock, or we believe much more would be consumed at home and less sent abroad. We remember when not one farmer in a hundred knew it was good for food, and the venerable John Johnston, of Geneva, was the school-master to many in this respect.

But Linseed Cake, like every other good thing, must suffer adulteration, and the English public are becoming aroused on this subject, and are seeking to remedy the evil. The Linseed, as well as the Cake, is adulterated, generally with Wild Rape, Mustard, Millet, &c. A delegation of London dealers appointed for the purpose, called upon the leading Greek houses, who are the principal ones concerned in this fraud, to protest against the practice of adulteration. They failed, however, in the object, for the Greeks showed that it was the competition among the English dealers and their anxiety to obtain cheap seed that caused the evil complained of.

The Americans are accused of having a hand in this adulteration, and a writer in the *Journal of the English Agricultural Society*, says:—"Our brethren across the Atlantic have studied the art of manufacturing Linseed Cake. What they produce is faultless to the eye, and, if not always perfect to the taste, it is thin, tender, flaky, and finds a ready sale in this country at the highest market price of the day, the question of genuineness being left entirely for subsequent determination. The Cake pleases the eye, and is always in good demand; and what more is required? Farmers have only themselves to blame in this respect. A considerable quantity of Cake is now used for feeding sheep, and for this purpose Cake of a tender kind, such as this, is preferred; it is produced by the addition of bran in its manufacture. Thus the farmer has to pay \$50 or \$55 per ton for Cake which pleases the eye in this country, but omits to consider that for this he has to pay dearly for the admixture of bran, which costs \$20 or \$25 per ton, and in the United States probably about half that price."

We cannot say whether this charge is true or not, but we do know that much of the seed brought to the oil mills in this country, and from which the Cake is made, generally contains much foul seed, and this is not designedly mixed, but is the result of careless culture on the part of our farmers.

FORESTS AND SHADE TREES.

I believe in "progress," but I am inclined to think that our Creator arranged some things pretty well as long ago as when we were quite small.—Touching forest trees, it is generally conceded that He made a great mistake in cumbering the earth with so much useless shrubbery, subjecting us to unnecessary labor in "clearing the ground."—Some are willing to compromise the matter by tolerating a few trees, provided always they can be kept out of sight in the rear of the farm. The general doctrine, expressed or understood, is, that forests are the enemies of civilization, barriers to progress, to be put out of the way as soon as possible. Coal will do for fires; brick, stone and metals, answer for buildings and machinery; what special need of wood?

After all, I wonder that some one having a pretty good opinion of Divine Providence has not ventured to inquire whether, really, trees "were made in vain" IN WHOLE OR IN PART! Should such inquiry be made it would take us back to the early history of the race when men were few and trees were many. It would be seen that a sparse population could subsist on game and such fruits and vegetables as had a spontaneous growth. With the increase of population there would arise a necessity for cultivating the ground, but there would be no use for all the timber growing on the ground needed for cultivation. After buildings, implements, and inclosures, &c., were provided for, the balance of wood material might have been converted into charcoal, which, if judiciously used as

an absorbent and applied to the soil, would, with other possible appliances, have kept the human race without famine or short allowances, on one-tenth of the area that has been denuded of forests, impoverished, polluted,—in short, "reduced to cultivation." In other words—mankind have done their best to turn the forests to the least account. Intent on exterminating them, they have neither inquired whether there was a real necessity for occupying the ground on which they stand, or whether there was a profitable use to which the timber they were removing could be applied.

Forests were so prominent a feature of the earth when man took it in charge from its Maker it would seem as though the inquiry would have been often and more earnestly made, "Would it not comport with the Divine Arrangements to retain by systematic and enforced provisions, legislative and otherwise, a greater portion of the dress with which Omnipotence decked His creation?" A friend who has related to his memory, many beautiful monuments, planted and protected by his own hands, has submitted to my consideration several reasons in behalf of shade trees, as follows:

A single row of shade trees on the sides of the street, in a small village will make every \$1,000 of real estate worth \$1,100 in five years. A dozen trees, maples, horse-chestnuts, elms, with a half dozen untrimmed evergreens, judiciously arranged about a farm house, will add \$5 per acre to the price of a hundred acre farm. A very ordinary house may be made very respectable by a neat yard, well stocked with trees. Many cords of fire wood may be saved by a grove of evergreens and other trees on the windward side of a house. I ascertained by actual experiment that a room shaded by a single row of maples was cooler by 17 degrees in a hot day than another room similarly situated except the maples. In case of fires, green trees protect buildings from flames raging near by and also afford great shelter to the firemen.

It may be late in the season to transplant trees, though it is early enough for evergreens, but it may not be too late to protect trees already planted from cattle, horses, &c., and without protection they had better remain in the forest or nursery.

Important as these considerations certainly are, in reference to shade and ornamental trees, there is the more significant inquiry, what are to become of our forests? The failure of springs and streams, the terrible force of the winds, the unusual severity of the winters, and in many places prospective barrenness, all in consequence of the loss of our forests, should induce efforts to stay the desolation. If farmers could be persuaded that they could produce as much from fifty acres well tilled, as from a hundred indifferently managed, would they not be willing to till the fifty and devote the balance to trees?

In this matter our Government has something to do. Let it refrain from bringing lands prematurely into market. No necessities of the National exchequer can justify the sacrifice of property that belongs not so much to us as to humanity. We have no business to desolate the earth, and unfit it for the purposes of human life. Save, then, ye men in power, the Western wilderness, its soil and its timber for generations that will succeed us.—Let them have the benefit of cheap lands, clothed with verdure by their Heavenly Father. Bring no lands into market till there is an absolute necessity. Will the President and Congress heed?—H. T. B.

THAT APIARIAN CONVENTION.

In the whole round of farming operations there is no one point so much in the dark, or where there is so much presumptuous conceit, so much pretension with so little knowledge to support it, so much contradictory teaching, as in Bee-Culture. Every man that has raised a half dozen stocks, presumes he has the whole secret of success, and forthwith issues his instructions through some newspaper whose editor is as ignorant as the writer, and cannot decide between ruinous and valuable teaching. The candid inquirer, desiring reliable information, is disgusted with the subject in the vain attempt to separate anything valuable from the mass. At present there seems to be no other way but for each one to investigate for himself. The experience of a quarter of a century with hundreds of stocks, is not distinguished from that of three years, and a half-dozen hives. If the inquiry is made as to who is reliable, but few can answer, because no proof or test is demanded by those whose duty it is to give a reply.

Mr. Kirtley, the only one we are sure was present at the "Convention that met on the 5th day of Feb., 1859," (see RURAL of April 23d,) has shown, in what he had to say, that he is himself only in the rudiments of bee-culture; being ignorant of their natural habits, and deficient in practical experience. That he is ignorant of one important point of natural history, can be proved by an extract

KIRBY'S LITTLE BUFFALO HARVESTER,—AS A MOWER.

ALTHOUGH mowing and reaping machines are becoming a necessity to every farmer who grows grain and grass to any extent—and who would keep pace with the age and successfully compete with his neighbors,—yet there is one class of farmers (and a numerous class,) whose wants have not hitherto been supplied, in consequence of which they have been placed on an unequal footing, and labored under disadvantages. We refer to those whose farms are not large enough, or who do not grow a sufficient amount of grain or grass, to warrant them in purchasing the large and more expensive machines, and who frequently keep but one horse for such purposes. The machine above represented, intended to supply this desideratum, is thus described by the manufacturers:

"To meet the wants of a large class of farmers, the manufacturers offer the *Little Buffalo Harvester*, a one-horse Mower and Reaper, which has proved to be a perfect success. Kirby's American Harvester having proved to be so successful in its work, and so light in draft—far excelling all other machines yet invented in this particular—it occurred to the manufacturers that the long-sought desideratum, a successful One-Horse Harvester, might be constructed upon the same principle.—They accordingly instituted experiments which resulted in the production of the *Little Buffalo Harvester*. They constructed patterns and built a few of these machines in the spring of 1858, and put them into the hands of practical farmers, with directions to test them as thoroughly as it was possible to do in all kinds of work throughout the season, and not to spare nor favor them in any manner. The result of the season's test was a perfect triumph for the machine, and they now offer the *Little Buffalo Harvester* to the public as a thoroughly successful machine, both in Mowing and

Reaping, and the only One-Horse Combined Mower and Reaper that has yet proved successful, and the only one now in market.

"Kirby's *Little Buffalo Harvester* is constructed upon the same principle and possesses all the distinguishing characteristics of Kirby's American Harvester, illustrated and described in a late number of the RURAL. Like the American Harvester it is made mostly of iron; has the same independent action of finger-bar, enabling it to work on rough ground, and permitting the cutters to be set at any height both for mowing and reaping; a lever at the driver's side by which he can elevate the finger-bar to pass over cut grass or obstructions, or move from field to field; another lever in front of the driver to throw the cutters out and in gear; a balance-wheel driving head; the driver's seat so arranged that the driver's weight balances the weight of the frame and takes the pressure off the horse; freedom from side draft and clogging; light draft; low price;—all these desirable features are combined in the *Little Buffalo Harvester*. It cuts a swath but one foot narrower than the American Harvester, and is capable of cutting from 8 to 12 acres of grass, and from 10 to 15 acres of grain per day; and, although it performs as much work as most two-horse machines, it is easily handled by one horse. Both thills and pole are furnished with each machine, so that it can be used with a single horse, or a span of ponies, at pleasure.

"These machines are being extensively manufactured by the Buffalo Agricultural Machine Works, Buffalo, N. Y.,—D. M. OSBORN & Co., Auburn, N. Y., and A. S. CLARK, Bellows Falls, Vt., and are for sale by their Agents throughout the country. Every machine is warranted."

The *Little Buffalo Harvester* as a Reaper, will be illustrated in a future number.

from what he said:—"The same Being has also taught them to deposit their honey at the top of their hives, and their bread and brood combs at the bottom. Consequently we find that, during the winter, in a hive that stands in its usual position, the bees, after the cold weather sets in, collect in the upper part of the hive, where they have previously provided and placed their food." This is a serious blunder for one who criticises so boldly. The bees never voluntarily leave the brood combs and "collect in the upper part of the hive where they have stored their honey." If by any circumstance a colony is forced to cluster among combs all filled with honey, it cannot be wintered in the open air, by Mr. Kirtley or any one else—empty cells are all important. The old Indian's story was "two-thirds true." This one is half—the honey is in the upper part of the hive generally,—that the bees cluster there at the beginning of cold weather, is not true, as any one who presumes to teach the public ought to know, and might know if he had ever taken the trouble to examine. To say now that he did know, would only make it appear that what he said was in spite to me, and slow him dishonest—ignorance is more readily excused than

In all prosperous colonies the bees will continue to rear brood till the honey fails in the flowers; as cold weather approaches, this brood matures, and leaves a few thousand empty cells. If the rest of the combs are filled with honey, then among these empty cells is where the bees cluster for the cold weather. This thing is easily decided—let it be examined.

All the twaddle about "perverting the laws of

God," amounts to nothing. There is hardly a man living but does it in a similar sense every day! It is done in ten thousand forms. Why does man cut down the forest? God made it. Why invert the soil? He formed it as it is. Why so presumptuous as to cut out the thick set branches of our fruit trees, letting in sunlight and air, making them comely in shape, and productive in good things, or pluck the weeds from his garden when God in his goodness has made them grow? If Mr. Kirtley is willing to take all things just as God has left them,—in a state of nature,—he would prefer the wheat in the kernel, the apple and peach bitter, sour, or poisonous, the potato as found wild, and trusting to Nature's planting all these. If man has nothing to do?—if God has done all?—why was it necessary for man to "dress and keep the garden of Eden?"—or why have "dominion" of all beasts, birds, &c.—was it not for some purpose? When man brings from a southern clime, from Nature's conservatory exhibits the orange in all the beauty of its native clime, when protected from the rigor of our northern winter, yet God planted it in the open air; and the man who argues that it must be kept in this latitude in the same manner, on that account, must be a valuable instructor. The bee, located by Nature in the sunny south, is brought by man to a cold region, and with her, all her instincts, which, however well they may serve her in her own home, are found by experience to be unavailable here. Hence the necessity of surrounding

her artificially with what our climate fails to give for a portion of the year.

"Mr. Watson, of Niagara Co., N. Y.," asks a question relative to "frost in the hive," that requires a little serious attention. It shows that he has been along there, and has some experience. Mr. Kinsler's answer to him, indicates his want of the first lesson. This is his reasoning:—"God is the teacher of the bee, and his wisdom cannot err. He has taught the bee on the approach of winter, to close every opening in their hive, except one at the bottom for ingress and egress. Why is this? In order that the heat generated by the natural warmth of their bodies should not escape, but should remain in the upper part of the hive, to furnish them with warmth sufficient for their comfort and convenience. But by boring holes near the top of the hive, this design of the Creator is frustrated. The warm air, by its lightness, rises to the top of the hive, and escaping through the holes, leaves the interior of the hives nearly as cold as the external air, and thus the ingenuity of man deprives the bees in a great measure of that genial warmth which the wisdom of their Maker has provided for them." Now, I deny that he proves any such design! He first assumes a fact that is not a fact, when he says the "bees close every opening except the one at the bottom." Where is the evidence that "God designs the entrance at the bottom of the hive?" In the trees of the forest, we find quite as many going downward as upward to the hive from the entrance. In hives of man's construction, it is common to make entrances only at the bottom; but this proves nothing of what is natural. Now, it happens that I have had entrances near the top in two or three scores of hives, since I have kept bees, which have been as prosperous as any, and never yet had the entrance of one of them closed up! Mr. Kinsler is not the first man that has got in a swamp by theorizing in relation to bees. Again, Mr. K. says:—"But the current of air occasioned by boring holes in or near the top of the hive, carries off a large portion of this moisture, and thus deprives the bees of another source of health, which their kind Creator had intended for them." If he had had experience on this point, he would, like the rest of us, have discovered the combs ruined by confining this "moisture," by just such methods as he recommends, and see the necessity of getting rid of it, by boring holes, inverting the hive, or any other way. I deny that this moisture is essential to their health as a drink.

Again,—"The Author of Nature has taken good care to defend all animals intended for cold climates, against the severity of the winter." This, of course, we will not deny in many cases. But I hope he will excuse us if we object to admitting that the bee was intended for a cold climate, on that account. One extract more. "The gentleman from St. Johnsville has done the subject of Bee-Culture serious injustice, by publishing so extensively his theories, advising all to treat their bees in so unfeeling and shameful a manner." This is a sweeping assertion, and at present lacks the necessary proof. Wintering bees in this manner, is "theory," is it? I think I am safe in saying it is past that. I will guarantee that I can show ten, if not one hundred stocks, that have been successfully wintered the last winter on this plan, where Mr. K. can produce one wintered successfully by the method recommended by him. The desire to make known my method of wintering, and management generally, may be a weakness. It probably arose through self-esteem, egotism, perhaps conceit. I had kept bees thirty years, and had been quite successful—call it lucky, if it suits better—the number of stocks gradually increased till I now manage some 800 colonies, and they are subjected (except what are in the movable frame hives,) to this "shameful and unnatural treatment." My success having been pretty uniform, and my stocks increasing beyond any that I have heard of in this State, or any other of the States, I felt vain enough to offer some advice. I did it well knowing what I said, especially with respect to wintering. This was offered gratis, as advice to promote bee-culture. Suppose no one chooses to profit by it, I shall not cry over it, or make myself very uncomfortable, even if some prefer to go to that "dear school," so necessary for those that can learn in no other.

St. Johnsville, N. Y., 1859. M. QUINBY.

THE WIRE WORM—POTATO GROWING, &c.

EDS. RURAL:—In the RURAL of May 14th I notice an inquiry from O. SACKETT, for a remedy for wire worm in his potatoes. I can recommend salt as an effectual preventive against their ravages. I always use it plentifully in the hill or drill at the time of planting, and never, to my recollection, have my potatoes suffered, though corn planted in the same field has been badly injured. If used alone I should say from 2½ to 3 bushels per acre, but it is better applied composted with other special manures, and for the benefit of my brother farmers, I will give you my recipe for increasing the quantity and quality of potatoes, and preventing the rot.

For my early potatoes I mix all my hen manure, collected under cover through the year, amounting to from 4 to 6 barrels, with 1 barrel fine salt, and 5 bushels plaster. Apply to the drills by strewing it along from the hand, walking about as fast as for ordinary sowing. This amount of manure, so applied, will do for 1½ to 2 acres. For the main crop, I take 10 bushels fresh lime, 10 bushels fine salt, (or 2 barrels,) 20 bushels unleached wood ashes, 5 bushels plaster. Make a bed of the ashes as for mortar, mixing the lime and salt in the centre, then pour on water enough to slake it, covering it over with the ashes, and plaster on the top.

If there is time for this mixture to stand for two or three weeks or more it is much better, so that the chloride of calcium formed by the union of the lime and salt, can be perfectly composed. It, however, as is often the case, the making of this manure is delayed from forgetfulness, I let it stand for two or three days until the whole mass is thoroughly slaked and heated up, then mix well together, and apply in drills as before stated, or, if in hills, put a good handful in, draw a little dirt over it, then put on the seed, and cover, and I guarantee the good results will be seen from the time the potatoes are first up, till the time for planting comes around again.

The above are the proportions I use. I can't

exactly say how much land this amount will serve for, but certainly two or three acres—and any that is left over will do well to sow broadcast and drag in for some of those small experimental patches of carrots, beets, turnips, &c., &c., which all we readers of the RURAL who have never grown any before, intend this year, I hope, to put in.

For the fly which Mr. SACKETT states is destroying his turnips, cabbages, &c., I should recommend a liberal dusting of soot, ashes, plaster, tobacco dust, or something of that sort, as a preventive.

I had a word or two to say respecting Mr. Logan's system of brush draining, mentioned in RURAL of April 30th, but must wait another opportunity, thinking this communication enough of an endurance for yourself and readers for once.

Aubrey Farm, Fayette, N. Y. W. W. STACEY.

WICKS' ATMOSPHERIC CHURN.

In the RURAL of April 2d, we gave an extract from an article by H. A. COOK, of Columbia Co., which spoke of using a four-minute churn. Its publication soon brought us a large number of inquiries, and in our issue of the 30th ult., (under the head of "That Four-minute Churn,") we stated that we could neither answer the queries nor give the address of Mr. Cook, but presumed some of our friends would be long favor RURAL readers with definite information on the subject. Only a day or two after the last-named paragraph was published, we casually met (in Arcade Hall,) an Agent of Wicks' Atmospheric Churn, and learning, on inquiry, that he was from Washington County—that it had been introduced into Columbia—and that it was a "four-minute churn"—we surmised that perhaps this was the identical churn alluded to by Mr. Cook, about which we had received so many inquiries, and resolved to ascertain in regard to its operation and merits. The gentlemanly and apparently very candid agent, Mr. N. BROWNELL, promised us an early opportunity to witness the operation and speed of the churn, and we have, within the past ten days, been present at four trials of its capacity, at different places. Three of these were made one day last week, in the town of Gates, a few miles west of Rochester, and subsequently one in this city.

The first three trials were made at as many different farm houses. On the first trial, cold cream was used, in the open air on the north side of the house, the morning being quite cool. The churning was completed in between ten and twelve minutes, notwithstanding the unfavorable circumstances. The second trial was made with cream at a temperature of about 60 degrees, in a warm room; time 9 minutes. The third trial was made in a warm room, with the cream at a temperature of 63 to 64 degrees, and the churning was completed in four and a half minutes. Butter was produced in four minutes, in this instance, but the churn was not stopped until the work was complete—4½ minutes. These experiments were witnessed by several gentlemen conversant with butter-making, all of whom, we believe, were satisfied that the churn would produce butter within five minutes, at any time, with the cream at a proper temperature—say from 62 to 64 degrees Fah. The cream was not measured in these trials, but from eight to twelve pounds of butter were made at each churning. We witnessed another experiment with the same churn, (at the National Hotel, in this city,) on Monday of this week, when butter was produced in from four to four and a half minutes.

Such is the result of our investigations—and it may be proper to add that we handled the thermometer in the two last experiments, carefully noting the temperature, and also timed each churning by the watch. We have been bored by a great many agents of patent churns, bee-hives, &c., and examined scores of such inventions which we considered unworthy of the least notice; but in this instance we set about the matter voluntarily—perhaps bored the agent—and, though not prepared to cry "Eureka," we are satisfied that Wicks' Improved Atmospheric Churn is a decided acquisition, if not the long-sought desideratum. We are assured that it has completed a churning in one minute and a-half, and often in three minutes, but if it will do the work in five minutes—or even inside of ten—it is a great and valuable improvement. In this belief we confidently commend it to the attention and examination of the large number of our readers interested. To enable them to understand its construction and operation we subjoin the following cuts and description, as furnished by the agent:

"In the figures, A represents the body of the churn; C, C, represents uprights on the top D, D, which support the shaft B, on which is secured the driving wheel E, said wheel E, being provided on its side with teeth or cogs which work in a bevel wheel F, on shaft G, which serves to drive said shaft; G, represents a vertical shaft which is provided near its top with the bevel wheel F, and which has a bearing in the center of the bottom of the churn, for its lower end; this shaft passes through two pieces, I, I, at their junction, said pieces crossing each other at right angles, are secured near the bottom of the shaft G, to said shaft; J, J, J, represent four tubes, the lower ends of which are secured in openings in, or near the extremities of

the cross pieces I, I, the upper ends of said tubes being secured around the shaft G, near its top, under the wheel F; funnels are secured in the sides of the cross pieces as represented, near their extremities, in such manner that they will communicate with the bottoms or lower ends of the tubes J, J, J, D, D, represent openings in the top of the churn, which are covered with gauze wire as shown.

"This churn is operated, when the parts are all in proper position, by turning the crank, which gives motion to shaft B, and wheel E; this communicating a rotary motion to the shaft G, and its attachments in a direction which will keep the mouths of the funnels constantly receding from the cream; as the funnels recede from the cream or milk, a vacuum is produced in the tubes J, J, J, and the external air rushes in immediately at the tops of the tubes, and is conveyed through them to the bottom of the churn, where it escapes and rises through the cream to the top of the churn again. As the lower ends of the tubes move much faster than the upper ends, the equilibrium is destroyed, and the air rushes into the tubes much faster than it would if the tops and bottoms moved at the same speed. When the shaft G, is turned rapidly, the cream in the churn assumes the shape of a hollow frustrum of a cone, and is kept between the sides of the box and the circle or cone described, by the revolving of tubes J, J, while the butter when it begins to come, being heavier than the cream, falls between the tubes J, J, and keeps between these tubes at the bottom of the churn. The object of the gauze wire covering for the apertures D, D, is, 1st, To give ventilation, and in the 2d place, it affords an opportunity of examining the condition of the cream while the operation is going on. 3d, It prevents spattering. It is often necessary during the process of churning, to examine the condition of the cream, to note its changes, so as to know how to treat it properly, and this cannot be done in ordinary churns without taking off the top, which always produces a bad effect upon the cream in a more or less degree."

This Churn has been thoroughly tested, during the past month, in Washington County. The Washington Co. Post of the 8th ult., in speaking of the churn and a public trial of its capacity, says:—"The first operation was that of churning about four gallons of cream, which, according to our time, (and we timed it,) and the time of several other watches present, was performed in three minutes from the first stroke, and produced from 16 to 19 pounds of butter. The next operation was the churning of about the same quantity of milk,—milked the night previous, though still sweet,—which was executed in five minutes. These facts we state on our own knowledge, and hold ourselves responsible for their truth."

The same paper of the 16th ult. says:—"We had the pleasure of again witnessing an operation of the Atmospheric Churn on Tuesday last. There were about five and a half gallons of cream in the churn, and although the quantity was a little greater than should be churned at one time in that sized churn, yet the churning occupied just three minutes by the watch, and the amount of butter, which was weighed by our own hands, was 35 lbs. before the milk had been fully worked out of it. The butter, after being fully worked, would weigh about 33 lbs. Several gentlemen were also present to witness the operation,—among them our friends D. VOLKSTINE and Mr. STOCKWELL, of Aurora, Ill. All present seemed perfectly satisfied with the success of the experiment."

The Churn above described was patented by L. J. WICKS, of Racine, Wis., in March last, but the patent is now owned by E. JUDSON, of Cambridge, Wash. Co., N. Y., and S. JUDSON, of Racine, Wis.

SALE OF S. T. TABER'S SHORT-HORN HERD.

EDS. RURAL:—The sale of Mr. TABER's fine herd of Short-horns came off to-day, (at Dover Plains, Dutchess Co., N. Y.,) and I give you the results of the sale. The day has been a most unfavorable one—a cold, north-east rain storm preventing, doubtless, many from attending. There was a fair attendance, mostly from Dutchess county. The best bidders, however, were from New England, and they bought the best animals. Ten Bulls and twenty-four Cows and Heifers were sold. The stock was in fair condition; the sale was conducted as such sales should be—every animal put up and sold to actual purchasers without a single by-bidder. Only one animal had a reserved price upon it. Mr. TABER requested this privilege as the last animal was brought into the ring, his stock bull "Highflyer," a very superior bull—sired by "Duke of Gloster," (now owned by JAMES O. SHELTON, of Geneva,) his dam imported "Diana Gwynne." He was five years old, in fine condition; his stock on sale showed him a capital stock getter. He was started at \$450 and realized \$505, and went to Massachusetts. I regretted he had not been retained in New York. He cost Mr. TABER, when 6 months old, \$600—and was a bargain, I think, at a much higher figure now.

I give you a list of the animals, and the purchasers and prices, as well as they could be ascertained. Taking notes in the field, with the thermometer at 40° or thereabouts, and the north-east wind making it good for 10 degrees more of cold, was not the most favorable for work. I give you, however, as understood at the time, and presume the list is correct as to the prices, and as to purchasers substantially so. There were ten Bulls sold at an average of \$121.20 each, all but four yearlings—one 9 months. Twenty-four Cows and

Heifers at an average of \$114. The Bulls brought \$1,312, and the Cows and Heifers \$2,736. Total, \$3,948. Had the weather been favorable I think the attendance would have been such as to have secured a considerable advance in the prices of the best animals.

Rural Spirit of the Press.

A Hint to take Now.

WHITE WALLS, and long lines of white fences, gleaming amid luxuriant and embowering foliage, give to a farm establishment an appearance of neatness and rural elegance and comfort, indescribably attractive to the man of taste, and can in no way be so effectually and economically secured as by giving them a few coats of whitewash. The whitewashing of cattle and horse stalls, as well as inside of hog cotes and heneries, not only renders them more healthy, but prevents the animals and fowls from being infested with troublesome, filthy vermin.

How to Wash Sheep.

One of the correspondents of the Wool Grower, H. H. ROBINSON, of Millersburg, O., gives the following as his mode of Washing Sheep:—"Take a large sized stone box and place it below a mill-dam or on a rivulet where you can have a stream of water running in it through a spout. The way to manage the sheep is this: turn the sheep on its back, let one person take hold of its fore legs with his left hand, and hold of the back of its head with the right, and another person hold the hind legs, and in that manner dip the sheep in the box of water a few times, then let the sheep turn on its feet in the box and press the wool until it becomes clean. I like this way of washing much better than the old way of dragging sheep into a stream and worrying them about until the wool is clean."

Sowing Peas.

S. R. ELLIOTT, of Cleveland, writing to the American Farmer Magazine, says:—"Some years since, I commenced sowing peas, and covering them at different depths, varying from one inch to one foot. I found those buried eight inches deep appeared above the ground only one day later than those buried only two inches; while those that were covered twelve inches deep were a little over two days behind. As they grew no perceptible difference was noticed, until they commenced blossoming and setting, then the advantage of the deep planting exhibited itself; for those that were eight and ten inches deep continued to grow, blossom, and set pods long after those only two to four inches commenced ripening and decaying. If the soil is light and loamy, I will hereafter plant my peas eight to ten inches deep; if the soil is clayey, I would plant six inches. I never earth up, but leave the ground as level as possible."

Save the Soot.

We clip the following from the Maine Temperance Journal:—"This, though generally thrown into the street and wasted, is one of the best manures. It is extensively used in England, and when only fifteen or twenty bushels are applied to the acre, it induces the most luxuriant crops of wheat and other grains. It contains, in small compass, almost all the ingredients of coal or wood used for fuel. It also contains the several salts of ammonia, magnesia, lime and muriatic acid. Its components are the natural food or stimulants of plants, and it can be used to great advantage as a concentrated fertilizer to stimulate germinating seeds in the drill. It is not only sown broadcast with the grain, but it is applied to the root crops with the best results. Potatoes and carrots especially are benefited by it. Six quarts of soot to a large hog-head of water make an excellent liquid manure for the garden. It can be applied with safety to all garden crops, and will pay well for saving."

On Sowing Plaster.

A CORRESPONDENT of the Agricultural describing this process, says:—"When your land is tolerably free from obstructions, not too hilly, and dry enough in spring for a wheel carriage to pass over it without damaging the clover, rise with the sun, or a little before it, on a still morning; take a cart, (as it is better to turn than a wagon,) put a barrel of plaster in the fore end of it, and a shovel to fill with; fix a box or tub close by the tail-board of the cart, about the height of your knees, and an old chair or seat in front of it. Fill your tub, take your seat, turn your boy to drive on, and commence sowing over the tail of the cart with both hands, just as you would do if walking and carrying the article, the difference being that, instead of walking into the dust, you are riding away from it, and by being elevated, can sow a wider cast; instead of having to go across an acre several times, while sowing it, to get your mouth, nose and eyes filled with dust, you may be as clean as when you began, except a little scattered upon your trousers; when the wind rises, quit, and you will do more in one morning than in half a day by the old method."

Agricultural Miscellany.

GRAIN AND PRODUCE.—Great Advance in Prices.—It will be observed by reference to our Market Reports that prices of Breadstuffs, Produce, &c., have taken an astonishing leap during the past week. Flour and Grain are especially elevated, with an "Excelsior" (still higher) tendency, while Potatoes and Pork participate in the upward movement. Our dealers are more excited and feverish than we have known for many years, and some of the shrewdest anticipate a still further and continued advance—predicating their opinions upon the last foreign advices, including the declaration of war by three great Powers, and the supposition that they are short of Provisions. What the result will be time alone can determine. Though we are inclined to look upon the sudden advance, and speculative feeling and action, as the temporary result of excitement caused by the foreign news, and the anticipated European demand for our Breadstuffs, we are yet of the opinion that a permanent advance of prices may be maintained. This, however, must depend upon circumstances and contingencies, and we are inclined to the belief that producers who now have anything to sell would do well to take advantage of the high prices which now rule. As to the future, each farmer should carefully note the market reports and foreign news, and act upon his own judgment.

THE WHEAT CROP.—Our accounts, by letter and otherwise, from the wheat growing sections of the Union, generally speak in the most encouraging terms of the appearance and prospects of the crop. Correspondents in Ohio, Michigan, Illinois, and other parts of the West, report very favorably, and concur in the opinion that, extraordinary and contingencies excepted, the wheat crop of 1859 will prove the best harvested for years. We rejoice with them in the prospect, and trust that the crop will escape injury or destruction by the oncoming and contingencies to which it is liable. A good wheat crop, now, will tell upon the individual prosperity of the growers, and immensely benefit the country.

PREPARING GROUND FOR CORN.—A Michigan correspondent of the Tribune produces great crops of grass by using plaster. For corn, he plows in clover and in the fall, and applies all his manure to it in the Spring, working it in thoroughly with the cultivator and harrow. "Hoing the corn fits the ground well for wheat, and I sow it as soon as the ripening of the corn will admit. After the wheat comes off, I plow in the stubble in the fall, for oats, with timothy and clover in the Spring. In this way I get three crops of grain (one of them wheat) in three years, and get the land back to clover in the time. Last year my corn yielded 100 bushels of ears per acre, and the wheat this year, on the same ground, averaged 14 bushels per acre, though it was badly shrunk. These crops were raised on land which was thought nearly barren when it came into my possession."

A HAPPY AND "LUCKY" SHEPHERD.—In a recent letter, GEO. W. KENDALL, formerly editor (and still co-proprietor) of the New Orleans Picayune, who has for several years lived upon his great sheep ranch, near New Braunfels, Texas, writes thus glowingly to a friend in Boston:—"I have now five thousand sheep, and all fine stock. Have realized over seventy-five per cent profit per annum on the investment since I have been here, which will do for hard times. Flocks now in healthier and finer condition than ever. My good luck has now lasted three years without intermission. I went to New Orleans last Christmas time, with my wife and oldest girl; was gone six weeks, which was quite long enough. I wouldn't live in a city if you would give me one. I am in the enjoyment of the very best health, and am now ten years younger than I was ten years ago."

GRUBS IN SHEEP.—A writer in the Mich. Farmer says this is a perfect cure for grubs in the head of sheep:—"Take one quart of whiskey and two ounces of yellow snuff; mix and warm to blood heat. Let one man hold the sheep and another take a small syringe and discharge about a teaspoonful of the mixture into each nostril. It is a certain cure. My father met with quite a loss in his flock; he tried this remedy, found it satisfactory, and never lost another sheep."

THE HOG CHOLERA, which has made such fearful ravages in Kentucky for a year or more, has broken out in Central Illinois, and is making sad havoc among the swine. One day, recently, two men in Sangamon Co., lost one hundred and thirty-five head, and another over seventy head. Within two weeks another person lost two hundred head, while many others have lost more or less.

THE ANNUAL HORSE SHOW of the Monroe Co. Ag. Society is to be held on the Fair grounds, near this city, on the 4th of July ensuing. The list of premiums (amounting to over \$300,) regulations, &c., will soon be published.

THE ORLEANS CO. HORSE SHOW is to take place on the Society's Grounds, in Albion, on the 2d and 3d days of June. The arrangements are on a liberal scale, and a successful exhibition is anticipated.

THE LOST TOWN FAIR (Seneca Co.) is to be held June 8th. Opportunity is offered for the sale and exchange as well as exhibition of Stock, &c.

THE ANNUAL FAIR of the Berrien Co. (Mich.) Ag. Society will be held at Niles on the 27th, 28th and 29th days of September, 1859.—R. W. LANDON, Sec'y.

THE PALMYRA UNION AG. SOCIETY'S next Annual Fair is to be held Oct. 11th, 12th and 18th.

THE AGRICULTURAL PRESS.—The following paragraph from the Journal of the California State Agricultural Society contains some facts worthy of notice,—and of reflection as to what the same Power (the Agricultural Press and Literature,) rightly directed, may accomplish within the next thirty years:

"Few persons appreciate the benefits of a well-conducted Agricultural Journal to the country whose resources it is designed to develop. The cant phrase, 'instructed with a snail,' 'book farming,' is still sufficiently prevalent to show that Agricultural Literature has not yet accomplished its work. Still it has done much, and its successes annually multiply. Forty years ago, and the 'American Farmer,' published at Baltimore, under the auspices of John B. Skinner, was in embryo, its maturity and real birth being on the 2d of April following. In August, 1822, Thos. G. Fessenden, of Boston, issued the first number of The New England Farmer, also a weekly, and not long afterward Mr. Samuel Fleet commenced The New York Farmer and Horticultural Review. These were all the agricultural journals in existence thirty years ago. Even as late as 1850, the influence of the Press, and the Agricultural Press and Literature, rightly directed, may accomplish within the next thirty years:—

HORTICULTURAL

NOTES IN THE FLOWER GARDEN.

In our last notes we were compelled for want of space to omit mention of the Bulbous rooted flowers. Previous to that we had described the Snow Drop and the Crocus.

HYACINTHS.

The season was quite favorable for Hyacinths, and our show was exceedingly fine. Among the best we note the following:—*Baron Thuyll*—a large compact truss, violet blue. This is one of the finest of the color. *Amiable Brunette*—dark blue. *Belle Blanche*—large compact spike, white. *Gen. Antink*—double—light blue. *Mars*—single red, striped with white, very showy and beautiful. *Diebitch*—the finest red. *Belle Corina*—pink, striped with red; one of the best fancy sorts. *La Dams*—double white, truss good. *Candide Viola*—white, very double, large bells and good large spike; one of the best of the light double. *Grooteoort*—double bluish, fine large truss; every way desirable. *L'Amie Du Cœur*—pink, and one of the very best of the color; fine truss. *Virgo*—double, white, tinged with blue; long fine truss. We find a long list in our note-book, but the above twelve sorts will be sufficient, as we wish to give a few useful hints in regard to culture, &c.

One reason why the Hyacinth has not been more generally cultivated by ladies, who always love flowers, and even under the most unfavorable circumstances, manage to grow a few, and by those who have but little time and means to devote to gardening, is the fact that the directions given by European and even American writers, have been so formidable as to discourage, if not confuse. The cultivator is generally told to remove the common soil two feet or more deep, and fill up with clean sand and well rotted cow manure. Now this is well enough, if flowers were to be grown for exhibition, but good hyacinths may be raised in any ordinary loamy soil. If the garden soil is heavy clay then remove a portion, and add good sandy loam from the woods.

The latter part of October is the best time to make Hyacinth beds, which should be from three to four feet wide. Set the bulbs from six to eight inches apart each way, and four inches deep. It is a good plan to surround the bulb, when setting, with a little clean sand. Before winter sets in cover the bed with leaves, or a little straw or litter.

In about five or six weeks after flowering, when the leaves are dead, the bulbs may be taken up, dried and packed away in paper for fall planting. If the bed is wanted for other flowers, they may be removed in three weeks after flowering, the flower stem cut off, and the bulbs laid on a dry bed and covered with a little earth until the leaves have ripened, when they should be packed away as before recommended.

Many persons ordering Hyacinths from the seedsmen and nurserymen entertain the idea that none but the double ones are desirable. This is not the case. The value of this flower depends principally upon the form of the spike and the arrangement of the single flowers or bells upon the flower-stem. The truss of bloom or spike should be pyramidal, and the flowers close enough to entirely conceal the stalk.

THE NARCISSUS.

Flowering with the Hyacinth we have the Narcissus family, including the well-known *Daffodil*, and *Jonquil*. They are mostly perfectly hardy, should be planted in the autumn like the Hyacinth but may remain in the ground a number of years and until they become so thick and matted as to make a division of the roots necessary. Some of them are double, and are very showy, but the single sorts are more delicate and prettier. The *Early Double Daffodil* is of a bright yellow. *Incomparable Pleno* very double, light yellow or straw color, intermixed with dark yellow, or orange.

The engraving will give a very good idea of the form of the single flowers, and the central cup, which being of a different color from the six petals, makes these flowers exceedingly attractive. Some have the petals of a light yellow, and the cup orange, others with the petals white and the cup yellow, while the *Poet's Narcissus*, sometimes called *Pheasant's Eye*, is snowy white, the cups cream color with a delicate fringed edge of red, which gives it latter name. Then there are some varieties with the cups very large and long, in the form of a trumpet. One of the best of these is called the *Sulphur Trumpet*, with the cup or trumpet nearly two inches in length and broad at the extremity.

The most beautiful class of the Narcissus family,

however, is the *Pollanthus Narcissus*. The flowers are produced in clusters or trusses of from half a dozen to three times this number. Like the others they show every shade of color from the purest imaginable white to deep orange; the cup of the white varieties being yellow, and of the yellow sorts orange. These are not as hardy as the other varieties, but are sufficiently so for general culture in this latitude in a well drained soil.

In our next we will give a few suggestions on Tulips and their culture.

THE SEASON.

The weather for the past week or two has been remarkably fine, and vegetation has made rapid progress. The prospects at present are that we shall have an abundant crop of all fruits except peaches.

ANNUALS may still be sown, but there is now no time for delay. About the first of June, BEDDING PLANTS should be put out, and they are among the most useful ornaments of the flower garden, particularly valuable in beautifying new grounds, or filling beds where bulbs have flowered. Those who live near a green-house can obtain them conveniently and cheap, and they can be safely sent by express almost any distance. Our advertising columns no doubt will tell where they can be obtained. In the next number we will describe a few of the best.

CANKER WORMS.

For two years past the apple orchards in this vicinity have suffered extremely from the visits of millions of caterpillars, which we cannot fully identify with any variety described in either Hannan's or Fitch's works, though they are undoubtedly a variety of *canker worm*. They make their appearance with the first leaves, in the early part of May, being quite small when first seen, and continue until the middle or latter part of June, increasing in size, until they are from an inch to an inch and a half in length. At first they are scarcely noticed, as they form no web, but cluster together on the tops of the branches. In a short time, however, they become so large and so numerous, and create such havoc among the trees, destroying every leaf within their reach, that the farmer becomes alarmed for the safety of his orchard, and all the available strength is immediately set to work to kill these destructive enemies.

It was only last season that our attention was particularly called to these caterpillars, and the present year they bid fair to be more numerous than ever in many orchards. The largest are now about one inch in length. They have fourteen legs, eight behind and six before, and crawl along, not moving like the inch-worm. The belly is of dullish yellow, there is a very fine line of white, a stripe of ashy blue, above which is a fine line of yellow. The back is black, ornamented with nine white spots. The head and other extremity is of a bluish ash. When disturbed, they fall from the limb and hang suspended by a single web.

It will be well for our readers to examine their trees for these insects—for if permitted to take their course for one season, where numerous, they will not only destroy every leaf, and of course the present crop, but do the trees permanent injury. We know of persons whose orchards were fairly overrun with them before they were aware of it.

THE ALLEN RASPBERRY.

Two years ago, L. F. ALLEN advertised two varieties of "hardy Raspberries." I had already several kinds that needed winter protection, and felt, like many others I suppose, quite willing to get rid of putting down the canes every winter to save them. I sent for a dozen each of these varieties of Mr. ALLEN. Of one I obtained only about a half dozen, but the other made up the deficiency, and I should have lost nothing if it had made up the whole. They produced fine canes and a few berries the first season, and last year I had probably a fair test of the fruit by the side of the *Yellow Antwerp*, *Festoff*, *Francia*, and others. One variety will compare favorably with either of the others, and when we take into consideration its hardiness, it must be superior; having stood unprotected, without apparent injury, two winters. The other and inferior variety, in color, is half way between the wild red, and black, but larger than either, and a very poor bearer. The canes, like the berries, appear like a cross between the red and black, not bending over quite as much as the black, nor as upright as the red, very branching and quite liable to be broken with snow. The color of the canes is also on the same principle, darker than the red, &c.

Now, if any one has only one variety of this *Allen Raspberry*, (I suppose the name applies equally to both,) and that should happen to be the darker one, I think there would be some grounds of complaint; but with the other kind I think the complaint would depend on disposition. As for myself, I am well satisfied so far with the one, but shall dig up and throw away the other.

St. Johnsville, N. Y., 1859. M. QUENBY.

PRUNING DWARF PEAR TREES.

MESSRS. EDITORS:—In response to a vast number of inquiries, from interested persons, as to my mode of *Pruning Dwarf Pear Trees*, with your permission I will give some specific directions in reference thereto, which, if well followed, it is believed will enable persons without practical experience, to wholly avoid the principal cause of a large share of the failures with dwarfs, viz.:—a want of thorough pruning.

Experience has convinced me, that with good trees, of well chosen varieties, on any good corn land, which is never too wet; and with the culture a good farmer gives his other crops; and the important—nay, more, the indispensable requisite to success—thorough pruning, no one need fail of attaining a degree of success highly satisfactory and profitable.

A Dwarf Pear Tree should never be planted at one year old. A good one year old tree consists of a single upright shoot or stem, from three and one-half to five feet high, and should be cut off at about two feet from the ground; and in order to give a

smooth handsome stem or trunk, let the buds be rubbed off, to the height of one foot from the ground—leaving on the upper portion six to nine buds, more or less; with the tree standing in its original position, in full vigor, and cut back as above stated, each one of these buds will throw out a good strong branch, which gives a full round distaff form to the tree; and is the time and manner, and the only time, when that desirable shape can be given, on which the future form of symmetry and beauty, so much depends; and to avoid what is termed a crotched or forked-top tree in which the two uppermost branches are about of equal vigor and height, let the second branch from the top be pinched off, when about nine inches or a foot long, which will check and weaken it, while the uppermost one becomes a strong central leader. Whereas, if the tree be transplanted at one year old, and cut back as above stated, the vital forces of the tree will be weakened half or three-fourths by transplanting, and, as the result, only two or three, (more or less,) of the buds on the trunk will grow so as to form branches; and they perhaps only at the top or all on one side, while the remaining buds remain dormant, never afterwards to be developed, as the other branches form new channels, which will more readily carry the sap to other and upper portions of the tree.

For transplanting, therefore, let a tree be two years old from the bud, well cut back at one year old, and with six to nine main branches, which form the frame-work, or foundation, which is to give form and character to the future tree, with proper care and management.

FIG. 1.—DWARF PEAR TWO YEARS OLD.

The annexed cut, figure 1, will illustrate a two year old tree, as above described, its lower branches about one foot from the ground, and its upper branches being the strongest and most upright, and those below less vigorous and more horizontal.

I speak of this more particularly for the reason that all the cuts which I have noticed in works on Pomology, and in agricultural papers, represent a two year old tree, with branches much the longest, and strongest, at the bottom; and diminishing in vigor towards the top, except perhaps the center top branch; while all experience illustrates the principle that the sap flows most freely and readily to the upper branches, giving them vigor, strength and uprightness to the diminution of the same characteristics in those below.

The dotted lines indicate where the branches should be cut back at the time of planting.

FIG. 2.—DWARF PEAR THREE YEARS.

In cutting a tree, with branches formed as above described, let the leader be cut down within four to six inches of the place where the one year old tree was cut off, and just above a good bud on the side of the tree over the previous year's cut, thus keeping the leader in a perpendicular position over the original trunk or bottom of the tree.

If the side branches are too horizontal, an upper bud is left for its extension; if too upright, a lower bud is left. Side direction may be given, if desirable, to fill wide spaces, in the same way.

Cut the other branches at such a distance from the trunk, that the ends of all of them would form a pyramid, the base of which should not be over twelve to sixteen inches in diameter, and in smallish trees much less; thus the lowest branches will be left the longest; the object of which is to check the natural flow of sap to the upper branches, and induce it to flow more forcibly to the lower ones, increasing the vigor and force of the latter as much as possible, which must be done at that time or never.

Figure 2 represents a three year old tree after it has been pruned at two years old, and made the third year's growth, and showing where it should be cut back at that time. All subsequent pruning will become easy to any one who has attended to these directions thus far—observing the same principles, thinning out or cutting back any secondary, or other branches, as shall seem to be necessary to admit light and air, or give vigor or symmetry of form to the tree, but as the greatest force of sap will flow to the central and upright branches, they will need to be cut back most, retaining as near as may be the pyramid form; ever bearing in mind this fact, that no one prunes too much; and, after having pruned well and gathered rich harvests of luscious pears, if you still wish to grow them larger and better than ever before, prune a little closer, and that result will certainly be attained, and the vigor, beauty and longevity of your trees will be increased thereby.

T. G. XENOMAS.

Walworth, Wayne Co., N. Y., 1859.

ORCHARDS IN CANADA.

In the Canadian *Agriculturist*, Mr. Geo. Leslie gives an interesting history of fruit culture in Canada West:—"Twenty years ago," he says, "the few scattered cherries consisted of sour kinds, commonly called Kentish, with sometimes a few scattered May Dukes and Ox Hearts. Our plums consisted of common and yellow, with a few Egg and Green Gage. Few people had ever heard of the fine varieties that have been introduced within the last fourteen years, such as Bolmar's Washington, Jefferson, Duane's Purple, Imperial Gage, &c. The only distinction then was, wild plums and tame plums. Of pears, there were none, and they are still scarce, and a great rarity in our markets. These remarks apply to the common practice only; there were here and there worthy exceptions, of individuals who in the face of great difficulties which have now happily disappeared, had collected many of the improved varieties which even now stand among our esteemed sorts; such as, for instance, among apples, the Fameuse, Pomme Gris, Bourassa, Baldwin, R. I. Greening, E. Harvest, &c. Last year our fruit crop was rather a failure, but in the fall of 1855 I was very much pleased to see a few barrels of fine specimens of the following sorts, grown in the neighborhood of Toronto, offered for sale in our markets, namely:—Fall Pippin, Esopus, Spitzenburg, Yellow Belle-fleur, Baldwin, Roxbury Russet, St. Lawrence, Ribston Pippin, &c., &c., and from the number of the trees planted of late years, we expect to see in our market a few more of the best sorts, for commerce and transportation.

"As far as my knowledge extends, the following list of apples comprises some among the best and most suitable varieties adapted to our climate:—*Summer Varieties*.—The Early Harvest, Summer Queen, Early Strawberry, Sweet Bough, Duchess of Oldenburgh, Red Astrachan. *Fall Varieties*.—Fall Pippin, St. Lawrence, Fameuse, Twenty Ounce, Ribston Pippin, Porter. *Winter Varieties*.—Rhode Island Greening, Baldwin, American Golden Russet, Pome Gris, Roxbury Russet, White Belle-fleur, Esopus Spitzenburg, Newtown Pippin, Belmont, Swaar, Northern Spy, Dutch Mignonne.

Inquiries and Answers.

THE APPLE WORM, &c.—I have been but a short time a subscriber and reader of your valuable paper, but this short time has shown me—I am not mistaken—that your subscribers ask many questions, as well as help you answer the many inquiries weekly made of you. Permit me, then, to follow the example of the first mentioned, by asking questions, the answers to which I think may be of benefit to many beside myself. May I look for an answer in your next issue?

1st. I have a very fine Baldwin apple tree standing in my garden. Soil, clayey loam, clay subsoil. Tree some fifteen inches through in trunk, and in most vigorous health. It blows full, the apple forms, but most of them fall while quite small, and the very few that do not are wormy, rotten, poor things, and last fall there were but two of this sort. I pruned the tree well, and also pruned one of the large roots. Not in a very scientific way, for my garden was made, and not wishing to disturb it cut close to the trunk of the tree, my purpose being to stop the great flow of sap. The tree is shielded on the north by brick wall. I am told I need not raise apples on the soil we have here, but without much reason, I think. All the while the ax has been near its roots more than once, I have given it a reprieve of one year more, it is such a splendid-looking tree, capable of bearing many bushels. Can you tell me what it wants?

2d. Is it well to train a grape vine on a brick wall, or better to put a trellis a short distance from the wall? If so, what distance, and what is the best cheap trellis?

3d. I see much said in the *Tribune's* reports of the Farmers' Club of the mixture of lime, slaked with water, saturated with salt, (three bushels lime to one of salt,) letting it stand until the light powder shows itself on the outside of the pile, which is the valuable part, if I understand it, for top dressing, &c. Is it equally good for all kinds of grain and grass growing on all kinds of soil? If better for one than another, will you let us know which, and what quantity and time to apply? Will it pay, lime and salt, at one shilling a bushel? Give any other information that you may think important about it. I am disposed to use it, as well as salt and plaster, on my farm, and want to make the best application of it.—C. D. D., Syracuse, N. Y., 1859.

1st. THERE is no difficulty, we imagine, either with your soil or tree, but the fruit is destroyed by the *Apple Worm*, which, of late years, has become exceedingly numerous and destructive.

The *Apple Worm* is produced from the egg of the *Coiling Moth*, and this moth is shown, of the natural size, in the engraving (4.) It deposits its eggs in the calyx or eye of the young fruit, during June or July, and the grub is hatched in a few days, and eats its way into the fruit, as seen in the engraving, (1) leaving behind it a brown powder. This grub attains its full growth in a few weeks. Its natural size is shown in engraving (3.) Apples thus affected drop sometimes when they are not more than half grown, others remain on the tree until they acquire a premature ripeness. Few of our readers but must have noticed on trees of early apples, some wormy specimens ripe, while the sound apples were far from being fit to eat. Still others, and particularly winter apples, seem to be less affected by the worm, and hang on the tree.

When the apple falls the grub leaves, eating its way entirely through the apple, as seen in the engraving, coming out at c, and selecting itself a place in some crevice in the bark of the tree, spins a thin white cocoon, shown in the engraving (5,) in which to spend the winter, and comes out the following spring a moth, to commit again its depredations on the fruit, and blast again the hopes of the cultivator. We think many of these worms leave the apples before they fall, particularly those which have taken possession of late varieties. Some think that a portion of them produce a

second generation the same season. We have seen no facts to warrant this belief.

We must say, as we have before, that we know of no patent remedy for this evil—no bomb-shell that will destroy a thousand at a blow. We have always had to fight them singly. In early spring search for the cocoons in the rough bark, the roughest of which may be scraped off. In this way a great many may be destroyed. Also pick up all wormy apples as soon as they fall, and feed them to hogs, or destroy the worms they contain in some other way. Cole says if old cloths are laid in the crotches and around the trees, many will crawl into them to form their cocoons, and may be readily destroyed. We never tried this. We know, however, that if the first two plans are industriously followed, the amount of wormy fruit will be greatly diminished.

2d. A trellis made of posts and wire, and within six inches of the wall, is better than fastening vines directly upon it, as it affords an opportunity for the circulation of air, and the fruit leaves are not pressed against the bricks and injured. Then it is more convenient for training. In Europe, peach, apricot, and other fruit trees, are trained upon walls, but walls made for this purpose contain a portion of wooden blocks cut just the form of the brick. In the wooden bricks, nails can be driven.

3d. We have never found much benefit from the use of salt, except for asparagus; a little, however, will help celery. We would rather receive than give information on this subject. We have heard of a great many experiments on this point, that when traced out amounted to very little as a guide in practice.

PIE PLANT WINE, TOMATO CHOWDER, &c.

EDS. RURAL:—As one of the subscribers of your valuable paper I have (with many others,) derived much benefit from the many recipes in it. I send you the following, which I think may be useful to some of your many readers and, perhaps, new.

PIE PLANT WINE.—Wash and cut the stalks into pieces about two inches long, put these into a stone jar, place the jar in a kettle of cold water and let it remain until it is sufficiently cooked to squeeze the juice from it. To each four quarts of juice add two of water. To each quart (water and juice,) one pound brown sugar mixed well and put into a cask. The cask should be filled and a few quarts left to add up with while in the state of fermentation, at which time the vent should be left open to let off the refuse. When it gets through fermenting it should be corked tight. If kept until spring it should be bottled. This is full as good as current wine, and much less labor.

TOMATO SAUCE.—Seven pounds tomatoes to four pounds sugar; one ounce cinnamon; 1 oz. cloves, and 1 pint vinegar. Boil slowly five hours. This, I think, is excellent.

TOMATO CHOWDER.—To one bushel of green tomatoes add 1 dozen green peppers; 12 common-sized onions; 1 quart of grated horse radish; 1 cup ground mustard; 1 oz. cinnamon; 1 oz. cloves, whole. The tomatoes, onions, and peppers chopped fine. Put the tomatoes and onions in a vessel over night, sprinkle a little salt over them, and in the morning drain the water off, put all together and boil them in clear water until tender, then drain the water from them pack in a jar mixed with the above named spices and pour scalded vinegar over them.

Fond du Lac, Wis., 1859.

HOW TO MAKE BED COMFORTERS.—It may be new to some of the RURAL readers that nice warm bed comforters can be made without the labor of quilting. I have never seen any in the farm-houses in this section made in this way; though "Out West" they are very common—house-keepers there having to be more saving of their time. Take the calico and make up in the usual way; stitch in a frame or, (as I have often done,) lay it on the floor, put in the batting, which may be thicker than if for quilting, if desirable; put the cover on even, pinning or stitching all around, and with a long, slim, sharp darning-needle, and some bright-colored thread or yarn—the eye full—stitch through the quilt, at intervals of three or four inches, in diamonds, &c., all over it, cutting the threads and tying each stitch tight, leaving it a little longer than the stitch. If made from one piece of cloth there is no need of binding the quilt. This is warm and durable if made right—warmer than when quilted.—Mrs. E. M. V., Seneca Co., N. Y., 1859.

BROWN BREAD.—One quart of sweet milk; four cups of Indian meal; 2 cups coarse flour; ½ cup molasses; ½ teaspoonful of soda. Will some of your lady readers please give us a recipe for making Bakers' Gingerbread.—H. N. F., Manhattan, Kansas, 1859.

TO KEEP POTATOES FROM SPROUTING.—To keep potatoes intended for the use of the table from spring until new potatoes grow, take boiling water, pour into a tub, turn in as many potatoes as the water will entirely cover, then pour off all the water, handle the potatoes carefully, laying up in a dry place on boards, only one layer deep, and see if you do not have good potatoes the year round, without hard strings and watery ends caused by growing. The neighbor I got my information from says he has never failed, or had any trouble from rotting or sprouting. Try a few.—Prairie Farmer.

HOW TO MAKE A HOME HAPPY.—Always be cheerful. A dwelling furnished with cheerfulness and cheap furniture will always afford more happiness to the inmates than cushioned sofas and floors, elegant mirrors and mahogany sideboards, with sour looks and ill-temper. Though the elegances of a well-furnished house are not to be despised, they are not alone sufficient to produce happiness. Parents, teach your children cheerfulness, and you will make them happy.

Parting Thoughts at a Sister's Bridal.

By Mrs. S. K. Furman.

O, wave again in the green isles of earth
This sacred embrace may be given,
The quick pulse of joy the pale cheek ne'er may warm
As when loving eyes fondly gazed on thy form,
Or voluble harp chim'd the sweet notes of the soul—
But, O, I would meet thee in heaven.

I had dreamed, O, how fondly, that destiny's hand,
Thro' all of life's changeable day,
Might so guide our steps that one path would be ours,
Though laden with thorns, or besprinkled with flowers;
But another hath won the sweet light of thy smiles
To gladden a home far away.

I would not reflect on thy young bridal heart
The shadows that flit o'er my own,
Nor tinge with forebodings of future alloy,
The beautiful hopes of thy soul's wedded joy—
Thy chaste smile mirrors thy lot all untried
In the paths that but woman hath known.

I'm musing again on the fair autumn eve,
And the room where our pale mother lay,
When the soft golden light through the red maples
gleam'd,
And flush'd the lov'd face that with angel-smiles beam'd,
And the lessons of duty she whispering gave
I would treasure to life's latest day.

She call'd thee her lily-bud, fragile and pure,
As thy bright head reclined on her breast,
Then folding us both in her frail, dying arm,
She bade me so ever to shield thee from harm,
And tenderly pray'd her poor shepherdess lambs
In the All-Father's fold might find rest.

Even so hath it seem'd, O, my brother, who's been
As a joy in our household for years,
Like a bright happy bird that is ever in tune,
Or the warm sunny smile of the rose-tinted June—
Not strange if the peace of her light step to me
Be lonely with shadows and tears.

With blessings untold and unwavering trust,
My sister, to thee, I confide;
There's balm in her heart for each conflict of thine,
And round thee the vine of her sweet faith will twine,
O, see no rude sorrow its green tendrils blast,
But cherish thy fair orphan-bride.

And if, as it may, her tried spirit should fail
Life's trials to bear calm and even,
O, ever, as now, her strong solace still prove,
And each cloud be spann'd with the brow of thy love,
And, more than all, nurse the blest hopes that may
bring
A blissful reunion in heaven.
East Clarkson, N. Y., 1859.

Written for Moore's Rural New-Yorker. WOMAN'S INFLUENCE.

This is a subject on which so much has been said and written that it seems well nigh exhausted, yet how few, even of the female portion of community, realize that they do, or can exert any important influence on the character of society—or give a thought to the subject of that influence, whether it is for good or for evil. Few women have enrolled their names among those of the leading spirits of earth,—man has usually been the instrument in the hand of Omnipotence of building and overthrowing empires and deciding the destinies of nations. To man alone are we indebted for most of those discoveries in science which have so materially altered the aspect of the world, and man must ever continue to be first in all the great events of life. The Creator has so ordered it, and in endowing him with greater strength and superior powers of mental and physical endurance has provided for the fulfillment of his own decree.—True, history tells us of a Semiramis of Assyria, and a Boadicea of ancient Britain, who marched at the head of armies to the battle-field, and led their hosts from victory to victory; and later, Austria has numbered Maria Theresa among the ablest of her sovereigns, and England under none of her rulers has made greater progress in all that conduces to the honor and glory of a nation than under the sway of the indefatigable ELIZABETH.—Russia, too, boasts her CATHERINE, who wielded the sceptre of her gigantic realm with an energy and sagacity worthy of a Nicholas. In literature, also, woman has begun to reap a few of these laurels man has won so long and so proudly. NAPOLEON said of Madame DE STAEL that her pen was a weapon that would hit a man, if he were seated on a rainbow.

Yet all this no more proves that woman's most potent influence has been exerted in public life—or that at the head of nations or armies is the most appropriate place for the exercise of her powers—than that the midnight heavens owe their beauty less to the fixed stars, shining on forever with a dim but changeless light, than to the flaming comet sweeping the skies in its erratic flight, or the brilliant meteor that flashes for an instant and is gone. It is in private life that woman has ever been most powerful, in moulding the characters, strengthening or weakening the energies, and contributing to the happiness or unhappiness of those with whom she mingles in the domestic and social circle. As well might we attempt to estimate the good done by the silent dews of night, or tell the amount of evil produced by poisonous miasmas that float unseen upon the air, as to calculate what woman has done "to save, to ruin, to cure or bless those who are brought within the reach of her influence." Not till the great day of final account will it ever be known how many have been purified, strengthened and ennobled by association with the good, the gifted, and the pure of the gentler sex in the various relations of life; or how many intellectual and moral natures have been perverted, weakened, and destroyed by the influence of weak, unprincipled and frivolous women to whom they were bound by the ties of consanguinity or friendship. Not until JEREMIAH shall have opened the Book of his Remembrance, in which "our not doing is set down among our darkest deeds," will woman herself be enabled to

see the amount of good fruit springing from a faithful discharge of every duty to herself, her family, society and her Maker; or the evil results growing from a neglect of those duties, and a perversion of the talents nature has given her.
Avoca, N. Y., 1859. E. B.

Written for Moore's Rural New-Yorker. EDDIE'S GRAVE.

"The flower that blooms the brightest,
Is doomed the first to fade,
The form that moves the lightest,
In earth is soonest laid."

"As dust to dust, and ash to ash," and they consigned the little sleeper to his last, long home. After days and nights of intense suffering the worn and weary one found rest. He who had for six short summers been the light and joy of the household,—he who had made so many hearts glad with his merry laugh, quick and buoyant step—had passed from earth, leaving hearts lone and desolate. Methinks, even now I see him with the glow of health upon his cheek, those bright and sparkling eyes, again bear the echo of that clear, merry laugh, telling in stronger terms than language could, of a free and happy spirit. But no; yonder grassy mound upon which lies a tombstone, with his name and age inscribed thereon, also a vacancy in the family circle, a void and aching in our hearts which refuses to be satisfied because one is not,—all these remind me that he has passed "to that bourne from whence no traveler returns." And yet, though mourning, we can rejoice (his earnest faith and child-like love for Jesus witnessing a change of heart,) that these little feet had wandered long and been firmly set in the broad road which leads to destruction and death, God in His great mercy plucked our bud and transplanted it to bloom in the Garden of Paradise.

But our little grave is not the only one,—our wounded hearts do not bleed alone,—oh, no;

"There's many an empty cradle,
There's many a vacant bed,
There's many a lonely bosom
Where joy and light have fled.
For thick in every graveyard
The little hillocks lie,
And every hillock represents
An angel in the sky."

Hillsdale, Mich., 1859.

ADDIE E. WALKER.

LADIES AND WOMEN.

SOME words have a magical effect on us from the mental pictures connected with them, or from the estimation in which we think the things represented by them are held. If two or more words express the same qualities in an object, and one of these words implies a manifestation of these qualities more valued, we are flattered when that word is applied to us. What female is not more pleased to be called a lady than to be called a woman? When the word is spoken, nobody, now, thinks of what is said to have been its original meaning—one who gives bread. Neither, as commonly used in this country, does one think of a woman of rank, so called. But a lady is something vice—redolent of band-boxes. The word is suggestive of ribbons and dress-making, delicacy and leisure, money and ease; and the peculiarities of factitious refinement so predominant in the modern training of the young, that these things and conditions are as the good of life.

Lady!—the word is full of softness and refinement, accompanied with weakness and dependence. The white fingers, dexterous in ornamental art, glitter and tanzalize; the eye, unused to watch over the feeble, flashes to enchant; the voice, using culled words, rarifies with a sweetness never tested by corroding acids. Lady!—the word falls from the lips like the dropping of balsam. But, sometimes, we are amused by its queer use. We have heard of a woman who always calls her scrubbing woman, "the lady that washes for me." Why not? "Is Miss Potter a lady, mamma?" asked a little girl of six years, who was with her mother visiting in a certain city. "Yes, Miss Potter is a real lady," the mother replied. "But, mamma, she works!" returned the child; "she washes and cooks breakfast; how can she be a lady?" The ornamental only is associated with the word lady.

But the word woman smacks of nothing artificial. It means only what the Lord God made for man to love and to live with as part of himself—a dearer part, and a part he will not do without. Many men do, in truth, live their whole lives apart from this half which would make them perfect men; but it is because some lady has given them a serpent instead of the bread their souls craved; or the finer half has, in the transforming process of fashionable culture, become so changed to a lady, that the stupid men do not recognize in it the one designed to finish up the structure of their manhood. Perhaps, indeed, the modern schools have so modified mind and body, that the "last best gift to man" is no longer a "help-meet" for him; the rib is so bent that it will not fit; he dares not say it is his lost one. So the poor bachelor goes through life mourning for his spare-rib. All that he sees seems too polished to be natural.

What female, when called a woman, feels a quickening of the blood? None. It is a common word, expressing a common object, simple, free, and like all common things coming direct from God's hand, just adapted to a man's nature. Woman expresses just the combination of qualities which fills the vacuum in a true man's heart; just what is fitted to establish his happiness, to perfect his human existence. When a real woman marries a real man, they cannot be put asunder. God hath joined them. Ladies can never meet the heart-want of man. If they marry, it is to their mutual sorrow and chagrin. Ladies are beautiful, enchanting. But the true man wishes to go through life a natural being rather than an enchanted one. His highest earthly aspiration is to walk, side by side, in sunshine and in storm, with a woman.—Selected.

THE National Era says it is not for the generation among whom Elizabeth Browning has sung, and Charlotte Bronte spoken, and Harriet Hosmer chiseled, and Rosa Bonheur painted, and Mary Lyon taught, and Florence Nightingale lived, to despair of woman's achievement of her highest destiny.

OLD FRIENDS TOGETHER.

O, time is sweet when roses meet
With spring's sweet breath around them;
And sweet the cost when hearts are lost,
If those we love have found them;
And sweet the mind that still can find
A star in darkest weather;
But naught can be so sweet to see
As old friends met together.

Those days of old, when youth was bold,
And time stole wings to speed it,
And you ne'er knew how fast time flew,
Or, knowing, did not heed it;
Tho' gray each brow that meets us now,
For age brings wintry weather—
Yet naught can be so sweet to see
As those old friends together.

The few long known, whom years have shown
With hearts that friendship blesses;
A hand to cheer, or purchase a tear,
To soothe a friend's distresses;
Who helped and tried, still side by side,
A friend to face hard weather;
O, this may we yet joy to see,
And meet old friends together.

REFLECTIONS.

FAR back in the unfathomable depths of the "beginning" was conceived the creation of the universe, and, touched by the hand of Omnipotence, myriads of worlds came forth, vying with each other in rendering homage to Him "who spake and it was done." The "morning stars sang together" in the joy of their new existence. The Creator beheld the beauty, the harmony, the glory of His work, "and it was very good."

Indelibly written on every leaf was the character of its Author, but it was not complete until mind preface the great book of Nature—the likeness of Divinity. Fallen spirits read and envied, and with "malicious leer malign" they sullied the purity of that likeness, and sin, with all its hideous forms, marred the symmetrical beauty of the greatest work which ever emanated from the hand of the Divine Artist.

Man, eager to solve the mysteries of obscurity, strives in vain to unravel the intricate purposes of God which He has wisely hidden from his dependent creatures. Although man has made great discoveries in regard to the laws which govern the material world, and has made the elements obedient to his will, spanning the waters of the deep, and looking into the starry heavens to measure other worlds, there are boundaries to knowledge which he may not pass. The finite is lost in the infinite, and in the incapacity of his soul, he sees the distance between the creature and the Creator. But this strange part within, struggling to break the fetters that bind it as it roams through radiant fields of thought in search of something to answer the inspiration of its existence, is it never to soar at pleasure beyond the confines of its material abode? Yes, we thank our Maker for the immortality He has given us. There will be a time when the child of God will traverse the golden streets of the New Jerusalem—when, washed in the pure waters of the River of Life, his soul shall mount on wings of immortality to fathom eternity, then to bask in the sunshine of eternal truth, which folds in its wide embrace the majesty of creation, and the purposes of Divinity.

Who art thou, O man, that boastest of thy wisdom or thy might? Look out upon the starry worlds above and then consider, that, with all the glory thou wilt have in thy future home, still, thou mayest be least in the kingdom of Heaven. If each orb is peopled with intelligent beings, as we have every reason to believe, then, at the consummation of all things, will a myriad of intelligences surround the throne to give all the glory to the Creator of the universe. Of the capacity or condition of mind possessed by the inhabitants of other worlds we can form no correct estimate. It is a beautiful thought which we have seen expressed, that perhaps they have never sinned and are constantly enjoying the presence and the smiles of God. Perhaps their capacity of mind increases in proportion to the splendor and magnitude of their respective abodes.

If the Creator had given us a more beautiful, or a larger dwelling place, with our present powers of mind, our knowledge and comprehension of the same would be proportionally less. So we may suppose that the inhabitants of many other globes have arrived at a greater degree of development and advancement in knowledge than ourselves. Hence, when all are gathered together, from one end of Heaven to the other, they will be capable of enjoying more, and will occupy higher seats in the place prepared for all the righteous. Then, mortal, humble thyself in the dust, for "what is man that thou art mindful of him, or the son of man that thou visitest him?"

JANE E. H.

Pittsford, N. Y., 1859.

PICTURES.—A room with pictures in it, and a room without pictures, differ about as much as a room with windows and a room without windows. Nothing we think is more melancholy, particularly to a person who has to pass much time in his room, than bleak walls with nothing on them,—for pictures are loop holes of escape to the soul, leading to other scenes and other spheres. It is such an inexpressible relief to a person engaged in writing or even reading, on looking up, not to have his line of vision chopped off by an odious white wall, but to find his soul escaping, as it were, through the frame of an exquisite picture, to other beautiful and perhaps heavenly scenes, where the fancy for a moment may revel, refreshed and delighted. Thus pictures are consoling of loneliness; they are a relief to the jaded mind; they are windows to the imprisoned thought; they are books; they are histories and sermons, which we can read without the trouble of turning over the leaves.—Downing.

Written for Moore's Rural New-Yorker.

MIND YOUR OWN BUSINESS.

How much trouble would be saved in this world if every one would remember and practice upon the old adage, "Mind your own business." Curiosity is a principle implanted in every human being, but it was never intended that it should degenerate into that mean, prying-into disposition which we discover everywhere about us. In every community there is a class of persons who well deserve the title of "busy-bodies," for they spend all of their time in minding everybody's business but their own. Do a couple see fit to marry, every fact in the history of each is chronicled, and many are the wonders how they happened to choose each other—just as if that were any one's business but their own. Did you ever hear of a match that suited everybody? I never did any but *Lucifer matches*. Yet whose business is it, if people suit themselves?—what should we care? Does a stranger make his appearance in town—then, who is he? where did he come from? what is he worth? are questions which give our "busy-bodies" employment for some time. Let a person do anything a little out of his line of conduct, and how quick is it noticed and commented upon, just as if 'twere anybody's business what anybody's business is.

Finally, there is no character more despicable than these "busy-bodies"—tattling, mischievous, slandering "busy-bodies," how easy the ascent—how quick they carry the mark of the "green-eyed monster." What do they gain? Not the least thing. They are despised by everybody. If we would be learned, wealthy and respected, we must "mind our own business." They only who labor can win the prize. Yes, "mind your own business" ought to be thumped into the head of a great many people in the world, for they are a disgrace to themselves, to the community and the world. Cayuga, N. Y., 1859. AMELIA.

WHAT IS WIT?

THE term "wit," in its oldest signification, generally implied rationality, and so we understand it in its derivations "to wit" (to know) "half-witted," "witless," &c. In the time of Dryden, it expressed fancy, genius, aptitude. Thus the famous couplet:

Great wits to madness are allied,
And thin partitions do their bounds divide,

is almost an amplification of that "fine frenzy" which Shakespeare has delineated, and "wit," in this sense, is merely a synonym of imagination. Locke, who was a cotemporary of Dryden, defines wit as lying most in the assemblage of ideas, and putting those together with quickness and variety, wherein can be found any resemblance or congruity, thereby to make up pleasant pictures and agreeable visions in the fancy. This definition of wit he places in opposition to judgment, which, he says "lies quite on the other side," in carefully separating one idea from another, wherein can be found the least difference, thereby to avoid being misled by similitude and affinity, to take one thing for another.

Addison quotes this passage in the Spectator, and says:—"This is not, I think, the best and most philosophical account of wit I ever met with. I shall only add to it, by way of explanation, that every resemblance of ideas is not what we call wit, unless it be such a one as gives delight and surprise to the reader. These two last properties seem essential to wit, more particularly the last of them." To come down still later, Dugald Stewart endorses Locke, with this addition, that wit implies a power of calling up at leisure the ideas which it combines, and Lord Kame denominates wit a quality of certain thoughts and expressions, and adds—"The term is never applied to an action or passion, and as little to an external object." Wit, in the modern sense, has a very different meaning.—Selected.

A GOOD OLD MAN.

A good old man is the best antiquity, and which we may with least vanity admire, one which time has been thus long a working, and, like winter fruit, ripened, while others are shaken down. He hath taken out as many lessons of the world as days, and learned the best thing in it—the vanity of it. He looks over his former life as a danger well past, and would not hazard himself to begin again. The near door of death saps him not, but he expects it calmly as his turn in nature, and fears more his recoiling back to childhood than dust. All men look to him as a common father, and on old age, for his sake, as reverent. He practices his experience on youth without the harshness of reproof, and in his counsel is good company. He has some old stories still of his own seeing to confirm what he says, and makes them better in the telling; yet is not troublesome with the same tale again, but remembers with them how often he has told them. He is not apt to put the boy on a younger man, nor the fool on a boy, but can distinguish gravity from a sour look, and the less testy he is the more regarded.—You must pardon him if he likes his own times better than these, because those things are follies to him now, that were wisdom then; yet he makes of that opinion too when we see him, and conjectures those times by so good a relic. He goes away at last, whensoever, with all men's sorrow but his own; and his memory is fresh when it is twice as old.—Bishop Earle.

HOUS.—How touchingly beautiful are the relations of home! There each is bound by an electric chain, that seems to pass to all hearts in the family group; so that one cannot enjoy pleasure unless all partake in it. If one heart is oppressed, all sympathize; if one is exalted, all must share the happiness. It is in the home where the aching heart is soothed, where the oppressed are relieved, the outcast reclaimed, the sick healed, or falling, the tear of pure love drops from the mourner's eyes, when the dear ones are gathered to their long home.—Selected.

SPEAKERS AND HEARERS.—Hearers will always give speakers their attention, if speakers will give hearers something to attend to. That the former may be interested, it is necessary that the latter be interesting.—Dr. Emmons.

Written for Moore's Rural New-Yorker.

"GOD SAW THAT IT WAS GOOD."

God spake,—not e'er before a sound,
Had stirred the dark abyss profound—
"Let there be light," and forth it came,
Not in a faint and flickering flame,
But pure, effulgent, from the Throne
Of Him in whom is light alone.
And Day and Night twin sisters stood—
God saw the light that it was good.

God spake—the firmament came forth,
And sun, and moon, and stars had birth;
The gathered waters, seas were called,
Alone by His firm mandate walled;
Then Earth appeared, but 'twas not blest
With ought to cheer, till His behest
Brought grass, and herb, and fruit for food—
God saw His work that it was good.

God spake—the waters teemed with life,
And birds, with song and beauty rife,
Sped thro' the air in tireless flight,
To find an ever-new delight.
And wild beasts roamed, not to destroy,
And creeping things in life found joy.
Sin had not cursed—man had not trod—
God saw His work that it was good.

God spake, and Oh, what wondrous plan
Filled th' Almighty's thought, when man
In angel grace and beauty came
His power and wisdom to proclaim!
In God's own image—how the sight,
The angels fill with deep delight,
And wonder—not yet understood—
God saw His work, and lo! 'twas good.

The tempter came—ah! evil hour,
When first he sought our mother's bower.
Now, Desolation, like a wave,
Roll over all—the earth's a grave
For every living beautiful thing—
Yet still we to our idols cling,
And ask why Sorrow, Darkness brood?
The answer still—"God saw 'twas good."

Yes, good; for earth no more can be
Fit dwelling-place, its melody
Is mingled with discordant sounds,
Which Sin has made. There e'er resounds
Some note of grief, or sigh of woe,
Or fend-like lone where'er we go;
And thus the heart forever pines
For happier realms and purer climes.

And Heaven—Oh! ear hath never heard
The thrilling notes by angels stirred!
And eye ne'er oped in world like this
On scenes of such transcendent bliss.
We'll bless the hand that smites to dust
The cherished idols that we trust,
While "tempest-tost and rudely driven,"
We'll seek to find our rest in heaven.

Hillsdale, Mich., 1859.

JULIA.

Written for Moore's Rural New-Yorker.

IMMORTALITY.

"Whenon this pleasing hope, this fond desire,
This longing after immortality?
Or whence this secret dread, and inward horror
Of falling into naught? Why shrinks the soul
Back on herself, and starts at destruction?
'Tis the divinity that stirs within us;
'Tis Heaven itself that points out an hereafter,
And intimates eternity to man."

We all know that beyond the turbid waters of death lies a better country—"even an heavenly." It is taught, not only in Revelation, but all Nature, from the murmuring rivulet to the boundless ocean, seems to say to us, "thou art immortal." And there is a something within that is ever telling us this is not our *entire* life; it is merely the dawning of a more glorious and unending one, which is enshrouded in the impenetrable folds of the mysterious future to be disclosed ere long to our enraptured gaze in all its resplendent beauty.

Oh! how it buoys the sinking spirits of the weary invalid, as he tosses in physical anguish, to feel, to *know*—blest assurance—that there is a world to which he is fast hastening where there will be neither sickness nor sorrow. How the grave loses its horrors illumined by such a faith, in the pure, soul-soothing light of which we may enter its otherwise gloomy portals hopefully, trustfully, knowing it is but the entrance to an "Eternal City whose builder and maker is God."

It is impossible with our present organization to have a perfect conception of what we shall be when unincumbered by this earthly tenement, "for it doth not yet appear what we shall be; but we know that when He shall appear we shall be like Him, for we shall see Him as He is." And it is well we do not, lest becoming weary with the disasters of this inconstant life, we should wish, and even dare to rush unbidden to our final home, forgetful of the duties to be performed, ere we shall become fitted for that holier, nobler life. Even now, when by faith we catch a glimpse of that heavenly world and the glorious things in reserve for us, our souls would fain leave the baser things of earth, and soar on spirit-wings to heights unseen, unknown to mortal man. Nevertheless, we are content to "abide our time," and cheerfully labor on, hope on, striving to perform aright the duties assigned us, and then, when this material body shall have become spiritual, we shall, with unclouded vision, behold the unspeakable glory of God. Is it not enough, to know that "we shall be like Him?" F. M. TURNER.

Oxford, N. Y., 1859.

A CHRIST-LIKE SENTIMENT.—Rev. Dr. Johns, an Episcopal clergyman in Baltimore, says of excessive denominationalism:—"Wherever this goes beyond love for souls, something is wrong. So fearful am I of this spirit that I have been accustomed for years in passing a house of worship of some other denomination than my own, to lift up my heart to God in prayer for that minister and his people."

MAN was made in the image of God that he might understand Him.

THE TRAVELER.

LETTERS FROM A HUNGARIAN.

FUNDUS SEVEN.

Read to Fared, the most celebrated Water-Cure of Hungary—Indian Corn—Lake Balaton—Scenery—Remarkable Echo—The Villagers at the Water-Cure—The Peasantry on Sunday—The Great Prize-Winners at the Lottery—Concert, a Jewish Violinist—Return to Grom—Gipsies on the Road—Clay Houses.

DEAR FRIEND MOORE:—After having visited the capital and principal fortress of Hungary, Buda-Pesth, I made another excursion into the interior of the country to learn more of the character of the real Magyars, and for that purpose started for the most celebrated Hungarian water-cure, Fared. I accordingly entered the mail-coach (when the railroad now in progress is finished, the conveyance will be twice as cheap and convenient) at the post-office in Pesth; and after a journey of fifteen hours, interrupted only by the change of horses at every station, we reached the most favorite and elegant (and, of course, most expensive) bathing-place of Hungary, situated on the shores of Lake Balaton, a sheet of water about fifty miles long and six in breadth, some eighty miles south-east of Pesth. The road through which we passed carried us through several towns and villages, over hills and valleys, none of which, however, are of sufficient importance to demand special mention. The valleys lying the macadamized highway on both sides, bloomed most luxuriously with various kinds of grain, potatoes, and that most abundant *Kuckuruts* (the Hungarian name for Indian corn.) So richly does this product cover the fields throughout Hungary, that during three months in the year, it is never wanting as a dessert, after dinner and supper, among the rich and poor. In one of the national melodies of the Magyar this grain is immortalized as an everlasting companion. It is rather strange that an article so abundant in Hungary, should be called "*Turkish wheat*" in German, and "*Indian corn*" in English. This latter appellation has led many farmers in the United States to believe that it is only grown in America; and I recollect seeing an educated farmer in the very city which may boast of issuing so well-conducted a journal as the *RURAL*, perfectly surprised at my telling him that I had seen *Indian corn* long before coming to America, and that I had up to my twelfth year probably eaten more "*Kuckuruts*" than any Yankee of equal age. Another particular that may not be uninteresting, especially to your agricultural readers, is the fact that in one place the fields were, for several miles in extent, almost literally covered with stones as big as a man's head, and yet potatoes and other vegetables grow here in great abundance. The stones are left on the field, as the plant nevertheless forces its way through all obstacles; and it is only when fears are entertained lest the too vast collection of rocks suffocate the germ that the largest are removed and gathered in a heap.

After this digression about the road, let me tell you what I saw at Fared. This place consists of but one street—the houses of which are mostly hotels of more or less magnificent styles—at the end of which stands a chapel where, during the bathing season, (from May to September,) divine service is held on Sundays and other holidays. Around this street are many promenades and an elegant park, in the center of which stands the *Sauerbrunn* ("sour fountain.") The water of this well has an acid taste, but is most agreeable to the palate and salutary to the body. Large quantities of this healthy water are sent in corked bottles to all parts of Hungary, where it forms a most luxurious beverage when mixed with wine. The addition of a little sugar causes the mixture to foam like ordinary soda-water, thus creating a most refreshing, invigorating, and cooling draught during the summer. But though such large quantities of this water are exported, it is here (at the water-cure) offered gratis to all as the fountain seems inexhaustible; and the man who stands at the well furnishing all who will with a glass, seems to me to proclaim, in the language of Isaiah:—"Ho, be that thirsteth, come ye and drink," &c. Not so, however, is it with the delicious fish who "multiply and increase" in the *Platzeus* (Lake Balaton.) Although these thrive here in great abundance, yet so superior are they to all others, that they, also, like the water of the fountain, are carried in such vast quantities to the markets of the larger cities, as to render them enormously dear even in the place of their nativity—about half a dollar a pound.

The scenery, on the whole, is most charming and picturesque, particularly on the rising hills of the opposite shore of the lake, where the echo is so perfect that if you make a speech in *one breath*, it will be repeated *verbatim* with the greatest distinctness. The lake itself seems to be a magic reflector, for when the sky is here and there veiled with thin, fleecy clouds, the limpid waters throw the various hues of red and blue. To a spot so delightful it is no wonder that the people are annually attracted; and, though the waters of the lake are fitted principally for patients, vast numbers of the wealthy and healthy flock hither just to show and enjoy themselves, while not a few make grand preparations and adroit displays to "catch a beau," or a "belle," as the case may be. In this way Fared, like many of the fashionable water-cures of America, is growing more and more aristocratic, frightening away the real but unfortunate patients of *Acapulco*. Still, there is one day when you can see hundreds of the poorest classes, even, the strong as well as the weak, either basking in the sun or standing in the large common baths. This is on Sunday, when the peasants of the neighboring villages come, one and all, bringing with them what food they need for the day, and enjoying the mule in the park with the satisfaction, on their returning, of not having left a copper at the fashionable summer resort. I had thus the opportunity of seeing the most magnificent apparel beside the simple, peculiar dress of the genuine Magyar; the expanded crinoline beside the many-folded,

gaily-colored Sunday petticoat; the tight pantaloons of the dandy beside the peasant's linen trousers (*Gatya*) of almost fabulous width. Nor is that peculiar garment of the Magyars wanting—the *Bunda*. This is a long cloak of sheepskin which, as the peasant maintains, protects him against heat as well as cold. In cold weather he wears it with the woolly side in, in warm weather he turns the woolly side out. Some of these Sunday visitors spend all day in the bath, though the physicians advise their patients not to spend more than half an hour in the water, nor bathe more than twice a day. But these unsophisticated peasants, being informed that most patients must take from twenty to sixty baths a season, think their bathing ten hours in succession must be an equivalent to at least twenty baths of half an hour each; and so they often come out of the water with hardly strength enough to keep them on their feet.

While I was walking up and down in the park with a friend of mine, I noticed several persons whose awkward demeanor, yet proud gait and splendid dress showed them to belong to the class of beings favored, by Mammon, but sadly neglected by the divinities of wisdom and common sense. Nor had they a noble birth to boast of. Still they excited attention and formed the topic of conversation in many a circle. "These," said my friend, as he noticed my somewhat surprised countenance, "these are among the happy few who had the fortune of winning the great prize at the imperial lottery. Yes, they are few, indeed, whose lot turns out so favorable; while hundreds are annually ruined by sitting down with a blank. An industrious shoemaker died some years ago in *Comorn*, among whose effects was bequeathed a box of blanks which amounted to near 1,000 florins (about \$500.) Thus does the government give its sanction to that hazardous game which saps the accumulated savings of thousands of its subjects." The remarks of my friend need no comment. Justly did the Hungarian patriots of '48 demand, among other points, the abolishing of the prevailing lottery system. The incomes of the lottery, it is argued, are applied to the building of highways and other public works. But, it seems to me, that, by these public works is meant the numerous palaces of the imperial house of Hapsburg.

In the evening (Sunday) I had the pleasure of attending a concert, the hero of which was a musical genius only ten years of age, who executed some of the most difficult compositions of *MEYERBEER*, *HALEVI*, and others, on the violin. This young genius, who bids fair to rival *OLE BOL*—and will then, no doubt, "astonish the natives" of America, also—is a little Jew, *LEOPOLD ABER*, by name, and happens to be a native of the same city where I was born, viz., *Wesprim*, a few hours' ride from the summer retreat I am now describing. This boy affords another testimony that, though the sons of Israel have "hung their harps on the willows by the streams of Babylon," they have not forgotten the art of the Levitical choirs of old, but do even now challenge the admiration of the world, in such persons as *THALBERG*, *VISUTANSKY*, *ERNST*, *DALLAS* (a Jewess at the royal opera of Vienna,) not to speak of the many Jewish composers, such as *MENDELSSOHN*, *BARTHOLOMEY*, *METZGER*, and others.

Having arrived at Fared in August, when the "season" was already drawing to its close, I no longer found the place so filled as it is in the early part of the summer. Most of the guests had already left, and so I determined to leave myself after having several times enjoyed the truly refreshing baths of the lake. For the sake of variety, I now took a different route from that on which I had come hither, and accordingly left with the omnibus (which is cheaper but not half so comfortable as the mail-coach, the former taking twelve passengers while the latter carries only six,) for *Gron*, the city where I first stopped on my arrival in Hungary, and of which I have given you a description in one of my previous letters. But though I now traveled a different route, I observed nothing new worth chronicling, excepting the large number of dirty villages, with no sidewalks in the streets, nor even closed yards to the houses. These are mostly built of clay which the peasant stamps himself, and piles together in thick, crooked walls, whose only beauty is the glistening whiteness. But the Hungarian farmer feels quite content within these loam walls, which, like his *bunda* (cloak,) keep out the heat in summer and the cold in winter. Wherever we stopped for refreshments, we were regaled with the lively melodies of Hungary played either by Magyars or by that strange, dispersed race, the Gypsies, who wander about from place to place, the husbands playing music and the women telling fortunes by cards. How it happens that this forlorn race abounds more in Hungary than in any other country, I have never been able to ascertain. But such is the fact, and were it not that the Hungarians are passionately fond of music, the Gypsies would not be tolerated here either, they being of the foulest character. But I must not weary you with so many details, and hasten to bring this lengthy epistle to a close.

Yours, SIMON TUSKA.

THE CHAMBERLAIN—*Singular Fact*.—Mr. Buckland, the great Naturalist, says:—"Betwixt the two sides of the body there seems a lack of sympathy. One eye may be looking straight forward, while the other is looking as directly backward. One may be entirely asleep, while the other is wide awake. And this kind of independent and separate action applies to each side of the creature—to its limbs. It cannot swim, because its limbs refuse to act in concert. Could the two sides understand one another, and agree on a prescribed course of action, it might always be awake, or half awake. But it gains nothing by its unilateral independency; the two sides are like two horses that won't work in harness. It seems strange, with such a peculiarity, that on trees, or *terra firma*, the creature should be able to make any progress. But as the two sides are fed by one mouth, and, as the insect tribes refuse to come to it, so they seem in regard to all culinary matters, to agree to sink their differences, and to move in harmony. The stomach is a potent harmonizer."

The rich man travels as he pleases, the poor man as he can.

THE HARBOR OF ACAPULCO.

THE Harbor of Acapulco, on the shores of the Pacific, appears like a nest scooped out of the mountains, into and out of which the tide ebbs and flows by a double entrance given by an earthquake in the solid rock. Tradition says another once existed, which an earthquake closed, while it opened the present channels. There is still in the sharp mountain ridge, that shuts it from the sea, another opening, dug by the labor of man, at a point opposite the entrance of the harbor; to let in the cool sea-breeze upon one of the hottest and most unhealthy places upon this continent. Such, in substance, is and was the little city of Acapulco, the seat and focus of the Oriental commerce of New Spain, and of the Spanish Empire.

It was not discovered when Cortez built in Colima the vessels that went to search for a north-west passage; but when they had returned from their fruitless voyage, they anchored in the mountain-girt harbor of Acapulco. The discoveries of the celebrated navigator, *MAGELLAN*, fixed the commercial character and importance of this seaport. He had sailed through the straits that bear his name, and coasted northwardly as far as the trades. And from thence he bore away to the Spice Islands, discovering on the voyage the Philippine Islands, where the city of Manila was founded. By this voyage he demonstrated that the advantages of a route across the Pacific were so superior to a voyage around Cape Horn, as to justify the expense of a land transit from Acapulco to Vera Cruz, and re-shipment to Spain. Now that the Panama Railroad is made, this demonstration may prove advantageous to other nations.

The practical advantage of this discovery was

the establishment of the Manila Company, whose annual galleon carried out 1,000,000 silver dollars to purchase Oriental products for the consumption of Spain and all her American colonies. In this galleon sailed the friars that went forth to the spiritual conquest of India. In it sailed Spanish soldiers, who followed hard after the priests, to add the temporal to the spiritual subjugation of Oriental empires. To this harbor the galleon returned, freighted with the rich merchandise of China, Japan, and the Spice Islands. When the arrival of the galleon was announced, traders hastened from every quarter of New Spain to attend the annual fair. Little vessels from down the coast came to get their share of the mammoth cargo. The king's officers came to look after the royal revenue; and caravans of mules were summoned to transport the Spanish portion of the freight to Vera Cruz. Thus, for a short time, the population of this village was swollen from 4,000 to 9,000, which fell off again when the galleon took her departure.

Such was the commercial condition of the town of Acapulco down to the time of the independence. From this time it was lost to commerce, until it was made a half-way house on the voyage to California. The town lies upon the narrow intervals between the hills and the harbor. It is built of the frailest material, and is destroyed about once in ten years by an earthquake.

The castle of San Diego stands upon the high bank, and, though commanding the entrance to the harbor, is itself commanded by the surrounding high lands, and has so often been taken by assault during the last thirty years as to be considered untenable.—*Wilson's New History of Mexico*.

RISE OF WATER IN LAKE ONTARIO.

EDS. *RURAL*.—The rise of Lake Ontario for the last six weeks has been fearfully rapid. Not less than fourteen inches, during that time, have been added to its then unusual elevation; and at the present time it is about five feet above its lowest level.

Storms, when the water is so high, are always more or less destructive, in proportion to their violence, washing away land and sometimes other property. Saturday last we were visited by the most destructive storm that we ever witnessed here. The wind, attended with rain and snow, blew a gale from the N. E. most of the day; tearing up everything vulnerable in that direction. In the afternoon it changed into the N. W. and continued through the night, part of the time with increased violence, and abated not in its march of ruin till it strewed the shore for a great distance with the ruins it had wrought. The long and expensive wharf of B. Todd & Sons, together with one warehouse, were completely demolished and scattered along the shore. Another warehouse belonging to them is completely riddled, the floor torn up and the north end carried away. The wharf of Mr. J. Reynolds was swept clear of everything that lay above the water, every plank torn away, and a large quantity of cedar posts were cast upon the water, and now lie piled promiscuously along shore. His two warehouses did not escape material damage. A large blacksmith shop, built of cobble-stone, two stories high, (originally some forty feet from the lake, and protected by a wharf,) was ruined by the storm. The whole side next the lake fell with a crash about nine o'clock last evening. We heard that three vessels went ashore near *Sodus* last night (doubtful) and one five miles east of this place. The lake has been high for several years. Last summer it was some ten inches above its present height, and about that number of inches higher than ever known before; but it fell during the fall and winter about two feet, and commenced rising again some six weeks ago.

D. C. H.

Palmyville, N. Y., April 23, 1859.

REMARKS.—According to the regular measurement of the level of Lake Ontario for several years, at the Port of Genesee, at the mouth of the Genesee, this statement and several others need some correction.

The change in the level has been greater in a month than this here given. The level has risen six and a half inches in April and five in March, and is now three and a half inches lower than in Aug., 1858.

The lake has not been rising for several years; for the lowest known here in thirteen years was in Feb., 1857, as low into one inch in 1850, and into two inches in 1849 and in 1846. Indeed the lake was low the last five months of 1856, lower still in Nov. and Dec. of that year, and in Feb., 1857, the lowest, as already stated. It then rose to the mean height in May, 1857, and was the highest that year in October. It was high in Jan., 1858, and highest in August, 1858. Since that time it has fallen

some, but is now quite high again. The variation of the level at Toronto corresponds to this here nearly in time and quantity.

The range here in thirteen years has not exceeded fifty-four inches, and occurred in 1857 and 1858, the water being lowest in Feb. of the former and August of the latter.

The lake rises or falls from the varying quantity of water from rain and snow, and of evaporation, as the principal causes, the excess being poured from the great water-shed into this great natural reservoir prepared for it. The rise of Lake Ontario has been expected on account of the great rains at the West. It would not be strange to find the level yet higher. There is no difficulty in accounting for the change but that of the varying quantities of rain at different times and in different years.

May, 9, 1859.

C. D.

TEA-TASTING.

Few of our readers are aware that tea-tasting is reduced to a regular profession, one which is as certain death to a man as the continued practice of opium-eating. The success of the tea-broker, or taster, depends upon the trained accuracy of his nose and palate, his experience in the wants of the American market, and a keen business tact. If he has these qualities in high cultivation he may make from twenty to forty thousand dollars per annum while he lives, and die of ulceration of the lungs. He overhauls a cargo of tea, classifies it, and determines the value of each sort. In doing this he first looks at the color of the leaf and the general cleanliness of it. He next takes a quantity of the herb in his hand, and, breathing his warm breath on it, he snuffs up the fragrance. In doing this he draws into his lungs a quantity of irritating and stimulating dust, which is by no means wholesome. Then, sitting down at the table in his office, on which is a long row of little porcelain cups and a pot of hot water, he "draws" the tea and tastes the infusion. In this way he classifies the different sorts to the minutest shade, marks the different prices, and is then ready to compare his work with the invoice. The skill of these tastes is fairly marvelous, but the effect of the business on their health is, as I have said, ruinous. They grow lean, nervous, and consumptive. At the end of a hard day's work they feel and act as if they had the hysterics.

CROCODILES.—After burying the eggs in the soil, there to be matured by the sun, the female visits, from time to time, the place in which they are secreted, and just as the period of hatching is completed, exhibits her eagerness for her offspring in the anxiety with which she comes and goes, walks around the nest of her hopes, scratches the fractured shell, and by signs which resemble the bark of a dog, excites the half-extricated young to struggle forth into life. When she has beheld, with this sort of joy, fear and anxiety, the last of her offspring quit its broken casement, she leads them forth into the placid pools away from the river, and among the thick underwood, to avoid the predatory visits of the father, whose palate delights in nothing more than the flavor of his own young, which he eats remorselessly on every opportunity. In this season of care and watchfulness over them, she is ferocious, daring, and morose, guarding with inquietude her young, whenever they wander. She turns when they turn, and by whining and grunting shows a peculiar solicitude to keep them in such pools only as are much too shallow for the resort of the full-grown reptile.

YOUNG RURALIST.

PLEASURE GARDENING FOR YOUTH.

MESSES. EDITORS:—Once or twice before I have undertaken to tell my young friends who read this department of the *RURAL* how to grow Melons. I do so with good confidence that I am not writing about an uninteresting subject, for all the boys and girls like good melons. The best soil for the melon is one that is warm and sandy; in fact, I do not care how sandy it is if I have a little well rotted manure to enrich it with. But all who would like to grow and eat melons cannot find such a soil as this, and therefore they must plant on the best they have. There are very few difficulties of this kind, however, that cannot be overcome, if we try in earnest. This is a lesson that I learned long ago, and never have forgotten it. This is the way I have always prepared hills for melons in a heavy clay soil, and I have never failed to grow them so good as to make the boy's mouth water—in fact they have presented so great a temptation that many dishonest fellows have robbed my melon patch. I regretted, of course, the loss of my melons, but I regretted far more that any young men should so far forget the right as to do so mean a thing, and pursue a course very likely to lead them to even still worse practices, and finally, perhaps to prison. Most of this practice, I think, is the result of thoughtlessness, for some boys, I have no doubt, have taken my melons, who would die rather than steal a chicken from my fowl-house, or a dollar from my pocket. And yet some nights they have done more mischief to my melon patch, and caused me more loss than though they had robbed me of half-a-dozen fowls or as many dollars. Boys that will grow melons themselves, or any other fruit, will not steal thoughtlessly; they know how much care and time it takes to grow good fruit, and how much a person prizes a fruit that he has raised, often far above its market value. Sometimes I have had a pear picked thoughtlessly that was worth only a few cents, and yet we would not have lost it for several dollars. After we have grown a tree two, or three, or more years, we look anxiously for the first fruit, to see its quality, and its loss causes great disappointment and regret.

Well, this has not much to do with growing melons, but still it will be useful I hope, to the youth, whom I love as well as fruits and flowers; in fact I never talk and think of children, but I compare them to flowers, and get them all mixed together,—the children are the flowers of the family, some of them wild ones, with prickles and thorns,—like thistles, they annoy everybody that has anything to do with them, while others are as sweet as the violet, and beautiful as pink. The flowers are the children of the field.

But I must keep to the melons. If you have only a heavy soil, then dig holes six or eight feet apart, where the hills are to be. Make them four feet in diameter and about eight inches deep in the center, running to nothing at the edges. Then go to some sandy knoll in the woods and gather the surface soil, which will be composed of decayed leaves and sand. Fill the holes with this material, making it about three inches higher in the center than the natural soil, and round off the hill nicely. Plant six or eight seeds in each hill, though three strong plants are enough. The weak ones can be removed after danger from insects is past. Keep the ground between the hills mellow. This can be done in a large field by the cultivator, but in a small patch the best thing is the manure fork, and it should be done only in dry weather. Don't touch the soil or walk upon it when it is wet.

The time for planting is between the 20th of May and 1st of June. One of the best things for forwarding melons is a little box made of boards sloping towards the front and covered with one or more lights of glass as shown in the engraving. This should face South or South-east, and be placed over the hills, and after the plants are up a little air should be given warm days, by moving the glass one side, but nights and cold days it should be closed tight. After the weather gets quite warm, and the plants are so large as to fill the box, remove it. This is a sure protection against insects, and forwards the melons several weeks, which is a very important matter. Before removing the box it may be raised up by placing stones under it. If this is done for a week or so the plants will become so hardened that they will not notice the removal. Do this, and you will have good melons, whether your neighbors have any or not.

Monroe Co., N. Y., May, 1859. OLD GARDENER.

THE Poet Gray once said:—"I have discovered a thing very little known, which is, that in one's whole life one can never have more than a single mother." I said to a young artist once, in allusion to the kiss that Benj. West, when a boy received from his mother, for his picture of "the baby,"—"Sir, your mother ought to kiss you." "I have no mother," said he, and the emotion that filled his voice revealed the true man. No mother! Badly off is he whose mother cares not for him; still worse off is he who cares not for his mother.

If we do not learn to love the beautiful in youth we never shall. The Sabbaths are not the same to me now as they were in childhood; they are not so still; the sun rises more worldly; the cattle are not so devout. They have all changed, or I have, and not for the better.—H. W. Beecher.

THE alphabet of our knowledge is in our own faculties—in Hope, Fear, Love, Reverence, susceptibility to beauty, or what not.

MOORE'S RURAL NEW-YORKER

NEWS DEPARTMENT.

ROCHESTER, N. Y., MAY 21, 1858.

Latest News, Foreign and Domestic.

The telegraph last evening (Monday) informed us of the arrival of four steamers at New York and Quebec—the *Weser* and *Borussia*, from Bremen; the *Arago* and *Nova Scotia*, from Liverpool. The news received is four days later than that of the *Persea*, given in another column. There had not been a collision up to hour of sailing between the Austrians and French, but Austria had entered Sardinia and taken possession of two or three inferior towns, while France had declared war. We give a condensation below:

Queen Victoria has issued a Royal Proclamation, offering a bounty of £10 to able seamen willing to enter Her Majesty's service, with the intention of recruiting 10,000 additional seamen. The English naval dock-yards and arsenals are in a great state of excitement. Preparations for war were being made on an extensive scale. Admiralty instructions were received at Woolwich dock-yard April 30th, directing the acting master shipwrights to hasten with all possible dispatch the completion of the various new class steam frigates in process of construction.

The proclamation of the Austrian Emperor concludes as follows:—"Austria, faithful to her mission in the political world, has drawn the sword to defend the rights which treaties have given her, and to maintain the independence of European States."

Napoleon sent to the Corps Legislatif, on the 3d, a strong warlike manifesto, in which he says:—"Austria has virtually declared war against France, and nothing remains for France but to take up the sword in defence of Italy. He disclaims all idea of conquest, and professes nothing but the purest sympathy for Italy, and says he is about to place himself at the head of the army, and leave the Emperor and his son to the patriotic care of the French people."

Victor Emmanuel, King of Sardinia, addresses his troops as follows:—"Soldiers!—Austria, who is increasing her armies on our frontier, and threatens to invade our territory because her liberty reigns with order—because, not might, but concord and affection between the People and the Sovereign here govern the State—because the groans of oppressed Italy here find an echo—Austria dares to ask us, who are only armed in self-defence, to lay down our arms and submit to her clemency. That insulting demand received the reply it deserved. I rejected it with contempt. Soldiers, I tell it to you, convinced that you will take an insult to your king and to your nation as an insult to yourselves. The announcement I make to you is the announcement of war! Soldiers, to arms!"

In Washington, matters are pretty quiet just at present. The correspondent of the N. Y. *Herald* writes that Mr. Dallas, our Minister at London, has informed the Secretary of State of the disapproval by England of the treaty recently negotiated by Sir Wm. Gore Ouseley, and that they had given him peremptory orders to proceed to Nicaragua and conclude a treaty in accordance with his instructions.

The territorial routes, between Neosho, Missouri, and Albuquerque and New Mexico, and between Kansas Mission and Stockton, California, which were let by contract last year, have been discontinued, to take effect on the 1st of July next. The

failure of Congress to make the usual appropriation for the Post Office Department, the interruption of the mails, mostly from the presence of hostile Indians along the lines, and the consequent reduction of mail matter to a comparatively insignificant amount, are the reasons alleged for the discontinuance of this overland experiment.

Dispatches received from Minister McLean announce that he has arranged the basis of a treaty with Mexico, by which the right of way from the Rio Grande to Guaymas is secured. The neutrality of the Tehuantepec is also to be guaranteed.

From Nebraska and Kansas we learn that the inhabitants of the former Territory are earnestly agitating for the annexation of so much of Nebraska as lies south of the Platte river to Kansas, so as to secure her admission into the Union at the next session of Congress. The public sentiment in that portion of the Territory strongly favors the proposed annexation, and it was recently resolved in Mass Convention, that Nebraska City nominate delegates to the Kansas Constitutional Convention, which is to assemble at Wyandotte in July.

The latest Mexican dates are from Vera Cruz to the 8th, and the City of Mexico to the 1st of May. News unimportant. Gen. Robles was at Jalapa with 1,000 men. He has issued a decree forbidding the passage of the American mails. Great confusion existed at the Capital, where a change in the Presidency was daily expected, and an outbreak consequently feared. Miramon was trying to raise money from European capitalists, on a pledge of the church property, the Archbishop consenting to the mortgage. The English and French fleets were still at Sacrificio.

WHAT NAPOLEON CONTRACTS TO PERFORM.—A gossiping letter from Paris, speaking about the Austrian Emperor's mother, says:—"The Archduchess is a woman of the most powerful intellect, and still holds her rule over her son as firmly as in the days of his minority. Her penetration is proverbial; and she still consults with Metternich upon all subjects connected with the interests of the Austrian Crown. Ever since the marriage of Prince Napoleon, the suspicions of the lady have been aroused; and at length, by dint of artifice and money, of faith in themselves and the want of it in others, the experienced pair have succeeded in obtaining the full copy of the letters of Prince Napoleon and the Emperor of the French to the King of Sardinia, by which it becomes clear that the war in Italy is but a secondary object—that the ultimate end is the bestowal of Lombardy on King Victor, Rome on Prince Napoleon, Naples on Prince Murat, and the overthrow of Austria, which leaves the road open to Russia; and then—hurrah for the long-cherished idea of an attack on England!—the deed which is to render his name immortal as that of Caesar, and efface that of the great Napoleon, by performing that which even he never dared to do, and avenging him." A nice little job and very easily completed, no doubt!

MEDICAL INFORMATION SOUGHT.—At the suggestion of the American Pharmaceutical Association, the Secretary of the Interior has directed the following queries to be forwarded to the Indian Agents in the employ of the Government:—1st. What medicinal plants are used by the different Indian tribes in the vicinity of your agency? 2d. The medical virtues ascribed by the Indians to them, whether emetic, cathartic, diuretic, diaphoretic, expectorant, anthelmintic, stimulant, narcotic, tonic, astringent, or anti-spasmodic; the diseases said to be cured or alleviated by the respective plants? 3d. In what latitude are they to be found? 4th. In what quantities can they be obtained? 5th. How near to navigable streams can they be gathered? 6th. What facilities can be had for sending them to market? This information is to be forwarded to the Indian Bureau.

FAIRPORT CHEMICAL WORKS.—These Works, established some years ago by Mr. D. B. DeLand, at Fairport, in this county, rank among the most complete and successful of the kind in the Union. Last season the enterprising proprietor visited Europe with a view of obtaining a knowledge of any improvements worthy of note and introduction, but found he was already in advance of manufacturers in the old world, in some respects. The articles manufactured are Saleratus, Bi-Carbonate of Soda, Sal Soda, Cream Tartar, &c., and their reputation is such that they sell readily throughout the country, thus constantly increasing the demand through the orders of dealers.

EXPLORATION OF THE UNKNOWN REGIONS OF THE NORTHWEST.—The Common Council of the city of St. Paul have passed a resolution providing for the fitting out of a party of exploration to traverse the unknown regions between the boundary line of Minnesota and British Columbia. The party is to journey under the command of General S. B. Olmstead of Fort Ripley, and Col. Wm. H. Nobles of St. Paul. The expedition is to penetrate the unbroken forests of the Red River of the North, explore the sources of the Columbia River, and the region occupied by the Kutenai Indians, and return to Minnesota by the way of the Lewis & Clark pass, the falls of the Missouri, and the valley of Milk River.

THE DIVISION OF CALIFORNIA.—The telegraph brings information that a bill for the division of the State of California has passed both branches of the Legislature, and gone to the Governor for his signature. This bill is entitled "An Act for granting the consent of the Legislature to the formation of a different Government for the Southern counties of the State," and undoubtedly looks to the erection of a territory thus set off, into an independent State. The name proposed to be given to it is the Territory of Colorado.

THE PIKE'S PEAK EMIGRATION.—Advices at St. Louis on 10th inst., from Pike's Peak give very discouraging accounts of matters in that region. Large numbers of miners were returning without the means of subsistence on the way back, and it is feared that many will die from starvation. Apprehensions were also entertained that they would attack the outgoing trains.

Personal and Political.

PROF. OLMSTED expired at his residence in New Haven on the 13th inst., aged 63 years. He graduated at Yale College in 1813, was elected Professor of Chemistry of North Carolina in 1816, and served ten years. When there he made a geographical survey of that State, the first State survey made in this country; and in 1825 he was elected Professor of Mathematics and Natural Philosophy in Yale College, which post he filled at the time of his death.

But a short time since we announced the death of Dr. George Abbott, American Vice Consul at Cairo; and we now learn of the death of the elder brother, Dr. Henry Abbott, the well known collector of Egyptian antiquities, and for nearly thirty years the only resident English physician in Cairo.

Ex-Gov. KENT, of Maine, has been appointed Justice of the Supreme Judicial Court of that State.

The Republicans of Minnesota have called their State Convention at St. Paul on the 20th of July to nominate State Officers and Congressmen.

The Cincinnati Gazette says the talk about Guthrie for the next Presidency has nearly died out in Kentucky, and Vice-President Breckenridge is now the cry. The latter, remarks the Gazette, will undoubtedly be the man of the Southern Democracy.

The telegraph informs us that D. A. Smalley, of Vermont, the Chairman of the National Central Democratic Committee, is now in Washington, conferring as to a compromise of the difficulties between the Douglas and Buchanan wings of the Democracy, and perhaps in reference to the delegates to the Charleston Convention.

The Washington correspondent of the New York Tribune says that Mr. Slidell is laying his wires for the nomination at Charleston, having a perfect understanding with Mr. Bright, to the effect that their interests are in no event to clash, and are to be combined, according to the necessities which may arise.

A select party of the hard shell Democracy met at the Astor House, New York city, on the 12th inst., to devise some plan to reunite the Democracy of the State. A communication was addressed to the State Central Committee, couched in becoming terms, proposing a basis of union by which the edict of proscription, issued by the last State Convention, should be recalled. The offices are to be divided next fall, and the delegates to the Charleston Convention appointed between the softs and hards according to their relative strength in the State.

THE LAST FILLIBUSTERING EXPEDITION.—It will be remembered by our readers that the 1st of April last was the day appointed for the delivery of the "groaning Cubans from the Spanish yoke," and that various enterprising New Yorkers had contracted not only for the completion of the task, but also for furnishing a bran new government to the benighted residents of this "Gem of the Antilles." Something was sadly out of joint, however, and the Cubans will be compelled to submit to the burdens their masters may see fit to impose, a little longer. By the Quaker City, at New Orleans on the 4th inst., we learn that the brig African arrived at Port Au Prince, with 35 filibusters, 240 guns, and other munitions of war, having failed to land them at Nueva Grandes, Cuba. The attempt was made on the 7th ult., but the boats were swamped and the munitions in them lost. The African received \$1,000 in allowance for the service. The Spanish Consul in Hayti had notified Gen. Concha, who dispatched a war steamer to capture them. The Cahamba, at New York on the 5th inst., confirms the foregoing report, adding that one vessel was wrecked, and that the crew and filibusters were dependent upon public charity at San Domingo.

COTTON IN ALGERIA.—The Paris correspondent of the N. O. *Picayune* gives the following information touching the experiment of raising Cotton in Algeria:—"The French Government has decided that hereafter the premiums paid for the cultivation of cotton in Algeria shall be abolished. Although the Moniteur boasts that while 1,014,000 pounds of cotton was grown in Algeria in 1854, and 1,560,000 pounds in 1857, and the crop of 1858 will be still larger, there seems to be little question the experiment has proved a costly failure, and the Government regards money spent on this crop as treasure thrown away. The decree hints the Government will soon cease to buy the cotton in that Colony; at present it is under obligation to buy all the cotton raised there. Therefore, in a year or two this experiment of the French will share the fate of their other costly experiments."

FROM JAPAN.—News from Japan dated at Nagasaki on the 16th of February, has been received at New York. Tycoon, the new civil Emperor, was crowned on the 4th of last month at Jeddo. He is only 15 years old. A Japanese war steamer was to accompany the embassy for Washington as far as Panama. A fire in Jeddo had destroyed 5,000 buildings. Very important despatches from the English government had reached Nagasaki, and were at once sent on to Jeddo. Their contents were not known.

A LARGE BUSINESS.—The *Courier and Enquirer* of the 12th inst., says the transactions on the Corn Exchange yesterday footed up about 30,000 barrels of flour, 50,000 bushels of wheat, 46,000 bushels of corn, and 20,000 barrels of beef, pork, &c., to the value in all of at least \$600,000. This for the season, when stocks and receipts of breadstuffs are much smaller than at other periods of the year, is a very large business.

PLENTY OF WINE.—The Cincinnati Gazette says that in Longworth's Wine House there is wine enough, of last year's growth, to fill ninety thousand bottles. The entire amount of wine on hand is estimated at upwards of 310,000 bottles.

THE EARTHQUAKE.—"No Great Shakes After All."—It is now said by a journal published near Quito, in South America, that only ten persons lost their lives by the late earthquake in that city. It had been reported that 3,000 were destroyed.

News Paragraphs.

Among the quotations in the Liverpool market range on the 30th ult., was an advance of fifty to seventy cents in the price of saltpetre. Could anything be more significant of war than this simple statement.

The cronauts are going to meet in New York to consider the various plans for crossing the Atlantic, a thing that several of them are confident can be done. Mr. Wise intends to try the voyage from St. Louis to New York in the course of the season.

MAJOR KEARNEY, of New York, who took a prominent part in the war with Mexico, it is rumored, has entered the staff of one of the French Generals as a volunteer.

Letters from abroad report that the agitation which has been going on in Europe for the last three months has produced at least one good result. During that period the people have enjoyed more liberty of discussion, and have probably learned more, than during the preceding ten years. Through journals and pamphlets appeals have been made and heard.

The Province of Nova Scotia is following out the reform begun in Canada, and has decided to adopt the decimal system of currency. The system is to go into operation December 21, 1860.

New York is an enterprising village. In August last—nearly a year ago—the City Hall was partially destroyed by a fire, caused by the fire-works used during the Atlantic Cable festivities, but so queerly are things managed by the Gothamite officials, the building has not been repaired to this day, notwithstanding the rain pours down through the roof at every storm.

Town of Nelson, N. H., containing a population of about 650, has made fourteen and a half tons of maple sugar the present season. The number of trees tapped was 10,859; the number of trees in the town suitable for tapping, which were not tapped, is 10,333.

The Austrian Government has had under discussion an edict that no Christian should be allowed to remain in the service of a Jew. Whereupon the Jews resolved that if this edict passed no Jew should discount Austrian paper. This was more than Austria expected. She therefore discarded the exclusive idea on her part, to enjoy the coveted privilege of still borrowing money from the Jews! Mammon forever!

Work on the People's College is progressing finely; the work in the brick yard has also been resumed; all is bustle and stir about the College buildings. We understand that it is the intention of the Trustees to have the building up and enclosed this season. So says the Havana Journal.

MANY Italians have left, and others are about leaving this country, to take part in the threatened struggle on the soil of their native land. They hope that, in the strife, something favorable to Freedom may "turn up." But how, when, or where, is not so clear.

It has been ascertained by careful investigation into the influence of marriages of consanguinity of offspring, that over ten per cent. of the blind, and nearly fifteen per cent. of the idiotic in the various State institutions, for the treatment of their defects, are offspring of kindred parents. And making an estimate based on the best ascertained data, there would be found in the twenty millions of white inhabitants in the United States, six thousand three hundred and twenty-one marriages of cousins, giving birth to three thousand nine hundred and nine deaf and dumb, blind, idiotic and insane.

The death of M. de Tocqueville, already more than once prematurely announced, is now unhappily a fact only too well established. The celebrated author of *La Democratie en Amerique*, died at Cannes, on the 16th ult., at the age of 54 years.

The Savannah Republican says 1,344 tons of guano have been transported to the interior of that State over the railroads, for the four months ending 31st March. The Republican says the older portions of Georgia are more thrifty and productive, at this time, than they were 20 years ago.

The accumulation of smoke in the atmosphere of Cincinnati so perpetually obscures the heavens from view, that Prof. Mitchell has urged the removal of the Astronomical Observatory. The recommendation will be carried out.

PETerson's Detector warns persons who are compelled to handle bank notes, not to wet their thumbs while counting the bills. It marks that if the thumb comes in contact with the tongue after handling a note from the pocket of a man infected with the small pox, the infection is as sure to take effect as the inoculation of a child.

From the Pacific Side.

The steamship Star of the West arrived at New York on the 14th inst., from Aspinwall with California mails and dates of April 20th. She left Aspinwall the 4th, and touched at Havana the 9th. She brings nearly \$1,500,000 in specie. She left at Aspinwall the frigate Roanoke.

She reports a rumor at Acapulco—her dates probably not so late as already received via Vera Cruz—that the Liberals had taken all of the city of Mexico, excepting the Palace.

The overland mail of March 28th, arrived at San Jose, April 19th. All of the California news of interest has been anticipated via New Orleans.

The San Francisco markets are dull and glutted with Eastern produce. A large number of auction sales of assorted dry goods, boots and shoes, and groceries, had taken place during the fortnight. Money market easy and active.

Mining reports continue promising. Weather favorable for both agriculture and mining.

Advices from the Isthmus are unimportant. The Panama Star says the Cass-Herran treaty, sent from Washington to Bogota for ratification, had been lost in the Magdalena River by the capsizing of the boat.

The French brig *Lydis*, from Bordeaux for Carthage, was lost near the latter place, April 11th. There are no later dates from South America than those brought by the Northern Light.

The News Condenser.

- There are 29,000 post-offices in the United States.
- The principal stores in Philadelphia are closed at 5 o'clock P. M.
- The water celebration in Brooklyn cost that city over \$10,000.
- Massachusetts Bay is reported to be full of hump-back whales.
- Immense flocks of wild pigeons pass southward near Chicago.
- Prof. Morse and family have returned to New York from Porto Rico.
- A New Orleans editor had green corn for his dinner on Monday week.
- Sir Edward Bulwer Lytton, the Novelist and Cabinet Minister, is very ill.
- A French writer estimates the whole number of vessels afloat at 129,948.
- Walker, "the gray-eyed man of destiny," is residing quietly at San Francisco.
- A halibut, weighing 475 pounds, was caught off Point Judith, on Sunday week.
- The chain cables of the steamship *Great Eastern* weigh seventy pounds per link.
- The Philadelphia Tract Society distributed 1,659,944 pages of tracts the past year.
- Bishop Davis, of South Carolina, has, it is stated, almost entirely lost his eye-sight.
- The Peoples' line of boats carry flour from Albany to New York for eight cents a barrel.
- Grace Church, Providence, R. I., was commenced 13 years ago, and is not yet finished.
- A law abolishing the office of crier in the courts has gone into effect in Massachusetts.
- Geo. Roberts' and Park Benjamin's Constellation newspaper in New York, has "gone out."
- The "Prairie Chicken" is the name of a newspaper recently started in a town Out West.
- Paul Morphy, the renowned chess player, arrived in the *Persea*, and is stopping in New York.
- The census to be taken next year will show the population of the U. S. to be over 30,000,000.
- Fifty-one new counterfeits, on different banks, have been put in circulation since the 1st of April.
- The Emperor Napoleon III., having been born on the 20th April, 1808, has completed his 51st year.
- It cost the city of Albany last year to sustain their municipal government the round sum of \$306,552.
- There is to be a grand celebration of the completion of the Victoria Bridge, at Montreal, in October.
- Dr. Henry Miller, of Ky., is elected President of the American Medical Association for the ensuing year.
- At Petersburg, Va., last week, a party of factory girls administered an unmerciful thrashing to a libertine.
- The Kent (Md.) News states that at least one-half of the peach crop in that county has been destroyed by frost.
- It is computed that not much less than a hundred thousand pounds of sugar will be made in Liberia this year.
- A factory for the manufacture of tapestry carpets is about to be established at Cohoes by Albany capitalists.
- The Milwaukee Sentinel says that 85,000 barrels of lager beer and ale are manufactured in that city annually.
- The Legislature of California has resolved to have the laws of the State translated into the Spanish language.
- Major General Sir Fenwick Williams, Bart., of Kars, is appointed Commander-in-chief of the forces in Canada.
- Commander J. B. Paine, of the United States Navy, died at his residence in Portland on Monday week, aged 60 years.
- Bishop Cobb, of Ala., has sent to the county treasurer at Huntsville, \$950 handed him by a thief at the confessional.
- The Prussian frigate *Gedon*, which has arrived at Norfolk, Va., has on board 600 men and officers, including a prince.
- St. Louis now claims a population of 100,000, by actual count, and that the census of 1850 will credit her with 225,000.
- In one part of London, people live in the proportion of 248,000 per square mile; and in a part of Liverpool 460,000.
- Five car loads of English converts to Mormonism passed West the other night, on the emigrant train, bound for Salt Lake.
- The Milwaukee Sentinel chronicles the arrival of passengers in that city in forty hours from New York,—the quickest time yet.
- At the New Tyne Docks, in England, a steamer was recently loaded with 400 tons of coal and trimmed for sea in 65 minutes.
- In 1814 there were but 11 weekly papers in Connecticut—no dailies, of course. There are now some 40 weeklies and 14 dailies.
- A little son of J. B. Chase, of Albany, Wis., died on Saturday week, from the effects of a pumpkin seed lodging in his windpipe.
- Two well known Canadian nabobs are up for Parliament in England, Sir Allan McNab and Judge Halliburton (Sam Black).
- Souloque's prime Minister is said to have cheated the ex-Emperor out of his ill-gotten money, and is enjoying it at present in Paris.
- Some 80 young Germans have left Cincinnati for the father-land, intending to enlist in the service of Austria, out of dislike to Napoleon.
- The statistics of Ohio for 1853 show the number of suicides in that State to have been 60 in all, or one in every 40,000 of the population.
- Death-bed bequests are not valid in Canada. Bequests, to be valid, must be made six months at least before the death of the testator.
- Every person who smokes in the streets of Salem, Mass., renders himself liable to a fine of \$8. The authorities are enforcing the law.
- Collantes, Spanish ex-Minister of Public Works, has been impeached by the Cortes for having, in 1854, defrauded the Treasury of \$50,000.
- Among the passengers for Europe in the steamer *Africa*, which sailed on Wednesday, was Chevalier Hulsemann, the Austrian Minister.
- Barbers complain that the prevailing custom of wearing all the hair that will grow on the face has decreased their business at least 10 per cent.
- Mr. Wheeler Green, of Ashley Falls, Mass., over 100 years old, has recently married Mrs. Schenckhorn, of Norfolk, Conn., over 50. A "love match."
- In Cincinnati they have introduced a plan of making the inmates of the city prison earn their bread. A large number are at work in the stone quarries.

Old World Matters.

At time of writing, (Monday A. M.), we are with our foreign intelligence that can be called later than that was given *RURAL* readers in our last issue. The news by the *Paris*, however, (of which we give a transcript,) is more explicit than that already published. Two or three steamers are now due, and the probabilities are that something of a definite character, concerning the movements of the belligerent parties, will be received ere we close for the press.

GREAT BRITAIN.—It is said that the French and Russian Governments have lately been procuring large supplies of charts and surveys of the English coast and the English stations in the Mediterranean, and have likewise been engaged making large purchases of coal, irrespective of price or quality.

It is also intimated that an extensive order for charts had been received from the Spanish Government, and the inference was that Spain would throw herself into the arms of France.

The quarterly returns of emigration from Liverpool show great activity in the movement towards the United States, and it was believed that the next four months' emigration would be the largest experienced for several years.

The *Herald* says, speaking of the English mediation, that further attempts appear useless. The French, it believes, are anxious to re-open negotiations by means of conference between England, Prussia and Russia, to be held during a sort of armistice between the actual litigants.

The *Times*, re-uttering its previous statement, says the advance post of the Austrian army crossed the Ticino on the 26th, and would take position on the enemy's territory; and the main army crossed on the 29th. By all accounts the Austrians had determined on a vigorous movement, and there can be but little doubt the Austrians are desirous of striking a blow before the French troops can reach them.

FRANCE.—Paris is in a high state of excitement. The French were unprepared for the sudden movements, they expecting to begin war at their leisure, somewhere about the end of May.

The Ministry of Police is to be re-established after the fashion of the first Emperor.

Eight steam frigates filled with troops, left Toulon on the 26th for Genoa, Genoa is to be occupied as the basis of operations, whence they can threaten the Austrian's left flank, and there is to be another basis at Lusa, which will also be fortified and made a general depot for the troops that arrive through the Alpine pass.

The French troops experienced some difficulty in crossing Mount Cenis. Forty thousand workmen were employed in clearing off immense masses of snow. It was expected by the end of the week there would be eighty thousand French troops in Italy.

SARDINIA.—The following is the summary of the King of Sardinia's proclamation to the army:—The King regards the demand to disarm as an outrage on himself and the nation, and has therefore refused the demand with disdain and scorn. The King calls to mind Italy's cry of anguish, and says, I will be your Captain. I have proved your valor on the field of battle by the side of my illustrious father. This time you will have for your comrades the gallant French soldiers, your companions on the Cherneya, whom the Emperor has sent to support and defend our just and civilizing cause.—Forward to victory! Let our banners announce to you that our object, like our war cry, is Independence of Italy!

The Universities of Piedmont had been closed by royal decree.

The Sardinians had retired from Palasia to the west bank of the Sesia. The great mass of the army, 75,000 strong, was concentrated around the fortresses of Alessandria and Casale, with a second line at the foot of the Apennines, between Novara and Tortona.

The Turin correspondent of the *Times* does not think the Austrians will reach the Capital. The country has been laid under water, by means of the canals of Cygag, and measures have been taken to render the roads temporarily impassable.

THE BOUNDARY LINE DISPUTE WITH GREAT BRITAIN.—A correspondent of the National Intelligence, who is connected with the public service in Washington Territory, says that the islands in dispute with Great Britain, on the northwest coast and near Vancouver's Island, are 15 or 20 in number, and of great military importance, and declares that the boundary line claimed by the Americans is the natural and obvious one, and that it is the one contemplated at the time of the treaty, although not named. The National Intelligence coincides with the opinion of its correspondent, deeming the American view of the question as correct, and that of the British officials as presumptuous.

WM. S. GRANT, Esq., of Farmington, Maine, who was a short time since at Pike's Peak, sends word to a company at Gardiner and Farmington, not to come out there, as the bubble has exploded.

EXPORTS OF BRISTOL FROM THE UNITED STATES.—The following from the New York Shipping List shows the export of Bristol from the United States to Great Britain and Ireland, since last Sept., 1859:

		Flour,	Meat,	Wheat,	Corn,
		bush.	bush.	bush.	bush.
New York	May 10	78.38		20.855	28.267
New York	Apr 10	2.905		18.882	2.500

MOORE'S RURAL NEW-YORKER,
AN ORIGINAL WEEKLY
RURAL, LITERARY AND FAMILY NEWSPAPER.
CONDUCTED BY D. D. T. MOORE,
With an Able Corps of Assistants and Contributors.

The *Rural New-Yorker* is designed to be unsurpassed in Value, Purity, Usefulness and Variety of Contents, and unique and beautiful in Appearance. Its Conductor devotes his personal attention to the supervision of its various departments, and earnestly labors to render the *Rural* an eminently Reliable Guide on all the important Practical, Scientific and other Subjects intimately connected with the business of those whose interests it generously advocates. It embraces more Agricultural, Horticultural, Scientific, Educational, Literary and News Matter, interspersed with appropriate and beautiful Engravings, than any other Journal—rendering it the most complete AGRICULTURAL, LITERARY AND FAMILY NEWSPAPER in America.

All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

For Terms and other particulars, see last page.

EUROPEAN WAR AND AMERICAN PRODUCE.

Europe is in commotion. The sword which scarcely three years since was returned to its scabbard is again unsheathed. Again it will cause human blood to flow in one great desolating stream, bringing darkness to thousands of hearth-stones and despair to many hearts. Again the widows' tears will fall and the orphans' cries ascend to the Lord of Sabbath. He who ruleth in the Heavens and noteth even the sparrow's fall will make requisition for this great waste of human life—this wholesale butchery. Great is the responsibility of those who are in positions to exert an influence for War or Peace, and terrible will be the condemnation of those who through ambition or a desire to tyrannize over a people compel their fellow men to turn human butchers. Happily we are far from the scene of conflict, from the glare of burning cities, the sound of the death-dealing cannon and the groans of the wounded and the dying.—Happier still that we live in a country where the will of the people is the law of the land—where no tyrant can get up battles for us to fight, or drag our sons from our doors to lay their bleaching bones on foreign fields. Let us feel grateful for the blessings of good government—swear eternal fidelity to the glorious principles of freedom—pray earnestly that the down-trodden may enjoy a like blessing, and the time soon come when "He shall judge among many people, and rebuke strong nations afar off; and they shall beat their swords into plowshares, and their spears into pruning-hooks; nation shall not lift up a sword against nation, neither shall they learn war any more; but, they shall sit, every man, under his vine and fig tree, and none shall make them afraid."

Though so far removed as to scarcely feel the evils of war in Europe, still its influence is felt by almost every one. In times of peace and plenty Europe feeds her own people. The price of produce in the principal countries of the Old World is so near that of our own that we cannot generally export with profit. Occasionally a short crop, or some other unfavorable circumstance enables us to compete successfully in the produce markets of England. But, with an European war, when a great portion of the labor is diverted from the peaceful fields of agriculture to the field of battle, when large and wasteful armies, which carry desolation in their train, are to be fed, America is depended upon to furnish the supplies. Not only do those countries actually engaged in war need supplies, but as soon as war is commenced between any two nations or even seriously anticipated, all the principal nations engage at once in the work of preparation, wages for labor advance, and much of it is diverted from agriculture. In 1856, when the Russian war was in progress, we sent to Great Britain and Ireland 800,000 barrels of flour, 7,000,000 bushels of wheat and 4,000,000 bushels of corn; to the Continent 300,000 barrels of flour, 2,000,000 bushels of wheat and 500,000 bushels of corn.—Since 1st September, 1858, to Great Britain and Ireland only 80,000 barrels of flour, 400,000 bushels of wheat and 300,000 bushels of corn; to the Continent 40,000 barrels of flour, 50,000 bushels of wheat and 20,000 bushels of corn. This extraordinary decrease in our exportations was doubtless the result of the peace which was declared in 1856. The recent announcement that war had been declared between France and Austria at once caused all kinds of provisions to advance rapidly. This

is in a great measure speculative, of course, in anticipation of a foreign demand, and not the result of a demand actually made, but if the war continues, there can be no doubt that Europe will furnish a good market for all the surplus food we can produce, and at high rates.

We will not speculate as to the probable duration or the result of this war, but a thought or two may not be amiss. Austria is one of the most powerful nations of Europe, and having taken her present course, to retreat without disgrace will be difficult, and the terms she submits to Sardinia are so degrading that we think they never will be complied with by either that nation or France. Napoleon is, no doubt, anxious to prove himself a Napoleon on the field of battle. Defeat would insure his overthrow, for the French people would never submit to be ruled by a Napoleon who had been defeated by Austria, or compelled to abandon the position he had taken. It seems, therefore, we may expect a protracted, desperate and bloody struggle. England is looking on, but actively preparing for war; Russia and Prussia are in a somewhat similar condition. Events will be very likely to occur to involve in the struggle one or more of these powers. But, whatever may be the duration or result of the war, we repeat, it is pretty certain, that American farmers will have all they can do to raise provisions to supply the millions of Europe; and this work will be a mutual benefit to the American producer and the European consumer.—Prices will be advanced, and the American farmer will reap the benefit, but the large supply we can furnish, if we undertake the work in earnest, will keep down prices much below what they would be if this supply withheld.

With this view of the present condition of European affairs, we urge upon all our readers the necessity of making extraordinary exertions to increase the produce of their farms the present year. We do this not only because it will pay, but because nothing but increased production will prevent very high rates and consequent suffering among the poor of our own country, if the war should prove lasting. It is not too late to plant an extra acre or two of corn, potatoes or beans; or, perhaps, what is more important, to give extra attention to that already planted. The prospect is, that extra labor may be very profitably employed in increasing crops, and that Peruvian Guano and other fertilizers which are too expensive when produce rules low, might be used to advantage in that direction.

PREPARING WOOL FOR MARKET.*

[The following valuable and seasonable article on this important subject, is from the pen of one of the pioneer farmers of Western New York—Hector Hiron-crook, Esq., of South Livonia, who has for some thirty years made Wool Growing a prominent and profitable branch of business. During the past winter we had the rare good fortune of spending a night at the hospitable homestead of Mr. H., and listening to an interesting account of his experience, in the course of which he spoke at some length on the subject of Sheep Husbandry—imparting much useful information. * It may be proper to add that Mr. H. keeps several hundred Spanish Merino Sheep—and if the hundred yearling lambs which we saw during our visit are a fair sample of the flock, (as we presume is the fact,) his reputation as a "good shepherd" is well merited. They were certainly extra, and such as would be creditable to any breeder in the land. But, in addition to giving the name of our modest friend, we are saying what, though deserved, he may not approve—and at the same time keeping our readers from his excellent article.—ED. RURAL.]

How Should Wool be Prepared for Market?

This is a very important question, both for the wool grower and manufacturer. There are three ways of doing it. The easiest and best, is that recommended a few years ago by Messrs. PARKINS & BROWN, of Ohio, of wetting the sheep and allowing them to stand in the yard until they have become warm,—when the oil becomes "soapy," requiring but little labor afterwards to wash them entirely clean, and shear in three days, or as soon as dry. Another way is to wash without the "soaking and warming" process—the way usually practiced—leaving a large proportion of oil in the fleece, and allowing them to run from one to two weeks before being sheared. The third is to shear without washing.

The wool through the country is usually bought by small speculators, or by agents of manufacturers, generally at a commission of one cent per pound, with directions to get up a lot at an average, stipulated price for each particular locality. The wool of different sections has in each a distinctive character, and is known in market as Vermont wool, Michigan wool, &c. If the buyer finds it necessary to pay one man for a bad lot ten cents a pound more than it is worth, in order to make his cent a pound, he must, as a matter of course, buy

* Republished from the *Rural New-Yorker* of May 24, 1856.

of the next, who has a choice lot in good condition, for ten cents less than it is worth, and the thing is accomplished. The manufacturer gets his wool at a price satisfactory to himself, and the buyer gets his cent a pound. The operation of this average principle affords poor encouragement for preparing a choice lot of wool for market, when \$100 from the value of every 1,000 lbs. is to be put into the pockets of another as a premium for his slovenly management.

I have no hesitation in saying that all wool growers whose clip is sufficiently large to enable them to sell directly to the manufacturer, should prepare in the way first mentioned. The washing and shearing requires less labor and time—the wool has an appearance and character of which the owner may justly be proud—and there can be no apology or reason for refusing a fair price for the clip. But for the small wool grower, who is compelled to sell to the speculator or agent, the matter is entirely different. The writer of this article, with a desire of having his wool in the best condition, and in the expectation of receiving a price that would be satisfactory, followed that method three years, when he found to his cost that, instead of having a desirable lot of wool in market, it was difficult to find a purchaser. When the buyers were scouring the country, the question was often asked them, "Have you bought H.'s wool?" Oh, no; he has a very choice lot, and it ought to bring what he asks for it—but we are not authorized to pay so high a price for any wool—and the consequence was, he has been forced to leave in the usual quantity of grease and gum to make it merchantable.

S. H. MANON, of Ohio, in an article in the April number of the *Wool Grower*, suggests the propriety of shearing without washing, on account of injury and loss of sheep sustained by him and others from its effects. No doubt the loss sustained was caused by washing, but not necessarily so. It may be accounted for in this way: being anxious to wash clean, they were kept in the water too long. Had he followed the "soaking and warming" process, the very short time required to keep them in the water would not have produced that result.

The practice of shearing in the dirt would be liable to serious objections. By many the value of sheep would be estimated by the quantity of grease and dirt they would shear—frauds and deceptions would with greater difficulty be detected—the character of American wool would be greatly depreciated, and even the extra expense for freight in transporting to market would not be a small item in the account.

But the question is—How should Wool be prepared for Market? The answer may be given—whether the method first described should be followed, or the usual way of washing and shearing, there should be uniformity in doing it in each locality depending upon the same market. As the oil cannot be taken out by the common method of washing without injury to the sheep, they may be considered clean when the water runs clear from the fleece, and should not (unless prevented by bad weather) be allowed more than six or eight days before shearing. In doing up the fleece, all the washed wool belonging to it should be rolled up in such manner as to give it the best appearance. There is no fraud in this, as it is not only expected but desired by the purchaser. The practice of using an unnecessary quantity of twine, because there is profit in it, or of rolling in manure and filth, cannot be too strongly condemned. Let there be uniformity in each locality, and a consciousness of having done it honestly, in all who prepare wool for market, and all will be right.

H. N.

DRAINING AND WIRE WORMS.—INQUIRY

EDS. RURAL:—I desire to ask, through the medium of the *Rural*, of one or more of your readers "posted" in the matter, some questions relative to draining and wire worms. Firstly, then, I am thoroughly impressed with the importance of having land well freed from surplus water, and I wish to know, from some one who has tested both, the comparative merits of stone and tile drains. Which method is preferable, all things considered? I live upon the homestead occupied by my father and grandfather, and have assisted in building several hundred rods of stone drain. Some of these drains were built twenty-five years ago, when Agricultural papers were scarcely known, and the subject of draining comparatively little thought of. Since that time we have laid more or less almost every year. Some of the first have had to be taken up and relaid, and others, though answering a very good turn, are not quite up with the spirit of the times, while others, still, (built recently) work admirably.

Now, as any one knows who has had experience in the matter, it is no small job to build a hundred

or two rods of stone drain, even when the stones are handy; I refer of course to drains with a throat. During the coming summer I propose building about one hundred rods in a field intended for seeding in the fall to Timothy, and, as stones are scarce on that field, I have thought of using tile. I would therefore like to inquire of some one experienced in the matter, as follows:

Are tile durable? Is there no danger of their dissolving? If a tile drain is properly constructed of good material, how long will it probably remain in good working condition? Will a tile drain convey surplus water readily when placed two and one-half feet below the surface, especially if the subsoil is inclined to be clayey? Some of my acquaintances lay their tile and then lay a stone throat over them, by placing a stone on each side of the tile and covering the whole with flat stones. Is this necessary? It seems very much like double work; it may pay, however. What is the comparative cost of the two kinds of drain built in the ordinary manner, supposing you have the stones on the farm, and have to haul the tile five miles? Are sole tile preferable in ordinary soil to horse-shoe? If sole tile are used, is it necessary to lay boards on the bottom in mucky land?

Secondly, I would like to know if there is any practicable method of guarding against the ravages of the wire worm? A few years since I plowed a piece of old meadow, and planted with corn; the crop was a heavy one, and I planted it again the second year. The corn came up finely, but before it had been out of the ground one week I could not find a score of thrifty spears upon an acre! Upon examination, I found that these pests were literally feasting upon the softened kernels, there being, in some instances, forty in one hill. A neighbor has had a similar experience, raising a splendid crop, and the year following having a perfect failure from the same cause. Why does this worm allow the grain to grow without molestation during the first year after an old piece is plowed, and then wage such warfare the second? Is it because while the old soil lasts he feeds upon that? Last year I planted nine acres of old meadow and pasture, and would like to plant the same piece again as I harvested over one hundred bushels of sound corn (ears) to the acre. Now, is there any method by which these marauders may be headed and the corn saved? An answer to these questions by those who know, will much oblige an old subscriber and attentive reader of the *RURAL*. J. A. T. Port Gibson, N. Y., 1859.

HOUSE BUILDING.—NO. II.

Beyond we turn our attention to the specialty which was to be the subject of this number, let us look over your plans and see if they are so complete that the building when finished will be likely to meet all your requirements and stand unshaken before intelligent criticism.

The general outline, that which gives the first impression to the mind as we approach anything, is one of the most important points, but we must leave it entirely to the taste and skill of the designer. The color is another matter of considerable consequence, and one in relation to which, let us hope, some one entirely conversant with the subject will give *RURAL* readers a chapter. The cornices, openings and trimmings are to be treated of in detail hereafter, so we will pass them by for the present and look at what a stranger would come to first—the front entrance.

Have you determined on four or five broad stone steps, a large stone platform, a pair of splendid Grecian columns of the same material, surmounted by a classical Grecian cornice, graced by ornaments few can understand or appreciate, and distinguished by names most painful to pronounce, but all made of wood on ever so cheap a scale? Let us hope for better things. Perhaps you have thought of having broader steps and a more extensive platform, a magnificent colonnade the whole width of the house, with five or six larger columns and a great pediment above all, made in imitation of stone as before, but so palpably wooden as to deceive no one but the builder? I trust not, for such things are expensive and give but little return in looks and none whatever in comfort. What is better, is a roomy porch, with seats on the side and trellis work above—a place where you can lower your umbrella in a storm without the concentrated force of a nor-wester giving you a dose of hydropathy from the eave-spout free of charge—a place where friends can wait in comfort for the door to be opened, or where you may sit in summer with your family and enjoy the evening breeze. To make all comfortable and keep out snow in the winter a temporary door may be hung on the outside. The front door will open into a vestibule or hall, if you have one, or into the living-room if you have not. I will say nothing of a parlor, as you may have acted on my suggestions and concluded to live

without one, notwithstanding the girls insisted upon having a place where they could receive their beaux in style. (This would undoubtedly be a pleasant arrangement, girls, but yet young gentle-

SECTION OF CELLAR WALL.

men, if they are happily possessed of good common sense, will enjoy visiting with the old people until an early bed time, and certainly they will lose nothing by having a good understanding with them before hand.) But, though we will waste no time upon the consideration of a special room for patients suffering from the harmless malady, love, let us inquire if you have made suitable provision for sickness of a more serious nature. If not, now is the time to remedy the oversight. To be appropriate the sick room should be susceptible of thorough ventilation, and cut off from other rooms by a narrow hall, which will allow egress at the back of the house without the necessity of passing through other rooms. Your living-room will also be benefited by such a hall, as it will give your men folks a fair chance to come in and sit down while awaiting their meals, without having to find their way through wood-house, cook-room and kitchen, which is always a source of annoyance, and often disturbs the equanimity of the presiding genius of the culinary department.

With this review of the plans in which a few of many points that always should be thought of, but seldom are, have been merely alluded to, we will leave them for alteration and correction,—for one dollar will make an alteration in a place that it would cost one hundred to make in a building.—Water table for Wood Building. Make the plan as perfect as possible, before you commence your building, and then carry it out to the letter. Do not make an alteration after that, without having the plan thoroughly revised by your draftsman. This is the only possible way of avoiding blunders.—You cannot very well commence your foundations without the assistance of your builder or superintendent, and for this office employ a mechanic, and the best one you can find, though you have to pay an extra price, for he will surely be the cheapest hand in the end. Make the excavations for the cellar and foundation walls at least six inches larger on all sides than you intend to have the walls of the building. Make trenches under the cellar walls from one to two feet deep under a drain from these to carry off the water. All buildings will settle more or less in proportion to their weight and the density of the earth beneath, and that they may settle uniformly is what should receive your particular attention. Large flat stone throughout the lower part of the wall, will insure angles laid with a proper bond, will insure what you desire one way, and a balance slope the other. [See illustration of section.] By this I mean, have the center of the foundation wall under the center of the wall or sill to be supported.—Your wall may slope on the inside three or four inches from bottom to top, and the same on the outside from bottom to surface of ground; above that it should be plumb. This, if your wall is commenced six inches larger than the building and slopes three inches, will leave a projection of three inches outside of the sill or brick wall, which should be protected by a heavy, jutting water table. A house or any other building made on this plan will not only be better, but will have some visible means of support, which adds as much to its looks as it does to the reputation of a young man in the eyes of a prospective mother-in-law. If you wish to have a dry, warm cellar, lay up a four inch brick wall inside with a space between that and the stone, commencing on a plank of some durable timber.—Old or soft brick will do for this purpose, and plas-

tering will adhere to them much better than to lath.
Hoping this will furnish as good a foundation for what remains to be said, as it will for you to build upon, we will leave the matter for another week.
J. B. S.
Tompsey, Onond. Co., N. Y., May, 1859.

HOW TO CUT DRAINS FOR BRUSH OR TILE.

EDS. RURAL:—In reply to inquiry of C. C. D., of Syracuse, I beg leave to say that my ditch is one foot wide on the top, four inches wide on the bottom, and three feet deep where the land will permit; in some flat spots I can only get it eighteen inches. My soil is a loam one foot to eighteen inches deep, on a clay subsoil. I have some portions of land composed of one foot black soil and one foot of sand on a clay subsoil. I use beech for brushing, as hard wood is the best. Pine would be very lasting, and the foliage excellent for covering the drain. Cedar is another good material. I have said my ditch was a foot wide on top, four inches on the bottom, and three feet deep. This is the way it is done:—A common spade takes out nearly a foot wide, and ten inches deep; a second spade takes out ten inches deeper, then follows the shovel to clean out the crumbs the spade has left behind. There is just room in the ditch to allow the shovel to work easily. My ditch is now twenty inches deep, and ready for the draining spade to take out 16 inches deep at a draught; this gives me a ditch 36 inches. After the draining spade follows a long handled hoe made like a scoop, seven inches long; this takes out all the crumbs and removes any small obstacle, and I am now ready for my brush or tile. A ditch thus made resembles a bottle turned bottom upwards. How does it get that shape? By this means:—The common spade makes a square cut down for twenty inches, then the draining tool, which is eighteen inches long and five inches wide at top of plate, tapering down to four inches at the point, completes the work by taking out sixteen inches of earth, allowing two inches to the tool to work easily. The cutting of this part in a peculiar manner lies in handling the draining tool in a proper way. It is not to be used like the common spade, but, being gouge-shaped, it is pressed into the earth in a diagonal manner, and draws out the earth in one solid piece, in the same way as the tool that is used in trying butter when in a firkin. It is a difficult matter to describe its operation; it must be seen in operation, and then looks simple enough.—Should any one be desirous of seeing the operation of draining, let him, without any ceremony, give me a call, and I shall be happy to show him how it is done. I have expert hands, who will soon cut out a few rods, and show the process. I reside on the plank road, two miles north of Geneva, and any one coming from a distance can make my house his home during his visit, and I can warrant him a good welcome.
W. L. LOOIE.
Wilford Farm, Seneca, N. Y., May, 1859.

P. S.—I sowed some orchard grass seed last year. This year it was the earliest out, and began to head on the 10th of this month, it then being knee high. Is not this very early? The land is drained.
W. L. L.

BRUSH DRAINS "RIGHT SIDE UP."

EDS. RURAL:—E. Bixby's publication of his experience with brush drains I fear may cause brush to fall below par, and tile to rise; but time will decide the question. My "jumping at a conclusion for sixteen years" had not for its base my solitary year's experience, but from information obtained from those who had personally known brush drains to last twenty years in England, and my poor experience of one year, enabled me to conclude I might be as successful as others who had more experience than myself. There is a right and a wrong way of doing a thing; perhaps Mr. B.'s may be the right way, and mine the wrong; time must decide that. According to E. B., he cut a ditch 3 feet wide and 15 inches deep, and put in brush 10 inches thick, leaving 8 inches clear of the brush. Now, he need not complain; I think it operated well for the time and circumstances. I should not consider this a drain; in my humble opinion it is a miniature brush-heap. A horse walking over a surface two feet wide, only eight inches of soil covering the brush, must certainly make some impression on the drain and pack it well down, particularly if the earth is in a wet state. I cannot blame any one for coming to the conclusion that brush was no good under such circumstances. I mean to stick to Mr. Brush, for he has been a good friend to me, and hope to have him in my soil for many a long year; but should he use me badly I will then "report progress" for the benefit of all concerned.

Men will have different views and opinions of matters and things. Had I the land Mr. B. describes I should treat it to an open ditch till all the surplus water was removed; then I should consider whether it was worth tiling, which I think it must be, for Mr. B. owns to one good crop under the brush-heap system. A neighbor of mine came to see my brush drains, was much pleased with them, and made many inquiries. I showed him the draining tools, and told him to get one at cost of \$1.75. He said he could do just as well with a common spade. He has since plowed and scraped out a ditch, filled in with brush, and no doubt will expect great results; but his labor will be lost, and he will be "down" on brush drains. An outlay of a few dollars would have enabled him to do the thing the right way and get good returns.

I would here remark that ditching and draining are distinct branches. You must have open ditches to carry off the floods if land lies level, as mine does, then tile underground that the remaining water may percolate through the soil and reach the drains. It is too much to expect tile to take all the water, it will take too long a time to percolate through, and the earth does not get the full benefit of the drains. I have a map of my farm with all the drains laid down, and showing the open ditches. I find it very useful. I got this idea from a sea-man's chart. I hope some day to have the pleasure of showing it to you and receiving your comments on it.
Yours respectfully,
Wilford Farm, May, 1859.
W. L. LOOIE.

HOW TO MAKE FENCE ON ROCK.

FRIEND MOORE:—C. H. De Witt, Wood Co., Ohio, wishes to know "what is the best plan to build a door-yard fence where it is impossible to set the posts in the ground on account of rock." I will give him my plan; it may not be the best, however, but such as I have I will give.

Use 4 by 4 scantling, (oak is preferable,) for the posts; length according to the height of fence desired—(mine are three feet seven inches.) Take 1/2 inch oval iron for braces; cut them from 17 to 18 inches long; let a blacksmith flatten one end, and punch a hole suitable for a 3/4 inch bolt, and bend the same as nearly as he can to the perpendicular of the post, when the brace is bent to it, which is easily done when fastened at the bottom. If the surface of the rock upon which he purposes building is level, or nearly so, and soft enough, drill a 3/4 inch hole, say 3 inches deep, in the place where the post is to be set. Take 1/2 inch round iron, cut spikes about five inches long, have them sharpened or pointed at one end, for the posts to rest upon; bore a 3/4 inch hole in the bottom of the post, deep enough to admit the spike; fasten the blunt end of the spike in the rock firmly, (which can be done by running in hot lead or driving in common cut nails at the side;) then drive the post firmly down upon the spike; then (or before if preferred,) drill another hole just the size of the brace inside of the post, far enough from the post to give the brace an angle of about forty-five degrees when bent to it; then bolt the upper end firmly to the post with a 3/4 bolt 4 1/2 inches long (being particular in fastening to the post so as to get it perpendicular.) He will then have a post, when the fence is completed, that will stand firm against the strongest winds.

I have about sixty rods of this description of fence for door-yard, garden and lanes, that has been built about three years, and stands firm as a rock. My posts are set upon rough quarry stones, averaging say nearly 18 inches long by 12 to 15 wide, and from 3 to 6 inches thick. I then believed, and am now satisfied, that it is a better way than setting the posts into the ground, as there is but little if any chance for the posts to rot, being always above the surface of the ground. The expense is but a trifle more than setting posts in the earth; the iron (here) would not cost over 4 1/2 cents per pound, and the bolts say \$3.25 per hundred. It takes less timber for posts, and not much more labor to set them. If quarry stone are used they should be bedded about half their thickness into the ground, as they will stand more firmly than on the surface.
North Rust, N. Y., May, 1859. H. B. H.

SOD FENCES.

EDS. RURAL:—Having noticed the inquiry of W. H. Chaffee, of Byron, Mich., in regard to sod fences, I would inform him, through the RURAL, that they are very common in the West, on both wet and dry land. For marsh land they are the best, as well as the cheapest, fence made. The ditches should be from five to six feet apart, and large enough to carry off the water, as they then answer the double purpose of fencing and draining the land. For land not too wet, the ditches should be four feet wide and three deep, and tapering to one foot in width at the bottom, will be found sufficient to give plenty of sod and earth to build a durable fence. The cost of double ditch of this size is about fifty cents per rod, now, but in good times seventy-five cents was the ruling price. Prairie land can be fenced by single ditch for twenty-five cents per rod, and double ditch at thirty-eight cents, and if well built is durable and needs but little repair annually.—L. H. DORSEY, Otago, Wis., May 16, 1859.

BEES AND BEE-HIVES—AGAIN.

MESSRS. EDITORS:—As the inquiries of W. G. RICHES and J. H. SMITH, in the RURAL, of April 30th, under the head of "Bees and Bee-hives," have not yet been answered, I will offer a few words on the subject. But as I shall not attempt to answer the important inquiry fully, I will proceed in that very brief and wholesale manner in which I commenced this article.

Apiaries should be so situated and constructed that the hives and bees, and the atmosphere in their immediate vicinity, may be warmed by the sun at nearly all times of day, and at all seasons of the year, and at the same time be protected as much as possible from wind and weather. I have observed that generally those who have been successful in bee-keeping, have kept them in a warm, sheltered (not shaded) situation, and that bees thus kept, in the morning in early spring, were at work long before those which were exposed to cold and upon which the sun was not admitted. As "to know the disease is half its cure," a remedy is readily suggested.

As to "which is the best plan of constructing bee-hives," I would say that I distinctly, though briefly gave my views in the RURAL of Jan. 29th, and they are unchanged. In that communication I stated that I preferred the common box-hive (not to say that it was perfect.) There is a hive made in this place named for its shape, "the No-Patent Octagon Hive." This hive has a box on the top for taking honey and for feeding bees; it is made of pine, 1 1/2 inches thick, planed and painted, and though not differing in principle from the common box-hive, its form makes it quite ornamental. Of "S. Davis' Platform Bee-hive," I have heard, but not seen, and have no more to say. And as to "which is the best book treating on bees," I have only to say, I may have been unfortunate in my selection; for, out of a large number, I have not found as valuable information on the subject as from Agricultural papers, where disputed points were replied to and fairly discussed. Something may be learned, however, from all. Not prepared to say which is best.

No one, of course, ought to object to a patent hive, if it is an improvement, but so far as my observations extend in that direction, the so-called improved bee-hives properly belong to that class of improvements, called the backward march improvements. Something of an idea of the situation of the bee, being wintered in these hives, (in which the bees are divided and subdivided, and ventilated on all sides,) may be had by imagining a swarm

being wintered in a fanning-mill with a boy to turn all the time. Some years ago I undertook to use one of these machines, (bee-hives,) the price of which was \$4.50. The first season I drove a strong swarm into it, which, after remaining a few days, came out and flew to parts unknown. The next I put a young swarm into this hive, which starved in winter with plenty of honey in a box just above them; those few that passed into this box found it so cold that they could not uncup the honey. The third year I put a small swarm into it, not thinking it a safe place for a valuable one. This swarm located themselves in the moth, at least the queen and most of the bees—a box in the lower part of the hive which would hold about ten pounds of honey, but which never did contain more than half that amount for some unknown reason. This was not far from where I came to the conclusion that the next man that sold me a dose of humbug under the name of improved bee-hives must be a resident, for at least a long time, of the land of wooden nutmegs,—and then he would not.
East Shelby, N. Y., May, 1859. I. I.

ABOUT CHINA TEA WHEAT.

I CAN say to J. J. B., of Lockport, who inquires in the RURAL of May 7th about China or Tea Wheat, that it has been grown in this vicinity for several years, and for three or four years it has been badly eaten by the midge, unless sown late.—O. D. H. East Rodman, N. Y., 1859.

MESSRS. EDS.:—In the RURAL of May 7th is an inquiry from J. J. B., Lockport, N. Y., in regard to the midge working in the China Tea Wheat. I would say, as regards this section, they worked very badly indeed last year. It has been almost the only variety sown in this section for a few years past, but a great many have changed their seed this spring, and have sown the Scotch or Rife Wheat. I think for flouring the China is ahead of any variety we have ever raised here, but it has to be cut before it is very ripe, or the first heavy wind will shell it.—T. O. W., Rutland Hills, N. Y., N. Y., 1859.

FRIEND MOORE:—J. J. B., in your issue of May 7th, wishes to know if any one ever knew the China Tea Wheat to be injured by the midge. Permit me to say for the benefit of your correspondent and all others concerned, that I, for one, have known the Tea Wheat to be injured by the midge; and I have good reason to believe that there are many more farmers in our town who can testify to the same fact. In the spring of 1858 I sowed my Tea Wheat earlier than usual, about the middle of April, and I think I can safely say that I lost one-fourth of my crop in consequence of the midge.—But the Tea Wheat sown late, say from the 12th to the 20th of May, I have never known to be injured to any extent by that little pest of an insect. Being a bearded variety it is less liable to be injured by the midge than either the club or bald variety; nevertheless, if you will sow the Tea Wheat early, and sow no Club Wheat for them to work in, I dare venture they will not hesitate to attack it.—R. W. L., Onondaga, May, 1859.

HITCHING POSTS.

HITCHING POSTS! What is there in a hitching post that is worth considering? 1st, The material. Iron is strong, durable, and can be cast in a great variety of fancy or fantastic forms. A good iron post, well masoned in, is perhaps best, yet rather expensive. Stone is expensive, is not strong, is constantly liable to get broken, and should not be used. Living trees would be good, except that there are horses that would be quite sure to girdle and destroy them the first opportunity.

A good post may be made as follows:—Take a chestnut post eight feet long and ten inches in diameter; cut a notch all around the small end, about six inches from the end. Then hew the large end from the middle of the post to the end, where it should have a diameter of about nine inches. Make a large hole four feet deep; set the post with top end down; prepared as described above; fill up the hole with stone well pounded down. Plait the top of the post over with sheet iron, and wind the upper part of it with hoop, band or sheet iron, to prevent the horses gnawing it; then trim it with a ring, hook, and a chain three feet long with a snap on each end. Fasten the chain to the post by a staple, one-third the way from one end of the chain to the other. The short end of the chain will serve for a single horse or the nearest horse in a team, and the long end will be right for the horse furthest from the post. Put two such posts six or eight feet apart, and make a platform between them from which to get into wagons, with steps to ascend to the platform from the sidewalk, and you have a very desirable accompaniment to a well appointed home. No house should be without its hitching post. And while making it, make it safe. Get a strong post, know that it is well anchored, have ring, hook, staples, chain and snaps all strong. Sham will do on fancy articles, where the appearance is all that is desired; but a hitching post with all its fixtures, which are liable to be put to the severest tests at any hour of the day, by either frantic or vicious horses, should be sound. Fences are neither safe nor cheap hitching posts. Shade trees should never be used. If you would save horses, fences, shade trees, horses, wagons, harness, and the risk of having broken bones by runaway horses, and also keep out a constant token to your friends to come and share your hospitalities, put up good and substantial hitching posts.
Binghamton, N. Y., 1859.

MAPLE SUGAR.—Twelve farmers in Greenfield, Mass., made 12,175 pounds of maple sugar the present season. The total number of trees tapped was 3,743. The greatest yield per tree was four pounds; and the smallest a trifle less than three pounds; the average was about three and a half lbs. per tree.

A NATURALIST NORTHWARD BOUND.—MR. ROBERT KENNEDY, son of Dr. J. A. KENNEDY, of Illinois, has recently started on an expedition to the Hudson Bay Territories, with the design of spending two years in the far north, on an Entomological Expedition, and to ascertain relative to the various animals inhabiting that region. He goes, we believe, under the auspices of the Smithsonian Institute.

Rural Spirit of the Press.

Burning Sods for their Ashes.

At a meeting of the Skaneateles Farmer's Club, says the Albany Cultivator, Mr. W. P. GILES gave the result of an experiment on his farm, some years ago, in burning the turf upon a piece of swampy ground which had been reclaimed by draining. The sod was cut loose in the fall, and in the spring was thrown into heaps, and burned by the aid of old rails and stumps, and the ashes were then spread as a top-dressing upon the land immediately after plowing; the result was an enormous crop of corn, while the adjacent parts of the same field were ruined by the worms. The ground continues to produce larger crops of grain and grass than any other parts of the field to this day. He also alluded to the practice of the Hon. Mr. DICKINSON, of Steuben Co., of cutting up the sod along the side of the highway, and throwing it in heaps and burning it as a manure, with beneficial results.

Sulphur for Stock.

A WRITER in the Ohio Farmer thinks that the value of Sulphur for stock is not sufficiently known, and in recounting the benefits to be derived from its use, argues as follows:—"Most farmers are well aware that there are certain seasons in the year when animals of every description on the farm—from the finest colt to the poorest calf—become afflicted with (in plain English) ticks, (one of the plagues of Egypt,) or ticks. To become free from any trouble or injuries from the attack of these pests, we have only to put sulphur in the food, or salt of stock so infested, or mix a little in lard, and rub it on the small and young animals. A speedy cure may be depended upon. I think a teaspoonful two or three times a week—four or five times a year—will generally keep hogs and sheep entirely free from such vermin. The above article is more particularly applicable to sheep and hogs. It has been said, and I believe, with some show of truth, that, given plentifully at the beginning of warm weather, as above directed, every other week, till shearing time, it opens the pores of the skin, curing cough, and whitening the wool; and as evidence of which, look at the big snow white sheep on the mountains of Virginia, in the vicinity of the sulphur springs."

Black Leg in Calves.

This disease is prevailing to some extent in Ohio, and a correspondent of the Ohio Cultivator writes that journal as follows:—"Black Leg first makes its appearance on the inside of the hind leg of the calf, about two or three inches above the hoof, in the form of a small scab. Sometimes this scab will increase in size, and sometimes not. I have known calves to die with it, when the scab was no larger than a five cent piece, and at other times I have seen it spread over the whole surface of the leg. If my observations be correct, I believe the disease is more fatal when the scab is of a small size, for this indicates an inward working of the destroyer. But if the sore or scab be large, and matures freely, there are some hopes that the disease is of a superficial nature. That this deadly dealing disease may be stayed in its course, I would advise those who have any of this afflicted class of stock to watch them with a careful eye, and as soon as the disease makes its appearance, remove the scab, and with a sharp knife lay open the leg about an inch above and below the sore, cutting immediately through it, and if possible to the bone, which is no difficult task, as the bone lies near the surface in this part. If the orifice should close too soon, it should be opened again, and kept open for several days, or until the calf is out of danger. If the weather be dry, or the calves have good shelter, it would be well to mix a small quantity of sulphur with their salt, as it would have a tendency to purify their blood."

Good and Bad Farming.

ONE of the contributors to the American Farmer's Magazine gives us his views upon this subject in the following manner:—"If there be what our title indicates, then there are both good and bad farmers. Did the earth bring forth spontaneously, in all latitudes and localities, then there would be no occasion to speak of good farming and bad farming, nor of good farmers and bad farmers, for there would be nothing to do but to gather the spontaneous productions of the earth. But this is not so; for it has been decreed to man, that by the sweat of his face he should eat bread. This implies labor, whose application and direction constitutes the principal difference between good and bad farming. For the same sun shines, the same dews distil, the same showers descend, the same breezes sweep over the plains of the bad farmer that do over the acres of the good. The latter is diligent, methodical, skillful, and enterprising, while the former is wanting in all these, and more, for he is the slothful man, whose portrait is so vividly drawn in an old oriental volume well known to our readers. The good farmer takes care to have plenty of forage, for without forage he can keep no cattle, no horses, no cows. Grass lands, both for hay and pastures, are indispensable; and root crops are also essential to aid in feeding live stock. Besides these, wheat, barley, buckwheat, oats, rye, and corn, must be produced to feed and sustain man."

But, says the bad farmer, wealth is the secret of success with my neighbor, the good farmer. He has inherited money, or else has made it in other business, and can therefore outdo one who has inherited nothing and made nothing but what he has got off from the farm. This may be true in your case, while it may be also with many well-to-do farmers. Remember, it is good farming that pays. Bad never does. So far is it from this, that it not only fails to pay, but impoverishes him who is engaged in it. No man can afford to raise seven bushels of rye per acre, or ten bushels of wheat, fifteen of oats or barley, twenty of corn, &c., while good farmers produce of wheat and rye each from thirty to sixty bushels per acre, eighty of oats, and seventy-five to one hundred of corn, and two or three hundred of potatoes. No wonder that bad farming leads ultimately to the abandonment of the business, because it does not pay. True, it does not pay, never did for any length of time, and never will. There are no more independent people in the world than good farmers, and few more miserable, dependent, and wretched, than bad farmers. It is the purpose of every philanthropic man, and more especially it is so with those who conduct the press, to greatly multiply the former class by diminishing the latter. Then shall good farming be the rule, and bad farming the exception. May the day be hastened when this shall be verified."

Agricultural Miscellany.

THE DEVON HEAD BOOK—American edition, 2d volume, by SANFORD HOWARD—will be issued soon.

THE SENECA CO. FAIR is to be held at Waterloo, Oct. 12th, 13th and 14th.

THE ANNUAL FAIR of the Jefferson Co. Ag. Society is to be held at Watertown, Sept. 21st and 22d.

THE ANNUAL FLOWING MATCH of the Livingston Co. Agricultural Society is to be held at Avon on the 9th of June.

MR. E. MARKS, of Camillus, N. Y., has recently sold the imported Short-horn bull "Marquis of Carrabas" (11789) to WM. BORM, Esq., Cortlandville, N. Y. This noted animal is said to be lively and vigorous, yet perfectly docile.

WOMAN AS A FARMER.—A southern paper states that the most extensive plantation in Louisiana is managed by a woman—Mrs. A. E. FLEET. During the last year she raised 1,800 hogheads of molasses and 400 bales of cotton—the largest crop produced on any plantation in that State.

NEW HORSE TRACK PROPOSED.—A gentleman of Hartford, Ct., suggests a new form of "track" for the exhibition of horses. His idea is to make it in the shape of an elongated figure 8, so that as the track crosses the intersection or middle of the figure, neither horse can get the advantage of the shorter or inside track.

TENTS AND FLAGS FOR AG. FAIRS, &c.—In answer to several recent inquiries, and for the benefit of officers of Agricultural Societies and others interested, we would state that Mr. JAMES FIELD, of this city, can accommodate those who wish to rent or purchase tents and flags for use at Fairs, Encampments, &c. See his announcement in our advertising department.

WEATHER, CROPS, &c.—The weather has been quite cool since our last—with a hail storm on Saturday and a slight frost on Sunday night, though no material injury was caused by either. The weather is now (24th) warm and pleasant again. The growing wheat, spring crops, grass and fruit (except peaches) look remarkably fine, and promise well for the season. Our advice from the West, and other parts of the Union, are generally most encouraging in regard to crops.

FAWKES' STEAM PLOW.—Writing to the Prairie Farmer Mr. FAWKES says he has tried his new plow and it works satisfactorily—is much pleased with the improvements, and believes he is able to compete with the world. After exhibiting his plow in Philadelphia and Lancaster, Pa., Mr. F. will ship his machine to McLean Co., Ill., where he has contracted to break prairie, and purposes to compete for the liberal premiums offered by the State Ag. Society.

MUTTON SHEEP FOR TEXAS.—A New York city paper says Mr. LELAND, of the Metropolitan Hotel, recently shipped forty pure blood Southdown and Leicester sheep to his brother in Texas, intended to improve the breed upon a large sheep farm or "ranch," and adds: "When shall we have fresh, fat Southdown mutton from Texas served up daily upon our hotel tables? For to that complexion, we suppose, we shall come at last. We have had fresh mutton in this city from Algeria, in Africa, and by the same process of preservation we can certainly have it from Texas."

GONE TO EUROPE.—We have neglected to state that LUTHER H. TUCKER, Esq., Junior editor of the Country Gentleman, is spending the Summer in Europe—having sailed on the 23d ult. Also, that SANFORD HOWARD, Esq., of the Boston Cultivator, was prevented from leaving for Europe on the 4th inst., as announced, on account of severe illness. We are glad to learn, however, that Mr. H. soon recovered, and sailed on the 18th. We trust our friends will have a pleasant and profitable season abroad—steer clear of the "grand armies" and fighting generally—and return to home and friends in health and safety.

EARLY WINTER WHEAT.—An enterprising farmer of Holley, Orleans Co., Mr. NELSON HAYTON, writes:—"On the 8th day of Sept. last, I planted a small piece of early wheat as an experiment. It wintered well, now stands 3 feet 6 inches high, and this 21st day of May is headed out,—while Mediterranean, sown on the same land and fifteen days earlier, is not as high, and judging from appearances will not head in ten or fifteen days. If this wheat proves what it now promises of doing, and should be thought worthy of notice, I will advise RURAL readers of its yield, quality and other particulars not here mentioned."

HAY CAPS WANTED.—A subscriber at Middleville, N. Y., asks us to inform him, through the RURAL, "if there are any manufacturers of hay caps, and if so of what sizes and prices? Are they without a seam, and are they called or pointed, or both?" Hay caps are manufactured somewhat extensively in Boston, but we cannot answer definitely as to sizes, prices, &c. We believe they are from 1 1/2 to 2 yards square, made of sheeting and drilling, and cost from 80 to 62 cents each. Can any of our readers answer as to the cost and utility of hay caps from practical experience?

HOW TO "HEAD" THE CROWS.—MR. H. O. GREGORY, of Lockport, who evidently does not consider crows very valuable, thus tells us how he prevented them from pulling up his corn:—"Having seen many scarecrows in newspapers and cornfields, I want to tell you how I managed last year. Obtained a shilling's worth of strychnine, dissolved it in about two quarts of warm water, and soaked some corn in the water over night. Early in the morning I scattered the corn in the most exposed portions of the cornfield. Such a caw-cawing as there was among the crows a little after sunrise I never before heard. Happening to be in an adjoining piece of woods a few days after, I picked up about twenty dead crows, and after that there was not a crow seen on that cornfield, nor scarcely any in the neighborhood during the summer."

THE RURAL APPRECIATED.—We are in daily receipt of letters speaking in the most appreciative terms of the RURAL, but rarely publish any of them. For example, this morning (May 21st) received, among others, three epistles from which we will quote in the order in which they were opened. No. 1 is from Newark, N. J., and says:—"Having one of your RURALS before me, and it being, according to my knowledge, the best paper devoted to Agriculture, Rural Life, Literature, Science, &c., I am desirous of taking it for at least six months, and therefore inclose \$1." No. 2, from Rome, N. Y., says:—"I have taken the RURAL about four years, and am very well pleased with the paper, and shall continue it as long as it bears its present reputation." The third is from Esopus, Ulster Co., N. Y., and reads thus:—"I send you \$2 for the RURAL one year. I have been a reader of its pages for six months, and find it the most valuable in the Agricultural newspaper line. I have found several articles in it, each of which was worth the price of a whole volume."

HORTICULTURAL

CURRANT AND GOOSEBERRY CATERPILLAR.

So numerous and pressing are the inquiries, as to what can be done to rid the currant and gooseberry bushes of the caterpillars with which they are now infested, threatening not only the destruction of the leaves and the present crop of fruit, but the plants themselves, that we devote considerable space to this subject, although treated of pretty fully about one year since. These pests have been rapidly increasing for the past two or three years, and now in this section, nothing but the most untiring vigilance will secure a crop of fruit, or save the plants from ruin. The engraving and description of the Currant Moth is from Dr. Firca.

THE CURRANT MOTH.

Soon after the middle of May, when the currant bushes have become well clothed with leaves, and have fully put forth their flowers, a worm appears upon them, feeding upon the leaves. The worm is so small and so much concealed among the foliage, that it is never observed, until it has increased considerably in size. In almost all gardens it is so abundant during the last week in May, that it may readily be found. It is at this time a quarter of an inch or more in length, and about the diameter of a coarse knitting-needle. It is of a lively, light-yellow color, and thickly covered with numerous black dots of different sizes, most of which, when closely examined, are discovered to be symmetrically arranged, and forming rows lengthwise of the insect. It continues to feed, and to increase in size, until near the middle of June, when being fully grown, it is almost or quite seven-eighths of an inch long, and one-eighth of an inch in diameter. It moves by arching its back upwards, and spanning off a particular space at each step. It is rather sluggish and inactive during the day time, if undisturbed; and if obliged to migrate from one bush to another in pursuit of a more abundant supply of food, the journey appears to be performed by night.

Like other geometridian larvae, this may frequently be observed with its hind feet firmly attached to a branch, and its body extended stiffly outwards, sometimes in one posture, sometimes in another. It thus often presents a most grotesque appearance, as it remains for hours rigidly fixed and motionless, as though it was a withering twig dotted over with lichens, or some other natural appendage of the plant.

Though the chief supply of food for this insect is furnished by the currant bushes, it with equal avidity devours the leaves of the gooseberry wherever these occur within its reach. And it not only consumes the leaves of these shrubs, but it nibbles the peduncles or stems which bear the fruit, wounding them to such a degree that they perish, and the fruit withers whilst it is yet but half matured.

Having completed its growth the worm descends to the ground, and burying itself slightly under the surface, changes to a pupa of a shining black color, about thrice as long as it is broad, and measuring about half an inch in length. These pupae may be found in abundance in the earth directly under the leafless currant and gooseberry bushes, about the middle of June. They are not enclosed in cocoons, nor surrounded with any other covering, but lie naked, in contact with the earth. In this state it continues but a few days, when the hard outer shell cracks asunder, and the perfect insect crawls from it and readily works its way out of the loose loamy soil in which it is buried.

The winged moth may be met with from the middle of June till after the middle of July. During the day time, with its wings fully spread, it remains at rest, concealed among the foliage of the shrubbery and vegetables of the garden and its confines. As dusk approaches, it commences flitting about, and is most active in the evening. It suddenly takes wing, flies rapidly a few yards, and then suddenly drops amid the grass or foliage and disappears from view. Like many other moths, it is attracted by the light of a candle, and hence frequently enters the opened windows of dwellings in the evening. The exact situation in which it deposits its eggs, I have not yet discovered. These remain, it is probable, during the autumn and winter, to hatch and produce another generation of worms the following May.

This insect is so closely related to the Gooseberry Moth of Europe, that we may confidently infer that those measures only which have been found efficacious for checking the ravages of that species, can be of material avail against this. Numerous remedies have there been resorted to; such as sifting the fine dust of soot, of ashes, &c., repeatedly over the bushes; sprinkling with lime-water, or with decoctions of tobacco, of fox-glove, of elder, &c.; by successive shakes of the bushes, causing all the worms to descend to the ground, and then tying cabbage leaves around the base of the stalks, over which it was reported the worms would not crawl to re-ascend. But none of these remedies have established themselves in public favor; and the only measure which is recommended with confidence, by all the more intelligent writers, is that of "hand-picking," as it is termed. This, though tedious, is said to be, in the end, the most economical of any measure known, and the only one on which full reliance can be placed. It is commonly accomplished by suddenly jarring the bush, and then with a forked stick or some similar implement, gathering those worms that have let themselves down by threads, and crushing them beneath the foot. This process requires to be repeated three or more times to free a bush from the worms, as but part of them let themselves down on the first agitation.

This remedy should be resorted to with our insect, as soon as the young worms are discovered upon the bushes, and if perseveringly followed up, will, no doubt, be effectual. The task, however, will be a formidable one, to thus free a garden of the countless numbers of these larvae by which it

THE CURRANT MOTH.

Fig. 1, The Male Moth. 2, Female. 3, Larva—lateral view. 4, Larva—dorsal view.

is infested; and the measure can only be resorted to with facility in those gardens where the bushes are kept well thinned by pruning.

A less laborious mode of reducing the numbers of our moth in badly infested gardens, it strikes me is so feasible that some may be disposed to test its efficacy by giving it a trial. As already stated, the worms having completed their growth, bury themselves slightly in the ground under the bushes, where they lie several days in their pupa state, and then the winged moths come from these pupae and make their way out of the ground. Now if the surface of the earth beneath currant and gooseberry bushes be leveled and made smooth with a rake, it will be but a slight labor, when the worms have mostly left the bushes and buried themselves, to closely cover the ground beneath and around the bushes with boards, or pave it with bricks, should these be at hand, allowing this covering to remain three or four weeks. The winged moths on coming from their pupa shells, would probably then be unable to make their way into the air, and would perish in their confinement. The efficacy of this measure would be indicated, on removing the boards, by the numbers of dead moths on the surface of the ground beneath them.

GOOSEBERRY SAW FLY.

It is only two years since our attention was first attracted to this insect. How long ago it was first seen in this country, or whether it is a native or an emigrant, we cannot say. But of the fact of its having taken almost entire possession of our Gooseberry and Currant bushes, and of its very close resemblance to the *Gooseberry Saw Fly* of Europe, there can be no doubt. It first attacks the gooseberry, but when these leaves become scarce those of the currant are greedily devoured.

The flies emerge from their winter quarters in the ground the latter part of April or early in May, and soon after the female begins to deposit her eggs on the under side of the newly expanded leaves, choosing the sides of the veins or nervures as a fitting place. With the saw-like appendage, for which the family is remarkable, the female commences cutting into the leaves, and in the opening deposits her egg. The larva is hatched in about a week, and commences feeding on the leaf, increasing in size and frequently changing its skin, till it is about three-quarters of an inch in length. It is now of a dull pale-green color, the first thoracic segment being deep yellow, the penultimate being also of the same color; the feet, tail and head are black, and each segment is dotted black also, some having as many as twenty-four spots arranged in lines down the back, while those on the sides are more irregular, with one large one at the base of each foot. They have six pectoral, sharp, horny feet; the fourth segment appears destitute of feet, but the six following are each furnished with a pair of legs, which assist them in walking; they have also a pair of feet at the extremity of the last segment.

GOOSEBERRY SAW FLY.

Grub, Cocoon and Perfect Insect.

In the fly state it assumes an ochraceous color; the body is orange, sometimes bright; the wings are iridescent, and, when expanded, are about two-thirds of an inch in length; the antennae are almost as long as the body, bristly, brownish above, and nine-jointed; the crown of the head and eyes are black, as are also three large confluent spots in the center of the frons, and also a large patch on the breast or sternum.

The broods of caterpillars appear in succession occasionally from March till October, but in greatest numbers in June. Sometimes they severely attack the gooseberry in July and August, and after denuding the bushes of their foliage, they descend into the earth, spinning themselves a yellowish cocoon of an elliptical form, and remain in their pupa state till the following spring. Those of the early summer brood descend in like manner but in the course of three weeks, or less, undergo their transformation, and again appear as perfect flies.

Syringing the bushes, on the first appearance of the caterpillars, until the foliage is well wetted, and then dusting them all over with powdered caustic lime, is effective. The operation should be performed at least two or three times to secure their destruction, and the earlier it is done the better.—Watering with lime-water has much the same effect, and covering the ground under the bushes with fresh tanner's bark is also advantageous. The most radical cure, however, is to remove the soil under the bushes to the depth of three inches, and to dig pits two feet deep and bury the soil in them, substituting that taken from the pits for that which has been removed. Water heated to 140 degrees, and applied by the syringe or garden engine, has been found destructive to the caterpillars, while the foliage has sustained no injury. The practice of striking the stem of the bush suddenly with a mallet, so as to cause the caterpillars to fall to the ground, where they may be bruised to death with the back of the spade or trodden under foot, is sometimes attended with much injury to the stem and bark of the tree. If the insects are not too numerous a good deal can be done by hand-picking. But, at whatever cost, these insects must be subdued or we shall have to give up the culture of the most valuable of all our small fruits.

CIRCULATION OF THE SAP.

Messrs. Editors:—As one of my sons takes the *RURAL*, I peruse its instructive columns, and occasionally meet with an article that seems to me not to be founded on true philosophy. One such article appeared in the *RURAL*, by L. BARRETT, on the circulation of the sap! A reply to this, by H. H. BARRETT, was published on the 18th ult. This reply is well written, and appears to me, with one exception, to accord with sound philosophy and the laws of vegetable growth, as now understood. The power of "capillary attraction" is considered sufficient to force the sap to the extremities of the tallest trees, and in the case of those gigantic ones of California, would seem to require a power equal to ten atmospheres, or 150 pounds to the square inch. Enormous as this seems to be, there is evidence that it is capable of such performance. In mill-stone and marble quarries, the former one of the hardest of rocks, the workmen drill holes where they wish to split them, and then drive seasoned hard-wood wedges in these holes firmly, and then, by saturating these wedges with water, they rend these rocks with great nicety and precision. Here is practical evidence of the power of capillary attraction alone, of tremendous force. This is a beautiful law of the Great Creator of matter, that enables water to enter even rocks and other substances, and under atmospheric influences to cause their destruction, and thus form soils by which organic life is supported.

The objection to this article is in the paragraph on "the downward flow of the sap;" of this I have no evidence whatever that it does exist. I am aware that I am opposing old theories—theories proclaimed in the infancy of science, when the operations of nature were but little understood; but now, when facts are required to support theories, it is found that facts do not support this. Where is any evidence that the "flow of the sap" is forced out of the substances of the leaf by the upward motion, and that thus a "circuit" is carried out and matter "finds its way to every part of the surface of the tree, where it forms wood." A little reflection, it seems to me, should convince any one that a power with force enough to drive the sap upward to the leaf, and then drive it down again to the root against the upward flow, occupying as that does every pore of the wood and bark, would burst every leaf of the tree, even if made of material strong as India rubber.

It was easy to infer, after the theory of the circulation of the blood in the animal economy became known, that a similar circulation of the sap took place in vegetables. This, however, is now seen not to be the fact. GRAY, in his Botanical Text Book, says "there is no circulation in

plants similar to that in animals." And in the *American Encyclopedia*, now in course of publication, article "Botany," the author argues against a downward flow of sap, and shows conclusively that, considering the great amount of water given off from the leaves of plants during growth, there is good reason to conclude that sufficiency of matter for building up the plant is carried up by the sap, even allowing that amount to be little at a time. It was supposed that the "crude sap," as it was termed, was not in a state to be assimilated by the plant, until it had been exposed to the action of sunlight, by being spread out in the leaf, the carbonic acid gas there decomposed, the oxygen given off, and the carbon deposited as growth by the downward circulation. But where is the evidence that sunlight does decompose carbonic acid gas? My reading of chemistry is not very extensive, but I have observed but little to support such a conclusion, while electricity is well known to be able to release oxygen from its compounds with facility. The author in the *Encyclopedia* considers electricity as playing an important part in the growth of vegetable matter, and had he considered it as the principal agent in decomposing carbonic acid gas, he would, I think, have come nearer the true theory. Sunlight we know is important in growth; it gives the green color to vegetables, and may, in connection with electricity, aid in preparing matter for growth, but as the decomposition of carbonic gas is mainly performed while the sap is carrying it upward, it must be done without the aid of direct sunlight, principally, at least. Light and electricity are so similar in some of their effects, as to be difficult to discriminate between them. Electricity has been employed in increasing the product of vegetables, by raising poles in fields with wires extended above them, and then conducting these wires beneath growing vegetables, and thus causing a large increase of growth and productiveness. This increase was doubtless caused by the increased facility of the decomposition of the gas, as the electricity added nothing to the soil.

It is a well known law of electricity that when a body positively charged with it, comes in contact with another body in an opposite state, it always passes to it, so as to produce an equilibrium between the two, and should this latter body then become positive to the other, the fluid will pass to the former whenever a contact takes place. The air and the earth are often positive and negative to each other. Changes in the amount of electricity in the atmosphere are continually taking place. A driving, heavy fog has been known to exhibit electricity almost as strongly as a heavy thunder-storm. Indeed, most of the atmospheric changes may be fairly ascribed to its influence.

Here, then, we have a law of nature, fitted for the purpose exactly in the position to have the effect, and suited to every variety of growth.—Every sprig, every point of a leaf, is a conductor of electricity from the air to the earth, and vice versa. Whenever one is positive to the other, the fluid passes through these conductors, and having a strong affinity for the water of the sap in plants, it here meets the carbonic acid gas in the sap exactly where the carbon is needed for growth. No necessity for sending the matter for growth to the leaf to be vitalized. This roundabout way of producing an effect, is not in accordance with the simplicity of nature's operations, she always works in the simplest manner possible.

I claim no credit for any discovery in this matter, as the Prince of Humberg on "Terra Culture," lately among us, does in his theory. I only present the views of others, but they accord so well with my own observations, and so completely remove the difficulties that existed in my own mind relating to the downward flow of sap, which I could see no fact to support, that I at once gave in to the theory. I do not wish one individual to accept of this theory because I consider it the true one; let us individually examine into the laws of nature for ourselves; truth never suffers by examination, and it is hardly to be supposed that we are yet fully posted up in our knowledge of Nature's laws.

I may again express my satisfaction with the article of H. H. BARRETT, except the paragraph commented on, and have reason to believe, that if he will lay aside all previous theory on the subject, and bring facts, and the latest experiments of philosophy, to bear on the case, he will come into the view here presented. Wishing only to advance truth is my excuse for this essay.

Loudon County, Va., 1859. YARDLEY TAYLOR.

THE CURCULIO.—I give your readers a "*Sovereign Remedy*" for the Curculio, which if any doubt it, just try and report. Plums can be raised, that's certain. It is one of the easy things to do, viz.:—Just calculate to have a brood of chickens come along with about two or three week's growth, so as to have the old hen in a small coop, or tied, according to the circumstances of the case, near or under the plum tree as soon as the fruit begins to form, till the hardening of the stone, and the plum is beyond harm. The little "*Turk*" will not have many marks, especially if the chickens are called, and the tree is every morning or two jarred, and a few crumbs of food sprinkled around under the tree with the falling of the insects on jarring the tree. Not only will this pest become very scarce, but also all troublesome insects and worms throughout the garden, helping the gardener much more than all the damage unless on beds. Try it.—J. P. M., Sandusky, Ohio, May, 1859.

OYSTER SHELL LIME FOR GRAPES, &c.—Will you, or some of your subscribers, please inform me whether oyster shell lime is good for grape vines or fruit trees, or, as some suggest, whether it is injurious? I want the information from some one who has used the same. The lime has been used in manufacturing gas.—O. F. ADAMS, Macon, Georgia, 1859.

LIME, whether made from oyster shells or stone, is good on any soil where this mineral is deficient. Lime from gas-works is injurious to vegetation if applied fresh, but after laying exposed to the atmosphere from six months to a year it loses its injurious properties. This is our experience, and we believe it is sustained by the best European authorities, though our work in the garden is now too pressing to admit of our hunting them up.

We are so busy in the garden, fighting caterpillars, cozzing melons, &c., that some correspondence awaits attention. Next week we will make all right.

COLORING RECIPES.

EDS. *RURAL*.—As I take considerable interest in the column of recipes, I thought I would express that interest in a way that may perhaps add to the general satisfaction,—that is, by doing my share of the work pertaining thereto. I have some recipes that are excellent for coloring old white tonnet silks, lining and ribbons, so that the children's bonnets and hoods can be remodeled and made to look almost as "good as new."

PINK ON ROSE-COLOR.—Tie up a thimbleful of cochineal in a piece of strong cloth, then take two teacups, bowls, or larger dishes, according to the quantity of ribbons you wish to color,—put a little pulverized alum into one dish, a very little good cream of tartar and the bag of cochineal into the other, pour boiling water in each sufficient to give the articles plenty of room, put them (previously cleaned) into the alum water, rub out the cochineal with a spoon or fingers, until your dye is good color, then take the articles from the alum water, and put them in the dye. Let them remain until rose-color, or bright pink, as you prefer. The dye should be kept hot, and judgment should regulate the quantity of cream of tartar. If there be too much, it will not color well, if too little, the dye will be of a crimson or purple color. The bag should be preserved for future use, unless you color a very large quantity of silks, sufficient to extract its strength.

STRAW-COLOR.—Smartweed, boiled in brass, and set with alum, will color a fine straw-color.

ORANGE.—Bloodroot, boiled in brass, and set with alum, will color an orange color that is not easily faded. Old silk that is not very fair, will do just as well for this color.

DRAB.—If you wish for a handsome drab-color, boil sage in iron and set the dye with a little copperas. Be careful and stir the goods often, else they will spot.

These recipes are all for silk, and would not color cotton or wool, unless, perhaps, we except the straw-color. YANKEE ETCH.

COLORING RECIPE, CRACKER PIE, &c.

EDS. *RURAL*.—As others of your readers are contributing "good things" to the "*Domestic Economy*," here is our mite:

CRACKER PIE.—Six small crackers, broken into two cups of cold water, with two tablespoonfuls of sour boiled cider, little salt and a few lumps of butter. Flavor with what you please. Stir together—put into the crust and cover with another. This recipe is sufficient for a square tin, and is best when just cold.

JENNY LIND PUDDING.—Slice dry cake and steam it. Make a sauce of butter and sugar, and a little flour. Pour on hot water and season. Stir them together, and pour over your dish of cake.

TO COLOR SILK SALMON COLOR.—To a quart of rain water, put two teaspoonfuls of soda. Tie some annatto in a cloth, and rub into the water enough to get the required scald. When hot, put in your silk and let scald, then rinse in strong blueing water, (I used Bristol's Blueing Fluid,)—finally rinse in gum Arabic water and iron wet.

CAN any of your readers inform me where the best knitting machines are manufactured? The old-fashioned ones have been in use so long, we want an improvement,—one that can take more than one stitch at a time. NELLE. "Cottage Hill," N. Y., 1859.

HOW TO MEND BROKEN CHINA, &c.

MESSRS. EDS.:—In a late issue of the *RURAL* is an inquiry for a recipe for mending China. I give one taken from my "*Scrap Book*." Take a very thick solution of gum Arabic in water, and stir into it plaster of Paris until the mixture becomes a viscous paste. Apply it with a brush to the fractured edges, and stick them together. In three days the article cannot be broken in the same place. The whiteness of the cement renders it doubly valuable.

Allow me to say a few words about "*Scrap Books*." The cost is but a trifle, (seventy-five cents will pay for a good one), and the benefits are many. Mine has more than paid me a dozen times this spring. I have an old cigar-box with a cover, into which I put my "*scraps*" until an opportunity offers to paste them in. They are arranged under different "heads." The "*Farm*," "*Garden*," "*Household*," "*Stock*," &c. Many an invaluable "item" is thereby saved for future reference. J. A. P.

Oswego Falls, N. Y., May, 1859.

HOW TO DO UP SHIRT-BOSOMS.—Having seen a call for the best way to do up fine shirts, I take the liberty to say that the first step to the perfect ironing of a shirt bosom is to have it so made that it is possible to iron it smooth. As shirts are generally made, it is an impossibility to get more than a few inches smooth, (by smoothing, pulling both ways, and rubbing the wrinkles up and down,) in the front of the bosom so that when the vest is on, all looks right. I do not profess to be a teacher of shirt ironing, as it is a *knack* that can only be learned by practice. A mere child can be put in practice as soon as tall enough to reach the work, and will soon outdo the mother, if father or brothers will only praise them a little when they do their best. All cloth should be washed and boiled thoroughly (in order to shrink it) before making into shirts that are to have bosoms in them. Great care should be taken in sewing on the bosoms so that they will iron smooth—they should not be too long, as that is the chief cause of their shoving up by stooping. I think the best way is to have the bosoms in a *dickie*, and wear over a plain shirt.—A FARMER'S WIFE.

CREAM CAKE.—Two cups sugar; 2 do. cream; 8 do. flour; 3 eggs, 1 teaspoon saleratus. To be eaten warm.—EDWARDS, Skaneateles, N. Y., 1859.

"TIRED TO DEATH."

My lady is "tired to death!"
She has studied the print of the gay velvet rug,
And given her dear darling poodle a hug,
And from her bay-window has noticed the fall
Of a ripe nectarine from the low sunny wall;
She's embroidered an inch on some delicate lace,
And has viewed in the mirror her elegant face,
Has looked at an album, a rich bijouterie,
Then restlessly owned herself dead with ennui!

And my lady is "tired to death!"
Exhausted! It's strange that as day after day
Of her frivolous life passes slowly away,
So aimless and "stylish," so empty and fine,
So free from those duties sometimes called divine—
That she wears of something; she hardly knows what,
Thinks of not what she is, but of all she is not!
Oh, not all emotions are vulgar you know,
And my lady's have always been quite *comme il faut*.

Still, my lady is "tired to death!"
Oh, woman, false woman, false mother, false wife,
What account can you give of your poor wasted life,
Of that life that has passed like a feverish dream,
The life that has been not to be, but to seem?
What account will you give in the awful, last day,
When the pomp and the show of the world pass away,
When the Master demands of the talents He's given,
A stewardship rendered on Earth and in Heaven?

"Tired to death!"
Cast off for a moment your diamonds and lace,
And shine in the light of true womanly grace;
Look around you and see with eyes raised to the light,
Strong men and true women who live for the right;
Brave hearts that ne'er falter, though distant the goal;
Great lives whose fierce struggles will never be told,
Whose wild straying hearts stern duties control,
Whose only true life is the life of the soul!

Plain Talks to American Women.—No. 11.

BY MRS. M. P. A. CROZIER.

ONE of the most efficient means of moral culture—and one within the reach of every family—is music. Conducted aright, it has almost the power, for the time being, of transforming the earthly home into a heaven of purity and joy. How delightful the gathering together of the family around the bright fireside for an evening song! How sweet the united melody of the aged grandmother's tremulous voice, the father's deep bass, the brother's boyish tenor, and the soft treble of the mother and sisters. And if there be the sweet accompaniment of instrumental music, it is so much the more enchanting. How does the chain of harmony bind all hearts in one! And if it be devotional, how, in the consonance of sweet sounds, are the feelings of the heart elevated towards that holy world where angels strike golden harps, and sing anthems of praise eternally! How do the aspirations reach forth to a future participation in seraph songs!

And why is not this more common? Why, from the family altar, ascends not as frequently the voice of praise as the voice of prayer? The sentiments we sing, sing often and appreciatingly, are wont to sink deeply into our souls, and become, as it were, part of ourselves. There was much wisdom in the thought of him who said, "Let me make the ballads of a nation, and I care not who makes the laws."

How precious to us are the snatches of song—which we can never forget—sung to us by a loved mother in the days of our childhood! If that mother has passed away, do not the tear-drops start from their fountains, if, perchance, they are heard in the careless throng? How do their echoes linger in the heart, like the song of the dying swan, or like a breath of melody left fall from the lips of a passing angel on his ministering mission! Mothers, when you bend above your babes to hear them lip the evening prayer, sing softly to them some holy hymn, and, mayhap, even in their dreaming, you will see a smile light up their faces, to tell you they are happy. Be sure that happiness will steal into their souls like sunshine, and be reflected back again upon the giver. Some one has written as follows, concerning music:

"Appropriate singing has a wonderful effect in promoting a sweet disposition, and in calming angry feelings. Three brothers who lived in the same neighborhood were all hopelessly converted about the same time; and they frequently met together to sing and pray, and were remarkable for their piety, and sweet and amiable dispositions. Several months thus happily glided away; at length one of them was passing the house of another, he heard his two brothers engaged in an angry dispute—he went in and began to sing.

'How happy 'tis to see
Brethren all agree! &c.

They instantly ceased their dispute, and soon one joined in singing, and directly the other also.—Their angry feelings were banished, and they had a joyful season of prayer. Ever after they lived in peace and harmony. 'The mother by singing can charm her wayward children, and supplant the angry by the enchanting and subduing. When her children become frolic or ill-natured, she can sing them out of ill-temper into sweetness much more easily and effectually than by scolding and chastisement. One sweet tune, when they are wrangling, will quell wrath and promote love a hundred fold more than whips. The father is irresistible and the mother the toughest passions at once, the latter only resists.' This is undoubtedly often true. If even the savage breast is not insensible to its power, how much less that of the little child!

Let no one think that money wasted which is expended in procuring for the family circle some musical instrument, from which even the little ones may learn to draw forth harmony, and with the aid of which they may cultivate the ear and the voice to a greater perfection. Better that they be clothed in plain attire, and fed with plain food,

than that they be denied this inexhaustible source of enjoyment.

But not alone from the human voice, and from the works of art, should the child become conscious of the power of music! Teach him that

"There's music in the sighing of a reed,
There's music in the gushing of a rill,
There's music in all things, if man had ears."

Let his heart go out with the singing of the birds, and in its joyousness, become as wild and free as they! Let him listen to the murmur of the brooklet, the sighing of the wind among the pines, the "patter of the rain upon the roof," the "voices of the night," and the deep voice of "old ocean," and fill to its full measure his soul with the softness, the sadness, and the solemnity of the varied breathings, till he learns to love intensely the love-songs of Nature, and trustingly to listen to her melodious teachings, and appropriate them to his own spiritual sustenance.

Akin to the power of music is that of pictures. How much may a child be taught by them! What can you give to a child of two or three years, that will afford a better and more lasting entertainment than a book full of distinct and beautiful pictures? How interested will he become to point out various peculiarities, as the hump on the back of the camel, the trunk of the elephant, &c. Give him a pencil and paper, and let him try to make pictures. How delighted will he be with his robin birdie, his eagle birdie, his cage, and other pictures, none of which, perhaps, any one but himself would be able to name! Quite a general idea of natural objects might be given to a young child by means of pictures, and familiar oral illustrations, and gained in a manner not at all irksome or injurious to health. Far better this method of imparting instruction to the infant, than that of confining its attention to the printed page while as yet there is not sufficient physical stamina to endure safely severe mental application. Take a child of four years of age. Suppose you wished to give him an idea of a volcano. Explain to him that it is a great hill, as high as several of the highest he has seen, piled one top of the other; then tell him that fire, melted stones, ashes, &c., burst from its top and sides in such quantities as sometimes to bury whole cities; give him all the interesting facts upon the subject which you can call to mind, then show him a pictorial representation of such a scene, true to nature, and in after years, when he comes to take in hand a Geography, how readily will he memorize the definition given in reply to the question, "What is a Volcano?" So with a great variety of natural objects which he cannot have the opportunity of examining personally, as oceans, water-falls, animals, vegetables, different parts of the human system, &c.; exhibit to him correct plates, and interest him in their description. Let this course be pursued for two or three years before it is proper for him to attend school, or attempt reading, and what a fund of knowledge will be brought with him when his feet first seek the halls of science! With what a zest will he enter upon his new field of labors, feeling that the mysterious characters upon the printed page, will but open to him the gates to a long and delightful avenue of natural wonders!

But aside from their value as aids in intellectual culture, what deep moral lessons may be taught by appropriate pictures! Away with all such representations from the nursery as have no refining or instructive influence. Let its walls be hung with what is really beautiful and useful; let the picture-books put into the hands of the little ones convey no false or gross impressions, but tend to elevate, and how naturally will they drink in a love for the beautiful, the pure, and the true! Let representations begetting a martial spirit be avoided. Boys, especially, become so readily fascinated with the idea of military display, and military victory, that if the Christian mother would inculcate the peaceful spirit of Jesus Christ, she should be careful that her aim be not defeated by pictures of battle scenes, the praise of battle heroes, and the parade of military companies.

Do we not all remember some old pictures that hung upon the walls of the nursery of our childhood which we gazed at again and again, ever with interest, finding something upon which our fancy could play, our minds speculate, or which caused our souls to grow big with feeling. Perhaps some Scripture representation was so forcibly impressed upon the mind that we never read the passage illustrated, but we fancy it as having occurred as it was painted for our child-eyes to gaze upon. O, it is a pleasant thing in many ways to have a home adorned with pictures! We converse with them as with familiar friends, and the stories they tell to us oft become part of the treasure we cherish in the store-house of memory. Our hearts may be chastened and strengthened by their influence, till we become very different beings from what we should have been but for their presence. Blessings, then, on music and pictures! May every home be gladdened by the melody of the former, and the light that streams from the latter be as sunshine from the unclouded orb of day!

TRIALS OF MARRIED LIFE.—Married life has its trials and its sorrows. Tempers may prove incompatible, and call for forbearance. Fortune may be chary of its favors, and enforce self-denial. Children may be ungrateful, and sting the poor heart that has pilloved them. Sickness may come, and haunt a household for years. But ask the poor man, struggling along with his debts, and the weary woman, toiling early and late, accomplishing the ruin of all her beauty and her buoyancy, if they would be placed apart, could competence be given them, and all their trials be brought to an end. The answer would be:—"There is something sweeter in this companionship of suffering, than anything the world can offer from its store-house of joys outside of it, and something which would make even severer trials than ours only iron bands to draw us more firmly together."—*Springfield Republican*.

PROVIDENCE has so ordained it that only two women have a true interest in the happiness of man—his own mother and the mother of his children. Besides these two legitimate kinds of love, there is nothing between the two creatures except vain excitement, painful and idle delusion.—*Oceanic Review*.

A WISE.

BY JENNY MARSH PARKER.

LONG MON, hasten by with your wild boating rain—
I weary of watching in darkness and pain;
My bosom is cold and my heart is in twain—
I have prayed God for slumber and prayed but in vain.

The cup that I drained I have dashed to the ground,
And broken the weapon which dealt me this wound;
I have cast off the roses that died on my brow,
And the dust of their beauty drifts back to me now.

Stop, heart, stop thy throbbing—pale lips, hush your prayer—
Go, wild fiend of Passion, and couch in thy lair,
And pray on his footsteps, and spring force and sure,
And torture his foot to the death I endure.

Rochester, N. Y., 1859.

LETTERS FROM OUR FARM.—No. 6.

HAVE you seen the new Monthly for May? Not the *Atlantic* or *Pacific*, but Nature's grand issue, the *World's Pictorial*. It lies open before me as I write, a ponderous volume, bound in green and azure and clasped with golden sunbeams. Thousands and thousands of fingers have turned the delicate pages—thousands and thousands of eyes have wandered delightedly over the glowing pictures, but to-day not a leaf is torn or a color faded. For ages—none know how many—it has been issued fresh every month, moist and breathing of perfume, with such rare variety of contents that, from the little child to the white-haired sage, no sound heart ever wearied of it. Not like other volumes that drop from the press right into the hands of the rich in their palaces of brick and stone, and only wander occasionally away from towns and cities, growing old and stale by the way, Nature's great Monthly comes first to us here at Our Farm, and to all dwellers in broad, green, country places. In fact they never see it in town, or at best only short extracts, and pictures clipped out here and there, tantalizing hints of its peerless beauty.

Look at this picture—an orchard on a slope, the trees stooping to the weight of the great billows of bloom the spring has drifted over them. How the grey trunks show beneath, like rocks amid the sea of waxy grass that sways about their feet. Was ever a fairer foreground than that brook that creeps along through its fringe of alders, or a more exquisite background than the deep blue of the sky shading softly upward into paleness? See the oriole among the branches. What shall we call him—a golden blossom—a little winged bundle of music and sunshine. A single glimpse of the little flashing wanderer carries my heart straight back to childhood, to the days when I sat with folded hands under the cherry tree, with the white petals fluttering down upon me and only heard the brook below the garden wall, chime, chime, as it tinkled over the pebbles, and above my head the drowsy hum of the bees, and the short, mellow note of the oriole, flashing in and out with that low, rich trill that sounded like a quiet laugh of delight. Oh sunshine, and blossoms, and sweet May dreams!

There are songs scattered here and there through the pages—rare poems set to rarer melody—not written in our harsh tongue, but in the liquid syllables in which the birds and the winds talk to one another. Now and then a poet, silver-tongued and golden-hearted, catches the rhythm, and translates so truly that the busy people stop to hear, and go on saying the song over and over in their hearts, yet thousands of poems just as beautiful lie all about them, only waiting for lips loving enough to give their sweetness utterance.

DAME NATURE it would seem has her living to make as well as the rest of us, for here are her advertisements in flaming letters:

"New Goods! New Goods! Just received, and constantly arriving, the choicest assortment of Spring Goods ever offered to the public. Buds and Blossoms of every shade and hue, suited to all tastes and ages; Leaves of the newest and most desirable patterns—in short, everything that the most fastidious could desire. A large supply of the choicest and most valuable Perfumes always on hand, also a splendid assortment of Jewels, consisting of the celebrated dew-drop diamonds, pearls, &c., but customers must call early to secure these, as they will not be exhibited long after sunrise. The ladies will find some celebrated Tinctures and Cosmetics for beautifying the complexion, and imparting brilliancy to the eyes, such as the 'Balm of the Morning,' 'Glory of Sunshine,' and many others whose merits have been abundantly testified to. A band of trained minstrels always in attendance to furnish the best of music. 'Carpets of green tapestry laid to order upon lawns and enclosures, and hangings of embroidery furnished to suit all situations. Call at the old stand—out of doors.'"

Why should I try to review it—this richest, most exquisite of publications? Its great, unbroken, unutterable beauty rises up before me, and grows upon me as I write. With a feeling akin to reverence I turn the pages day by day, the pictures brightening towards the close, and think how in a few days the glorious June will interpret all these sweet May prophecies in grand fulfillment. *x*

HOMES.—Love watches over the cradle of the infant, over the couch of the aged, over the welfare and comfort of each and all; to be happy, man retires from the out-door world to his home. In the household circle the troubled heart finds consolation, the disturbed finds rest, the joyous finds itself in its true element. Pious souls, when they speak of death, say that they go home. Their longing for Heaven is to them a home-sickness. Jesus also represented the abode of eternal happiness under the picture of a home, a father's house.—Does this not tell us that the earthly home is appointed to be a picture of Heaven, and a foretaste of that higher home?

Written for Moore's Rural New-Yorker.

"FURROWS RUNNING THE WRONG WAY."

UNCLE JASPER and I were riding out one day, when we came to a field of pale yellow corn; some hills had two or three stalks, and some only one while a considerable number were without any. The owner was trying to dig up the tough sods that had taken a strong hold in the soil, and being near the fence—or, rather, an apology for one—uncle spoke to him—as is his custom whenever he meets with a neighbor. After the health compliments, he remarked, "Your corn does not come on very well, Mr. SATRES—what is the matter with it?"

"Why, you see, last year was a pretty dry season, and this field was too dry—it all baked down—then I cut the furrows down the hill so that the water all ran off; this year I run them across the slope, and as much wet weather as we have, there is water standing here nearly all the time—the furrows run the wrong way."

We passed on, silently for awhile, until I began to wonder if uncle would not make some of the quaint remarks which I love to hear so well, but still he remained silent. My thoughts had gone into another channel when he repeated—"The furrows run the wrong way!" There are no thoughts of mine that I like half so well as his, so I turned to him with a silent, but smiling inquiry, and he remarked:—"I fear a great many of Mr. SATRES' furrows run the wrong way—nor are his the only ones." After a few moments' thought, he continued:

"If you see a family trying to become respectable by imitating the style of the more wealthy, you may be sure the furrows are running the wrong way."

If you see a man whose daily practice does not agree with his religious profession, you need not fear that he will have more influence than his humble, but pious neighbor—the furrows run the wrong way."

If you hear a person tell of reading a great many books, you need not at once conclude that he is sensible—the probability is that the furrows run the wrong way."

If you hear a man speak contemptuously of those younger, or disrespectfully of those older than himself, you must not suppose him a kind-hearted man—the furrows run the wrong way."

If you see one try to injure the character of another in order to cover his own faults, be sure he will not succeed—the furrows run the wrong way."

If you see a youth very attentive to the young and sprightly of his lady acquaintances, and uncivil and neglectful of the aged, especially his mother, he will not become a great or good man you may be sure—his furrows run the wrong way. And if you see a young lady trying to win the attention of sensible men by gay dress, or a free manner, you may be sure her furrows are running the wrong way."

Damascus, Wayne Co., Penn., 1859.

CONSTANT EMPLOYMENT.

THE man who is obliged to be constantly employed to earn the necessities of life, knows not the unhappiness he prays for when he desires wealth and idleness. To be constantly busy is to be always happy. Persons who have suddenly acquired wealth, broken up their active pursuits, and begun to live at their ease, waste away and die in a very short time. Thousands would have been blessings to the world, added to the common stock of happiness, if they had been content to remain in a humble sphere, and earned every mouthful of food that nourished their bodies. But no; fashion and wealth took possession of them, and they were completely ruined. They ran away from peace and pleasure, and embraced a lingering death. Ye who are sighing for the pomp and splendor of life, beware! Ye know not what ye wish. How is it possible for you to be happy while you possess a deceitful heart? No situation, however; no wealth, however magnificent; no honors, however glorious, can yield you solid enjoyment, while discontent lurks in your bosom. The secret of happiness lies in this—to be always contented with your lot, and never sigh for the splendor of riches, or the magnificence of fashion and power. Persons who are always busy, and go cheerfully to their daily tasks, are the least disturbed by the fluctuations of business, and at night sleep with perfect composure. The idle and the rich are seldom contented. They are peevish, fretful, irascible. Bid them good morning, and they scowl. Nature and art have few attractions for them. They are entirely out of their view. While in this state, the springs of life are rusting out, and the decay of death has commenced undermining their constitutions.—*Goward's Journal*.

RESISTANCE TO IMPROVEMENT.—It was the physicians of the highest standing who most opposed Harvey. It was the most experienced navigators who opposed Columbus' views. It was those most conversant with the management of the Post-Office who were the last to approve of the plan of the uniform penny postage. For the greater any one's experience and skill in his own department, and the more he is entitled to the deference which is proverbially due to each man in his own province, the more likely, indeed, he will have to be a good judge of improvements in details, or even to introduce them himself; but the more unlikely to give a fair hearing to any proposed radical change. An experienced stage coachman is likely to be a good judge of all that relates to turnpike roads and coach-horses; but you should not consult him about railroads and steam-carriages. Again, every one knows, how slowly, and with what difficulty, farmers are prevailed on to adopt any new system of husbandry, even when the faults of an old established usage and the advantage of a change can be made evident to the senses.—*Whately*.

SO THEY SAY.—"They" will say anything and everything. "They" have said everything mean and despicable. "They" say things that break up families, crush hearts, blight hopes, and smother worthy aspirations. Whenever a man circulates a slander and gives "they" as his authority, turn your back upon him. He means no good.

Written for Moore's Rural New-Yorker.

"GONE BEFORE."

BY IDA FAIRFIELD.

GONE in the pride of his beauty,
In the opening bloom of his youth,
When his arm was strong for duty,
And his soul was pure with truth;
Oh, God! how heavily falls the hand,
Smiling again our desolate band!

Gone from the hearts that loved him,
From the home of his earliest years,
From the mother who kept o'er his cradle
Her vigil of prayers and tears,
Who needed the strength of his arm to bear
Her safely through life's journey of care.

Gone from the thorns besetting
The devious paths of youth,
From the hidden snares and pit-falls
Which lure the soul from truth,
And gone from a weary world of pain—
Can we wish the freed soul back again?

Gone where the loved are waiting—
Gone where the angels dwell—
Which lure the soul from truth,
And gone from a weary world of pain—
Can we wish the freed soul back again?

Gone where the loved are waiting—
Gone where the angels dwell—
Which lure the soul from truth,
And gone from a weary world of pain—
Can we wish the freed soul back again?

Independence, N. Y., 1859.

THE FIRST MORNING HOUR.

NATURE tells what it should be. Not ushered in with din and strife, and the trumpet call to battle; but stealing softly, quietly, serenely over the senses, with song of birds and scent of myriad flowers. Just so should the spirit be in its waking hours, buoyant, hopeful, bright, soaring, rejoicing. No cloud of discontent, no fog of sullenness, no biting breath of words that slay quicker than knife or bullet, and too often, God knows, those who, defenceless and hopeless, can wage with the tyrant victor no warfare. What misery a day, the first morning of which, thus ushered in, shall bring, ere its sunset—how many aching hearts can tell! How leaden the feet of duty move unvinced by love, how many a sorrowful household might reveal, did its tomb-like walls tell all the sighs and tears witnessed within them! Oh, mothers, fathers, guard your first waking thoughts! Burden not unnecessarily, or despondingly, or selfishly, the new born day with yesterday's discontents and sorrows, do not for your own sake; do not for the sake of those whose unlifted faces reflect every fitting shadow that mars the sunshine of yours. A frowning face! How sad a legacy for children to hang up in memory's cabinet, when they sit musing, in after years, on the influences that have marred their happiness and by so much maimed their usefulness. Look to the first morning hours of each day, for, like the little stone which you idly throw into the lake, careless where it sinks, it leaves a ripple that shall widen and widen till it reaches the shore of eternity.

HEAVEN'S TRUSTEE.—Beauty, we say, is given by God; it is a talent; position is given by God; it is a talent; but money, we are apt to say, is proper wages for our day's work; it is not a talent, it is a due. We may justly spend it on ourselves, if we have worked for it. And there would be some shadow of excuse for this, were it not that the very power of making the money is itself only one of the applications of that intellect or strength which we confess to be talents. Why is one man richer than another? Because he is more industrious, more persevering, and more sagacious than others. Well, who made him more persevering or more sagacious than others? That power of endurance, that quickness of apprehension, that calmness of judgment, which enables him to seize the opportunities that others lose, and persist in the lines of talents—are they not, in the present state of the world, among the most distinguished and influential of mental gifts?—*John Ruskin*.

SECRET RELIGION.—God is often lost in prayers and ordinances. "Enter into thy chamber," said he, "and shut thy door about thee." "Shut thy door about thee," means much; it means shut out not only frivolity, but business; not only the company abroad, but the company at home; it means, —let thy poor soul have a little rest and refreshment, and God have an opportunity to speak to thee in a still small voice, or he will speak in thunder. I am persuaded the Lord would often speak more softly if we would shut the door.—*Cecil*.

POWER OF KINDNESS.—Kindness is known to be a specific for many forms of disease, and kind nursing for many more. Christ's whole ministry was one of personal kindness. Charity is the great lever of Christianity; by it the messengers of the gospel can open the eyes of Pagan blindness; by it the ears of the most obstinate and hardened can be unstopped; by it reason can be restored and life saved; by it every human ill can be alleviated; by it all obstacles to the progress of Christianity can be removed or diminished.

A VERY COMMON MISTAKE.—Many Christians imagine that now since they have believed, they must draw their comfort from some other source, or in a different way from what they did at first; they turn their whole attention to themselves, their experience, and their graces. Forgetting that the true way of nourishing these is by keeping their eye upon the cross, they turn it inward, and try to nourish them by some process of their own devising.—*Selected*.

THE PEOPLE'S COLLEGE.

The Quarterly Meeting of the Trustees of this Institution was held in the village of Havana, on the 11th instant. The principal business transacted consisted in the adoption of the following resolutions:

Resolved, That, until otherwise ordered, the Trustees of this College will endeavor to endow or otherwise provide for the maintenance of the following named Professorships in this Institution, viz:

- 1st, A Professorship of Natural and Revealed Theology.
- 2d, Of Intellectual and Moral Philosophy.
- 3d, Of Jurisprudence and Political Economy.
- 4th, Of Logic, and the Science and Art of Instruction.
- 5th, Of Ancient and Modern History.
- 6th, Of English Literature, Rhetoric and Oratory.
- 7th, Of Taste, as applied to the Arts, and of the History of the Arts.
- 8th, Of Anatomy, Physiology, Hygiene and Veterinary.
- 9th, Of Natural History, comprising Zoology, Ichthyology and Entomology.
- 10th, Of Chemistry, Botany and Mineralogy.
- 11th, Of Agricultural Chemistry, and Chemistry as applied to the Arts and Geology.
- 12th, Of Practical Agriculture.
- 13th, Of Horticulture.
- 14th, Of Mathematics and Natural Philosophy.
- 15th, Of the Application of the Sciences to the Arts, comprising Architecture, Engineering, &c.
- 16th, Of Geography, Meteorology and Astronomy.

17th, Of the Latin and Greek Languages.

18th, Of the Modern Languages.

19th, Principal of the Preparatory Department.

Resolved, That there shall be established three Courses of Study in this College, which shall be severally denominated Classical, Scientific, and Provisional or Select; and for admission to the Classical Department, students shall be required to sustain an examination in such studies as are now required to be pursued in order to admission to the other Colleges of the State.—Students desiring to pursue the Scientific Course of Study, shall be required to sustain an examination in English Grammar, Geography, Arithmetic and Algebra, through simple Equations. For admission to the Provisional or Select Course of Study, no more shall be required, than that the student shall have capacity and culture sufficient to enable him to pursue with profit to himself and without hindrance to others, the branch or branches of study of his choice.

The length of the College Course to be pursued in the Classical and Scientific Departments, to entitle students in the one case to the degree of Bachelor of Arts, and in the other to that of Bachelor of Science, shall be four years. Students, however, who may enter the College with the intention of pursuing a Select Course of Study, shall, at the close of their course, be entitled to an examination in the branches pursued by them, and, if meritorious, to a certificate, or diploma, carefully written and signed by the President of the College and such other persons as may be hereafter designated, which shall expressly specify the branches pursued by them.

Rev. F. G. HIBBARD, editor of the Northern Christian Advocate, was appointed to the Professorship of Natural and Revealed Theology, in the College.

The President was directed to procure some gentleman of distinction to pronounce an address in the Chapel of the College, at the next meeting of the Board, in August.

HOW TO TEACH THE ALPHABET

At a recent school meeting in Boston, GEORGE B. EMMERSON, Esq., had something to say of what he had seen of teaching in Europe during his travels. He spoke of what he saw in Dresden. He spoke of teaching the alphabet—of its usually being regarded as a drudgery, which he called a sad mistake. He cited an example of forty boys, seven years old, coming to learn their alphabet. It was taught by a man competent for a College President. He commenced by drawing a fish on the blackboard, and inquiring of the boys, "What is that?"

One answer was, "A fish," another, "It is the picture of a fish," and another, "It is the drawing of a fish." "Right," said the teacher to the last. They were then required to make a nice sentence about the fish. This being done, he then placed before them the letters that made the word. They were then required to put the letters together so as to spell the word. This was done; also the making of the letters on their slate, forming the word. They were next required to draw the picture of the fish. This was the method of teaching the alphabet, by no novice, but by a most learned German scholar. This method of thoroughness was everywhere practiced in teaching—a little at a time, and constant repetition. "The effect of this method," said he, "was surprising." How unlike is this method to that pursued in our primary schools! The teachers use no books in teaching. Consequently their minds are wholly on the matter of teaching—watching the effect of their teaching upon their children. When their interest tired, their attention was directed to a new subject, and thus the happiest results are produced.

A GEM.—The following beautiful gem, taken from a speech of Webster, has been printed in large and bold types, on thick card paper, and distributed among the schools of all grades in New London, by a gentleman of enlarged and enlightened views on the subject of education. In their neat gilded frames, they not only adorn the walls of the school-room, but shed forth a light upon the teacher's pathway, encouraging him to press on in the imperishable work in which he is engaged.—"If we work on marble, it will perish; if we work on brass, time will efface it; if we rear temples, they will crumble into dust. But if we work upon immortal minds, if we imbue them with high principles, with just fear of God and their fellow-men, we engrave on those tablets something which no time can efface, but which will brighten to all eternity."

MISTAKE IN EDUCATION.—One great mistake in our present school system consists in the number and variety of studies required of the children. A few things thoroughly learned and fixed for life, are much more useful than a mass of facts hastily committed to memory, never properly digested, and soon so far forgotten as to leave only indistinct impressions.

The Reviewer.

HINTS TO HORSE-KEEPERS.—A Complete Manual for Horsemen: Embracing How to Breed a Horse, How to Buy a Horse, How to Break a Horse, How to Use a Horse, How to Feed a Horse, How to Physic a Horse, (Allopathy and Homoeopathy), How to Groom a Horse, How to Drive a Horse, How to Ride a Horse; and chapters on Mules and Ponies. By the late HENRY W. HERBERT, (Frank Forester). With Additions, including "Barry's Method of Horse-Taming," and "Baucher's System of Horsemanship," also, giving Directions for the Selection and Care of Carriages and Harness of every description, and a Memoir of the Author. Beautifully Illustrated. (13 mo.—pp. 438.) New York: A. O. Moore & Co.

The inviting appearance of this volume, in addition to the important subjects discussed in its pages, induced us to give it an examination on its first receipt, to the neglect of other works awaiting notice. And we were so well repaid for our time that we resolved to embrace the earliest opportunity to commend the work to the large number of our readers who are horse-keepers if not horsemen.

The Horse—a good, sound, well-trained, gentle yet free and "ready" specimen of the equine race—is an "institution" in this country which must continue popular and in demand, for pleasure driving and business, though the land may be intersected with railroads, and hence such a work as the one before us will prove of great value to those who wish to understand his characteristics, training, and the treatment of his diseases. The first thirteen chapters were written by Mr. HANNAH only a short time before his death, and the outlines of the remaining ones were being filled out by him when his earthly career was terminated. His portion of the work is worthy the reputation of the author of "The Horse of America," comprising much valuable information on the various topics discussed, even to those who consider themselves well posted thereupon; while the volume seems to have been completed by persons qualified for the work. Combining, as we are assured it does, the experience of a number of competent contributors, the work necessarily embraces a completeness and variety not to be expected in the production of any one mind. The book certainly contains a great amount and variety of information, the hints including almost every subject of interest to owners of horses, in a brief and condensed style—adapted to the wants of those who do not wish to examine several volumes to ascertain certain facts, or obtain a little information. Indeed, we look upon the work as a sort of Cyclopaedia of Horsemanship, as it comprises, in one, a compend and the main facts of several elaborate volumes on different branches of the subjects it comprehends, with the addition of late discoveries and improvements. Unless we misjudge these "Hints to Horse-Keepers" will prove a most valuable acquisition. In external, typography and illustrations, the volume is worthy of its contents, and very creditable to the publishers.

THE SPY: A Tale of the Neutral Ground. By J. FENNIMORE COOPER. Illustrated from Drawings by F. O. C. DARLEY. (12mo.—pp. 468.) New York: W. A. Townsend & Co.

The beautiful appearance of this volume constrains us to again commend Messrs. TOWNSEND & Co.'s splendid edition of COOPER'S WORKS. In the language of a contemporary, "the unrivalled illustrations of this edition by Mr. DARLEY give each successive volume a new interest, as it issues from the press. The artist has caught the very spirit of the author in his characteristic designs, which are reproduced with excellent effect by the skill of the engraver. In every respect, this beautiful library edition deserves to be in the hands of the admirers of FENNIMORE COOPER." Sold by DEWEY.

BROKEN CHAINS; OR, THE STORY OF JESSE WORTHINGTON. (16mo.—pp. 384.) Published by the American Sunday-School Union.

THE FIRST TWENTY YEARS OF MY LIFE. By ALLEN RICHMOND. [pp. 268.] Same publishers.

THE WORKING BOY'S SUNDAY IMPROVED. [pp. 210.] Same publishers.

These volumes are published in the best style of the Society under whose auspices they are issued. Each teaches an important lesson, and may be read with interest and profit by both parents and children.

The Union announces that, in addition to the large number of books already on its Catalogue (being over twelve hundred distinct volumes,) it will issue a new work every Saturday during the year. ADAMS & DANEY are its Agents in Rochester.

Books Received.

THE LIMITS OF RELIGIOUS THEOLOGY EXAMINED. In Eight Lectures delivered before the University of Oxford, in the year 1858, on the Bampton Foundation. By HENRY LONGUEVILLE MANSIELL, B. D., Reader in Moral and Metaphysical Philosophy at Magdalen College; Tutor and late Fellow of St. John's College. First American, from the third London edition. With the Notes Translated. (16mo.—pp. 384.) Boston: Gould & Lincoln. Sold by ADAMS & DANEY.

THREE YEARS' WANDERINGS OF A CONNECTICUT YANKEE, IN SOUTH AMERICA, AFRICA, AUSTRALIA AND CALIFORNIA, WITH DESCRIPTIONS OF THE PEOPLE, MANNERS, CUSTOMS AND CONDITIONS OF THE PEOPLE, INCLUDING MINERS, NATIVES, &c. Also, a detailed account of a Voyage Around the World, attended with unusual suffering, hardship, privation, disappointment, and dangers arising from fearful storms; threatened wrecks on rocky coasts, and amid reefs; by fire, deception, mutiny, &c. Also various incidents of life on Shipboard. By C. M. WELLS. Illustrated with beautiful Steel Plate Engravings. New York: American Subscription Publishing House. [pp. 558.] From L. STEEDMAN & Co., Hartford, Ct.

THE ART OF EXTENSIVE SPEAKING. Hints for the Pulpit, the Senate, and the Bar. By M. BAUTAIN, Vicar-General and Professor at the Sorbonne, &c. With Additions by a Member of the New York Bar. (16mo.—pp. 384.) New York: Charles Scribner. Sold by ALLINGS & COZBY.

MOBILITY. By the Author of "Salad for the Soldier." 8vo. (12mo.—pp. 420.) New York. Cass. Scribner. For sale by ALLINGS & COZBY.

THE ROMANCE OF A POOR YOUNG MAN. Translated from the French of OCTAVE FROELICH, by HENRY J. MACDONALD, late of Corpus Christi College, Oxford. (16mo.—pp. 318.) New York: Rudd & Carleton. Sold by DEWEY.

THE VAGABOND. By ADAM BADRAU. (16mo.—pp. 388.) New York: Rudd & Carleton. Sold by DEWEY.

HIGH LIFE IN NEW YORK. By JONATHAN SLICK, Esq., of Weatherfield, Conn. A Series of Letters to Mr. ZEPHANIAH SLICK, Justice of the Peace, and Deacon of the Church over to Weatherfield in the State of Connecticut. Embellished with Illustrative Engravings. Phila.: T. B. Peterson & Bros. [16mo.—399.] Sold by DEWEY.

THE JEALOUS HUSBAND. A Story of the Heart. By Mrs. ANNETTE MARIE MAILLARD, author of "The Compulsive Marriage," "Zuzza, the Olipha," &c. (16mo.—pp. 375.) Philadelphia: T. B. Peterson & Bros. Sold by DEWEY.

BEN SYLVESTER'S WORD. By the Author of "The Hair of Redclyffe." New York: Appleton & Co. [pp. 141.] Sold by DEWEY.

THE SINGER'S MANUAL: Consisting of 1st, A Complete Elementary Treatise on Music, with full Practical Illustrations and Exercises; 2d, Glee and Part Songs; 3d, Church Music; 4th, Music for Concerts and Singing Schools. Arranged for the use of Singing Schools, Choirs, the Social Circle, Concerts, and Exhibitions. By W. WILLIAMS, author of "Gloria in Excelsis," "The Song Wreath," "Oratorio of 'Our Saviour,'" &c. Boston: Shepard, Clark & Brown. For sale in Rochester by ALLINGS & COZBY.

THE SONG WREATH.—Outstanding the Elementary Principles of Music, carefully arranged in a new, simple and concise manner for instruction, together with a Collection of Music for the use of Schools, Juvenile Classes, Exhibitions, and the Social Circle. By W. WILLIAMS, author of "Gloria," "Sabbath School," "Oratorio of 'Our Saviour,'" &c. Boston: Shepard, Clark & Brown. Sold by ALLINGS & COZBY.

TRY, TRY AGAIN.

1. 'Tis a lee-son you should heed, Try, try a - gain;
2. Once or twice though you should fail, Try, try a - gain;
3. If you find your task is hard, Try, try a - gain;

If at first you don't suc-ceed, Try, try a - gain.
If at last you would pre-vail, Try, try a - gain.
Time will bring you your re-ward, Try, try a - gain.

Then your courage should appear, For if you will persevere,
If we strive, 'tis no disgrace, Though we may not win the race,
All that other folks can do, Why, with patience, may not you?

You will conquer, never fear, Try, try a - gain.
What should you do in that case? Try, try a - gain.
On - ly keep this rule in view, Try, try a - gain.

FRANCE AND AUSTRIA.

Just at the present time the following article, which we clip from the Cincinnati Enquirer, will prove of interest as exhibiting the feelings which have ruled "Camp and Court" in both Austria and France for the greater portion of the past century, and as proving that the relations of these two Powers have not always been such as would characterize the best intentions and the kindest feelings. The Enquirer says:

"Within the last seventy years there have been five wars between France and Austria on the continent of Europe. Austria was one of the first nations that took up arms against the French Revolution. In connection with Prussia, in 1792, her armies invaded France. After a desperate struggle they were driven out by the energy of the French Republican Assembly, and by the valor and military skill of Gen. Demourier. The French Assembly, by a conscription, called out one million two hundred thousand men for the defence of the country, a military exertion which has seldom, if ever, been equaled in military annals.

Prussia and Spain withdrew from the coalition, and, in 1696, Austria was left to sustain the shock of the French in Italy. She was supported by the King of Sardinia, a State which is now her bitter enemy. The French army under Napoleon in two campaigns detached Sardinia from the alliance, drove her troops out of Italy, and pursued them into Germany, nearly to the gates of Vienna. Under the walls of that capital France dictated peace to Austria in 1796. By that peace she made large cessions of territory and influence in Germany.—As a recompense, Napoleon assigned her Venice and Lombardy, and first made her an Italian power.

In 1799, Austria and Russia took up arms against France, and for a time were very successful. They drove the French out of Italy. In the latter part of that year, however, Napoleon returned from Egypt. He induced the Russian Emperor Paul to withdraw from the Austrian alliance. Having accomplished this he led his army into Italy. On the plains of Marengo he fought a decisive battle, the result of which expelled Austria from Italy.—It was soon followed up by the victory of Hohenlinden, in Germany, gained by the French under General Moreau. The French columns were again near Vienna, and again France compelled Austria to sue for peace. In 1804, the Emperor of France became the King of Italy. Immediately after Austria and Russia attacked France. Such, however, was the power of the latter, that in six months one Austrian army was destroyed at Ulm, and another, together with the Russians, destroyed at Austerlitz. The French entered Vienna and again dictated a peace.

In 1809, Austria and France again met in collision on the tented field. The French, however, under Napoleon, marched down the valley of the Danube with the velocity, almost, of the wind, and in one campaign took up their quarters in Vienna. A severe and ignominious peace for Austria was the result. In 1813, Austria United with all the great powers of Europe, overthrew the French Empire, and broke down the very power which had so often entered the gates of Vienna in triumph.—

By the treaties of 1814 and 1815 the northern States of Italy, Venice and Lombardy, were ceded to Austria by the leading nations of Europe. It is now on the faith of these treaties that Austria rests her case, and appeals to the rest of Germany, and to England, to assist her in maintaining them inviolate. As they were the treaties which witnessed the humiliation of his uncle, Louis Napoleon has no great respect for them."

RULES FOR TRAVELERS.—The following rules, all of which, we believe, are founded on legal decisions, are of sufficient importance to travelers to be committed to memory:

It has been largely decided that applicants for tickets on railroads can be ejected from the cars if they do not offer the exact amount of their fare. Conductors are not bound to make change.

All railroad tickets are good until used, and conditions "good for this day only," or otherwise limiting the time of genuineness, are of no account.

Passengers who lose their tickets can be ejected from the cars unless they purchase a second one.

Passengers are bound to observe decorum in the cars, and are obliged to comply with all reasonable demands to show tickets. Standing upon the platform, or otherwise violating a rule of the company, renders a person liable to be put from the train.

No person has any right to monopolize more seats than he has paid for, and any article left in the seat while the owner is temporarily absent, entitles him to the place on his return.

"ALESSANDRIA."—This place, the rendezvous of the Sardinian army, whither the King has gone to take command, is probably destined to play an important part in the coming war. It is a fortified city, near the eastern frontier of Piedmont, whose guns bristle towards the Austrian territory. It stands in the midst of a sterile plain. It is the great stronghold of Piedmont, and is to the Sardinians what Gibraltar is to the English, or Sebastopol was to the Russians. During the reign of the French in Italy, its formidable fortifications made it one of the strongest places in Europe, but these were subsequently demolished, leaving only the citadel. Within the past few years workmen have been busy in reconstructing them, in anticipation of the events now at hand. In the surrounding plain, two miles distant, is Napoleon's celebrated battlefield of Marengo. Alessandria is garrisoned with several thousand troops, and, being connected with Turin and Genoa by railway, any number can be readily concentrated there. To capture it would be a crowning glory to the Austrian Generals, and to lose it a deep humiliation to Sardinia.

"THE TICINO."—Cesar's decisive step was the "Crossing of the Rubicon," and the step conceded on all hands to be decisive of peace or war, is the Austrian Army's crossing the Ticino. This stream is a small river rising at the foot of Mount St. Gothard, in Switzerland, flowing southwardly through Lake Maggiore, and finally emptying into the Po near Pavia. During the latter part of its course it forms the boundary line between Lombardy and Piedmont, and hence its importance in a military point of view. It is easily crossed and not strongly defended, is remote from the centre of Sardinian population and strength, and hence is naturally chosen as the most feasible entrance for the Austrian troops into Sardinian territory.

It is a universal rule, which, as far as I know, has no exception, that great men always resemble their mothers, who impress their mental and physical mark upon their sons.—Michelet.

YOUNG RURALIST.

DECEPTIVE APPEARANCES.

THAT the world in which we live is fraught with deceptive appearances is an unmistakable fact, and that mankind are very apt to judge by outward appearances, is very true. That we allow ourselves to be governed by the eye, to form our likes and dislikes, to banish or embrace as it may seem to please in appearances, is also true. The black, the rough, the uncouth, we are ready to discard, while the dazzling, the high polished, the white, the beautiful to gaze upon, we are ready to grasp. Within the black and sooty bed of coal we procure our choicest diamonds. Within the repulsive shell of the oyster are found valuable pearls; not always, as many can testify not a thousand miles from us, who, toiling night and day to dissect the poor creatures, obtaining only those which proved a slight resemblance, and valueless. Nay! it is not all gold, that! Neither are all diamonds that sparkle. Many worthless pieces of glass are palmed off upon the unwary as diamonds, or precious stones. How prone are we when we see the gaily attired, the man of wealth, surrounded by all that is magnificent and beautiful; the man of fame, of honor of a high-sounding name, to believe they possess clean hands and pure hearts, free from guile and wrong. But alas! how often are we deceived. Often do we form attachments to friends, believing they are what they appear to be. Our very thought is confided to them. But oh, how often do they prove false. Let misfortune come and you find yourself deserted.

The friends that in our sunshine live,
When summer's gone and down;
And those that have but tears to give,
Must weep those tears alone.

When Satan wishes to accomplish any amount of evil he attires himself in the livery of Heaven that he may the better accomplish his nefarious designs. The villain who contemplates evil will meet you with a bland and smiling countenance.—It is not the people of our day who alone are deceived by false appearances. Our Mother Eve was surrounded by everything that was luxurious and beautiful,—all that was necessary to health and happiness was hers,—yet there was one little tree laden with forbidden fruit which attracted her eye that was so beautiful; surely thought she, death cannot be therein—I will eat. Eat she did, and we are reaping the bitter consequences; and we have received from her this frailty of being deceived by appearances. PAGE 2. BOLLOCK. Ellsborough, Jeff. Co., N. Y., May, 1859.

YIELDING TO TEMPTATION.

THE progress of the youth, from the time he begins to mingle in society, is full of trials and temptations. The youthful mind is naturally inclined to seek for pleasure and recreation, and this should be sought at home, and if sought, as a general rule, it will be found there.

Youth are easily led from the paths of virtue, and on this point they should be on their guard. The young man, just commencing business, has many trials to undergo, and temptations to overcome. If he yields to discouragement and neglects his business, serious consequences are apt to follow. The young man, endowed with fine talents, promising to become a respectable and honorable citizen, is frequently tempted, and sometimes yields to some of the temptations which are thrown around him. Ruin and disgrace is the consequence; he neglects his business, and is unconcerned and sluggish in the duties of life. He is frequently seen lounging around groceries and saloons, satisfying his growing appetite for strong drink.

Time passes, and ere he is aware, it has made its wrinkles on his brow; his cheeks are furrowed, and his eyes are sunken. Intemperance, brought on by the non-performance of his domestic duties, has made its impression. His home becomes a scene of misery,—happiness is not there. Wretched relatives are left to suffer the disgrace of his misspent time. What was once a happy home becomes a scene of wretchedness and misery. But this cannot always last. Death seals his fate. The companions of his youth who resisted the trials and temptations which beset their path, are bright and intellectual men, and an honor to the world; but he is gone; gone to fill a drunkard's grave.

Gulford, Medina Co., Ohio, May, 1859. J. C. C.

THE CROW.—In the article on Winter Birds we have this defence in the Atlantic Monthly:—He consumes, in the course of the year, vast quantities of grubs, worms, and noxious vermin; he is a valuable scavenger, and clears the land of offensive masses of decaying animal substances; he hunts the grass-fields, and pulls out and devours the underground caterpillars, wherever he perceives the signs of their operations, as evinced by the wilted stalks; he destroys mice, young rats, lizards, and the smaller serpents; lastly, he is a volunteer sentinel about the farm, and drives the hawk from its inclosures, thus preventing greater mischief than that of which he himself is guilty. It is chiefly during seed-time and harvest that the depredations of the crow are committed; during the remainder of the year we witness only his services; and so highly are these services appreciated by those who have written of birds, that I cannot name an ornithologist who does not plead in his behalf.

TEMPERANCE.—It is like an Alpine avalanche that lays waste all that is before it. Youth of America!—if you hope for peace or happiness,—if you ever expect to enjoy the blessings of life, to be respected by the good and virtuous, you must abstain from the use of ardent spirits. Not only is it demoralizing and destructive to health, but it is also ruinous to every bright prospect, to everything that makes life happy.—A School Boy, Pullneyville, N. Y., May, 1859.

The way of the world is to make laws, but follow customs.—M. de La Fayette.

Affairs at Washington.

Just previous to Count Sartiges leaving Washington, recently, he openly said in a conversation with two well-known gentlemen of the State of New York, that if there should be a European war he believed it would not be without embarrassment to our commercial relations, for the right of search would be re-asserted and enforced. This remark was made with emphasis. The responsibility of the parties from whom this information was derived leaves no doubt of its truth.

All the new Naval steamers are to be put in commission as soon as they shall be successfully finished, and before the close of this year every available vessel will probably be in active service. The design is not, however, in reference to the European war, as no damage to our commerce is apprehended from that cause. Vera Cruz is considered, in official quarters, to be one of the most important points where a large fleet is required, and hence additional vessels will be despatched to the Gulf of Mexico. The facilities in the neighborhood of Central America, afforded by our squadrons, either for sea or land operations, are considered sufficient for all emergencies.

Efforts are being made to supersede Mr. Dallas as Minister to Great Britain, by Attorney-General Black, and to replace the latter by Commissioner Reed, just home from China.

Mr. Reed, ex-Minister to China, closed the affairs of his legation to the entire satisfaction of all. The provisions of his principal treaty in June last are yet imperfectly understood. Mr. Ward, his successor, took it to exchange ratifications. All the great powers agreed upon having temporary missions only at Peking, abandoning the idea of making that a permanent residence.

The basis of the treaty arranged by Minister McLane is on the principle of that which existed before the treaty of Guadalupe Hidalgo, and which regulated the commercial intercourse from the borders of the Missouri to and from Santa Fe. In this case the right of way over Mexican territory to the Gulf of California, is proposed, with every prospect of success. Ex-Commissioners Reed and Bowlin have met with a cordial reception from the President, and others associated with him in the government.

The first installment of \$100,000 of the debt ascertained and adjusted in the treaty recently concluded by Minister Reed with the Chinese Government, and due by it to certain American citizens, has already been received at the U. S. Treasury.

The Administration has recently received such evidences of the good faith of Great Britain as to satisfy it in the belief that she is sincerely disposed to fulfill all her engagements with this country in regard to the Central American question.

Personal and Political.

The Republican State Convention of Maine is to be held in Portland on Monday, the 6th of July.

The Legislature of Connecticut is in session at the present time. Among other movements, a License Law has been introduced, as a substitute for the present Prohibitory Law, and referred to the proper committee.

The Democrats of Texas have nominated for Governor, H. R. Runnels; for Lieut. Governor, F. R. Lubbock; for Commissioner of the General Land Office, F. M. White, of Galveston—all three the present incumbents. A resolution in favor of the re-opening of the slave trade was tabled, after a stormy debate. Col. W. N. Waul has been unanimously nominated for Congress by the Democrats of the Galveston District.

In several of the Democratic Conventions in Alabama, for the nomination of candidates for Congress, notice is given that they will, at the Charleston Convention, insist upon a platform in which the doctrine of Congressional intervention in favor of Slavery in the Territories will be insisted upon.

The Washington States advises Mr. Buchanan to convene Congress on the third Monday in September—the substantial reason for an extra session being furnished by our peculiar relations with Mexico. The States adds that, as far as "concerns detriment to good neighborhood, peace and commerce, 'the gem of the Antilles' is a mere stalking horse to us at present, while Mexico is a loud, outspoken, palpable reality."

The mixed up condition of party politics is shown in the fact that the democrats of the ninth Congressional District in Kentucky have re-affirmed the doctrine of squatter sovereignty in respect to slavery in the Territories and denied the authority of Congress to legislate in respect to it, while the opposition in the same district take the ground that Congress can and should legislate to protect slavery in the territories.

SAN FRANCISCO dates of the 25th ult., have been received. Senators Broderick and Gwin were mustering their respective forces for the ensuing campaign. There will be two democratic tickets in the field, Leocompton and Anti-Leocompton. The State Convention is to be held at Sacramento, June 15th.

Weather of the First Half of May.

The fine weather of another half month has been quite acceptable, though preceded by so much of the like kind for several months. The warmth of many of the last fifteen days has been called extraordinary. Certainly it has been striking, as well as heating. Let us see. The average heat of this half for twenty-two years is 52.9°, and for this present is 59.7°, showing above the mean about seven degrees. Last year this mean was about the average. In May, 1842, the mean was ten degrees below that of this half month, so that we cannot longer compare the season of that year with the present. Indeed, I find no first half of May with so high a mean temperature as the present.

At the beginning of May the season was not much in advance of some other years. But from the 4th to the 9th was very warm, and vegetation came forward with great rapidity. Cherries, pears and apples showed a great profusion of blossoms, and the trees of the latter were truly loaded with them. Last year at the 7th, vegetation was rapid, but was exceeded by that of this year.

In the five years from 1843 to 1848, inclusive, the average of this half of May was above the mean of it for twenty-two years, but three to five degrees less than this year. Turning to an old record of the heat of this part in 1830, the mean was a little higher than this year; but of that season I find no other record.

The heat was 86° at noon of the 9th, and not much less the day previous. But the heat has been lessened in the afternoon of several days, by a breeze from the N. N. E., and the cooler—Lake Ontario. Rochester, May 17th, '80. O. D.

DANGEROUS COUNTERFEITS.—According to the Buffalo Courier there are in circulation at the present time a large amount of the genuine notes of broken Nebraska and other Western Banks, which have been altered by erasing the original name and inserting the title and name of the town and location of very many good New England Banks. The altering process has been so skillfully accomplished that these spurious notes will deceive every one not acquainted with the genuine bills of the banks whose issue they purport to be.

THE LIQUOR "NUISANCE" IN MASSACHUSETTS.—Some months since Judge Shaw decided that intoxicating liquors might be destroyed in that State as a "nuisance." A writ upon this decision was carried up to a full bench, and the unanimous opinion of the Court, as now given, is that the legal sale of spirituous liquors is not a nuisance of such a character as to justify its destruction at the hands of the citizens. A new trial of the case is therefore ordered.

THE CUBAN FILLIPISTERS.—Correspondence from Havana, 8th inst., states, that the orders of General Concha, to the commander of the Spanish war steamer sent to Hayti to look after the welfare of the Cuban "Convention," were to offer them a passage to New York, and to supply them with such necessities as, in their military misadventure, may have been lost, &c.—that is, to see that they did not suffer for the want of funds.

AMERICAN BAPTIST MISSIONARY UNION.—The American Baptist Missionary Union held its 45th anniversary in New York on the 19th inst. Ex-Gov. Briggs, of Massachusetts, presided. The attendance was large. The new Constitution proposed by the Board of Managers was discussed and finally adopted. It was opposed mainly by those who desired to do away with life memberships and abolish entirely the Board of Managers.

BATTLE WITH THE INDIANS.—Austin (Texas) advises of the 11th inst. state that Capt. Bayer entered the Upper Reserve on the 3d, with 50 men, killed 15 Indians and fled. A party of dragoons and Indians were pursuing him. There was great excitement, and the Indians in the Lower Reserve had left their farms for Capt. Bayer's encampment.

The Pike's Peak Humbug.

The Detroit Advertiser says that Mr. Stephen C. Johnson, of that city, an old California gold digger, left Detroit on the 5th of March last, and has just returned. He fully confirms the reports that the whole thing is a most stupendous humbug, conceived in fraud by a set of unmitigated sharpers and swindlers, the chief of whom is the notorious Gen. Larimer. After having prospected the alleged gold region thoroughly, he satisfied himself that the reports in regard to the inexhaustible supply of gold at Pike's Peak have been manufactured by unprincipled spectators, for no other purpose than to give them an opportunity to prey upon those who might be drawn to the fabulous El Dorado in search of the precious metal. Mr. Johnson's report is highly unfavorable in every respect, and wherever his statements are credited, and his reliability is vouched for by the Advertiser, they will have the effect to stop further emigration to the Pike's Peak "gold diggings."

Mr. J. B. Bromley, Route Agent of the Overland Mail Company, writes from Cottonwood Springs, April 28th, to his employers:—"Pike's Peak has turned out to be a humbug, and the road is lined with starving men; and God knows we have got to give them something to eat as long as we have it. If you could do something to keep the poor deluded beings from starving, you would be doing a kindness to humanity. We will try and get through as well as possible, but lots of the poor fellows are bound to die. There are no provisions in the country only what belongs to the Mail Company. The traders along the road have nothing in the way of provisions. They (the emigrants) have not attempted to force anything yet, but are bound to do it if you do not give them something to eat."

A letter, dated Fort Kearney, 8th inst., says that the Pike's Peak emigrants are returning in droves. Nine hundred wagons had passed the Fort in a week. The emigrants were in an extremely destitute condition and selling their wagons, horses and out-fits almost for nothing.

Leavenworth dates to the 17th, state that there is a great scarcity of provisions in the mines at Pike's Peak, and much suffering among the emigrants. Several deaths were reported from starvation, and the emigrants are arriving in a destitute condition. An abundance of provisions, however, are on the way, from several points. Contradictory reports prevailed regarding the mining prospects, and the general tenor of the intelligence, however, is not encouraging; but the unfavorable accounts are ascribed to the destitute and discontented emigrants. No remittances of dust or rich discoveries are announced.

The St. Joseph correspondent of the St. Louis Democrat notices the arrival at that place of 100 Pike's Peakers who give deplorable accounts of mining prospects and suffering on the Plains. It is estimated that 10,000 men are now on their way, all or most of whom, destitute of money and the necessities of life, are perfectly reckless. Desperate threats are made of burning Omaha, St. Joseph, Leavenworth and other towns, in consequence of the deception used to induce emigration. Two thousand men are reported fifty miles west of Omaha in a starving condition. Some of the residents of Plattsmouth have closed up their business and fled, fearing violence at the hands of the enraged emigrants.

POSTAL REVENUE.—The returns of the Post-Office Department for the quarter ending December 31st, 1879, sum up as follows, according to the statement made by the Acting Auditor of the Treasury for the Department:

RECEIPTS.	
Amount of letter postage.	\$ 197,468 85
" newspaper postage.	149,005 52
" registered letter postage.	7,402 02
" stamps and stamped envelopes.	1,494,809 77
" box rents.	21,089 45
Total.	\$1,869,775 14

The expenditures, not including inland transportation, were:

Compensation to post-masters.	\$593,853 45
For ship, steamboat, and way letters.	8,673 24
Incidental expenses.	277,938 01
Total.	\$874,513 70

This shows the net proceeds to have been \$985,262 44, being an increase of \$58,555 70 over the preceding quarter, and \$99,110 86 over the corresponding quarter of last year. The amount of postage pre-paid in postage stamps and stamped envelopes during the quarter was \$1,376,691 93.

A NATIONAL BLUNDER.—The Philadelphia North American says that a characteristic blunder was made in fitting out the Paraguay Expedition, by the omission to lay in a sufficient supply of powder. The consequence was that even the peace salutes could be fired from only one or two vessels of the squadron. Had war actually occurred, our fleet would have been in a nice predicament. But undertaking to fight without ammunition, according to the American, was not the only mistake made. The deficiency in powder was made up by an over-supply of coal. Some thousands of tons more than could be burned, sold or brought home, were landed in Rosario, and remain there still, leaving the Administration to foot a bill of \$40,000. Had the Government made the mistake the other way, and bought too much powder, it might now be sold at an advance, perhaps, to the European belligerents; but the Government never has any such good luck. It is sure to make the blunder in the way that will cost most.

EXPLORING EXPEDITION.—There are now two Surveying or Exploring parties employed by the Federal Government, and about taking the field under the direction of the Topographical Bureau. The first is dispatched to explore the San Juan River, in New Mexico, a tributary of the Colorado of the West, and to discover, if possible, a route between Santa Fe and Utah, in the vicinity of the San Juan. The other party is charged with the exploration of the Yellow Stone and Missouri Rivers, a service of magnitude and importance, which will keep the Expedition in the field about eighteen months.

News Paragraphs.

A flood of emigration is coming. Up to the 23d ult., 6750 had sailed from Liverpool for New York in April, and the number was expected to reach 10,000 in the course of the month.

The New York Courier says that the channel in the East River is rapidly closing, and where five years ago vessels of any draft could safely pass, now those of ordinary draft find bottom.

Mr. HENRY BOARDMAN, a nephew of King Glass, of the Gaboon country, West coast of Africa, was married at New York, on Sunday week, to a Miss Evans, a native of Baltimore. Mr. Boardman has been sometime in this country, and has been employed in the translation of the Scriptures into the Mpanga language.

The celebrated Baron Humboldt, the most distinguished name of the age in the various departments of physical science, died at Berlin on the 6th inst. His age was over 90. All the civilized world will honor his memory.

The Legislature of California has rejected the Bachelor's Homestead bill, which proposed to give to men who prefer a life of single blessedness, the same immunity from seizure of their homesteads for debt, as now enjoyed by those who have the good sense to get married.

Two American officers will probably take part in the coming—perhaps existing—war, viz:—Young Jerome Bonaparte, of Baltimore, who is a Lieutenant in the Chasseurs d'Afrique, and Major Kearney, of N. Y., who, it is said, has entered the staff of one of the French Generals of Division, as a volunteer.

The Cleveland Leader says there is quite a stir in Coshocton, Ohio, touching what was supposed to be a silver mine near West Lafayette. It is stated that the ore has been taken to the Philadelphia mint, and was pronounced the richest ever received there, every three pounds of ore making one pound of pure silver. The ore is found in a bed fifty yards wide and three feet thick, overlaid with a vein of lead one foot thick.

Lettians from Montevideo intimate that Lopez is again disposed to be tyrannical, and six Paraguayans and one Englishman of American sympathies have been imprisoned since the departure of our fleet. It was believed that President Urquiza would soon force, by war or negotiation, Buenos Ayres to join the Argentine Confederation.

The Post-Office Department has taken steps to obtain with accuracy the number of letters sent in the mails. New blanks are to be supplied to the Post-Masters, and it is presumed that this report will commence on the 1st of July.

The Rev. Dr. and Mrs. Osgood, of Springfield, Mass., celebrated their golden wedding on Monday week, in company with twenty or thirty children and grand-children, and scores of friends. The occasion was one of unalloyed pleasure to all the participants.

CHRISTIAN ESSELLEN, one of the most accomplished scholars among the German emigration to the United States, died at the Lunatic Asylum on Blackwell's Island, on Sunday week, in consequence of the breaking of a blood vessel in the brain.

They have in Boston, two children, who unitedly weigh less than Tom Thumb. The elder of the sisters is eleven years of age, weighs fifteen pounds, and is twenty-eight inches in height; the younger is aged nine, weighs thirteen pounds, and her height is twenty-six inches. They are perfectly formed, and, says the Gazette, one experiences none of the disgust at looking at them that the sight of a dwarf so often inspires, for nothing can be imagined more ethereal than those daintily formed and fairy little creatures.

The lace makers of Mechlin, who spin the thread for lace and also for French cambrics, are obliged to work in confined, dark rooms, into which light is only admitted partially by a small aperture, and by being thus compelled to pay more constant attention to their work, they discipline the eye and attain the faculty of spinning the flax of that web-like firmness which constitutes the excellence of these two fabrics.

The Albany Journal says that on 'Change, Saturday morning, C. W. Armstrong, Esq., exhibited a sample of 100 barrels of flour manufactured in France, from wheat grown in that country. The flour was landed in Montreal, Canada, and will soon be forwarded to Albany, when it will be offered for sale.

The Havana papers report that two cargoes of African slaves were landed recently on the eastern coast of the Island, supposed to be the two proplelors reported off the Island a few days previously, and which were supposed to be filled with filibusters.

VISCOUNT DE TRILLARD, acting French Charge, is now in Baltimore making contracts, it is understood, for the purchase of several clipper ships for his Government.

A BISHOP TRUSTING IN A SIGN.—The facts in regard to the breaking up of a Methodist Conference in Texas, and the expulsion of Bishop Janes, have already been made public, but there is one incident in the affair which is not generally known. When the Bishop was cornered by the mob he resorted for aid to the Masonic sign. Rev. I. Blackford, in a report of the Conference to one of our Methodist Exchanges says:—"The Bishop in the hour of extremity, gave the Masonic sign, the rabble dispersed and the Conference was permitted to close its session."

A PROFESSOR IN LUCK.—Prof. N. C. Morse, of Louisville, recently took fifty acres of land in West Tennessee on debt, at \$40 per acre. On examination he found that it contained vast quantities of lead, the rocks beneath the soil being lead ore. A thorough test shows pure lead ore to the value of \$6 per cent., and associated with sulphate of baryta, equally valuable as the lead ore. Since the discovery, Prof. M. has refused \$1,000 per acre for the land, and has raised \$25,000 in Cincinnati, where he formerly resided, to build furnaces and commence mining operations immediately.

The News Condenser.

—Wheat is nearly ready for the reaper in "Egypt."
—Professor Agassiz is going to Europe this summer.
—Cincinnati strawberries are in the Cleveland market.
—At one time the late John Jacob Astor was worth \$21,000,000.
—It is said that the French army of the Rhine will number 500,000.
—A man worth \$75,000 recently died in the Illinois State Penitentiary.
—Steam canal packets between Syracuse and Rome are well patronized.
—The King of Siam has a son named in honor of Gen. Geo. Washington.
—They had a heavy frost in and about Warsaw, Wyo. Co., N. Y., on the 18th inst.
—John Appleton, Esq., has resigned his office of Assistant Secretary of State.
—The Arago passed close by icebergs for 12 hours previous to passing Cape Race.
—Our exports to Mexico for last year were \$3,315,523, our receipts from there \$5,477,465.
—A wharf rat weighing thirteen pounds was killed in Portland, Me., on the 16th inst.
—The free colored population of Louisiana are emigrating to Hayti in large numbers.
—The Philadelphia Tract Society has distributed 1,659,045 pages of tracts the past year.
—The Paris Great Exhibition of Fine Arts opened on the 15th inst., but is very incomplete.
—A rising in European Turkey is imminent, and the Danubian principalities are much agitated.
—All the salt-petre in the New York market has been withdrawn to anticipate gunpowder necessity.
—It is asserted by Hungarians in Paris that Kosuth passed through that city about the 1st of May.
—Hon. Peter Mitchell, an old and prominent citizen of Manchester, Ontario Co., died on the 16th inst.
—Four of the men concerned in the outrage at Jaffa, last year have been condemned to the galleys for life.
—Gen. Bonat, a distinguished French General with the army in Italy, died of apoplexy at Suse, on the 4th inst.
—There are in the State of Oregon 185 flour mills, with a capacity of producing 2,500,000 barrels per annum.
—The trustees of the State Inebriate Asylum have issued an appeal to all the churches of the United States for aid.
—The report of the Sleekies trial sent by telegraph contained 152,140 words, and cost the Associated Press \$3,952 29.
—William L. Patterson, of Mississippi, has been appointed by the President Consul of the United States at Genoa.
—It is said by many of the Western papers that prices of lumber will rule unusually high throughout the coming season.
—A man one hundred and two years old entered a quarter section of land at the Menasha Land Office, on Friday week.
—Wall street, which is about half a mile long, has 6,000 inhabitants and forty miles of stairway, so says a letter carrier.
—New York city, it is estimated, consumes seven million bushels of oysters annually, valued at seven million dollars.
—According to the calculations made regarding the old muskets, every man killed in battle had cost his weight in lead.
—New potatoes were dug from the open ground in the garden of Daniel Russell, in Portland, Conn., on Monday week.
—An individual at Cornwall, England, has made himself a complete suit from 670 rat skins—using tails in the neck tie!
—The numerous arrivals from sea the past few days report heavy winds, and many icebergs were seen as late as April 30.
—The Italians residing in Richmond, Va., are forming an association to raise funds for transmission to their brothers in Italy.
—In the city of Montreal there are nine thousand and five hundred legal voters. They are Registered in the City Clerk's office.
—Salom, Mass., believes in trees. There are two thousand six hundred and fifteen trees on the streets, commons, and squares.
—Active steps are being taken in order to have the Great Eastern ready for sea by the latter end of July, or the beginning of August.
—The Churchman states that Bishop Potter, of the diocese of Eastern New York, has confirmed 1,986 persons since the 4th of March.
—The Russian official journal declares in the most positive manner that there exists no treaty of alliance between Russia and France.
—The Common Council of Cincinnati has just authorized a loan of \$100,000 to be expended in the erection of school houses in that city.
—Letters from Gen. Pierce say that he will probably remain another year abroad, in consequence of the improvement of his wife's health.
—The Seneca Falls Knitting Factory has a contract to make socks for the United States Army. One thousand pairs are produced daily.
—Since the first of January foreign goods to the value of five and a half million dollars have been imported into Philadelphia direct.
—The wheat crop in the vicinity of Augusta, Ga., is quite matured, and will soon be gathered and placed in market. It is generally very fine.
—The husband of the daughter of Mr. Corcoran, the Washington Banker, receives with his wife, if rumor be true, a bridal present of \$1,000,000.
—The people of Woodbury, Ct., are going to have a Centennial Celebration on the 4th and 5th of July next, with his historical addresses, poems, &c.
—The Canadian Legislature has addressed an invitation to Queen Victoria to be present at the opening and completion of the Victoria Bridge in 1890.
—There are no less than 4,000 Lodges of Free Masons in the United States, nearly all of which are said to be in an unusually flourishing condition.
—The Rev. Alexander Gregg, of South Carolina, has been unanimously elected Episcopal Bishop of Texas by the Episcopal Convention at Galveston.
—The Vienna correspondent of the London Times says Austria can keep 600,000 men on foot; Prussia 400,000; and the other German States 250,000.
—A Connecticut deacon utters this sound advice: "There are three things in the choice of which you should not hurry—a wife, a minister, and a horse."

NOW READY—THE ATLANTIC MONTHLY

you, or for any of your friends.

Written for Moore's Rural New-Yorker.
ALL EARTH IS BEAUTIFUL.

Oh, tell me not this earth is all
A scene of foul decay,
That o'er its joys a funeral pall
Is spread in dark array.
Oh, tell me not there is no love,
No beauty here below,
For God, from higher courts above,
Hath blessed all things below.

There's beauty in each tiny flower
That blooms along the way,
Or decks the cool and shady bower
In rich and bright array!
There's beauty in each forest tree
That shades the passer by,
There's music in the tiny bee
That hums his busy lay.

There's beauty in the mountain rill
That flows along the glade,
There's beauty in the rugged hill
And in the forest shade;
There's beauty in the summer day,
There's beauty in the night
That comes to us with gentle lay
And happy visions bright.

There's beauty in the summer cloud
And in the April shower,
For these our All-Wise Father gives
To gladden leaf and flower!
Oh, yes, all earth is beautiful
With every varied scene,
For whoso'er the eye may gaze
The Hand of God is seen!

Princeton, Ind., 1859.

Written for Moore's Rural New-Yorker.
MATTIE'S MISTAKE.

BY ELLEN C. LAKE.

COTTAGE, April 18.

I AM going to write you a letter this morning, dear ABIE LINTON, so erase at once the long line of black marks which I doubt not you have placed against my name in your heart-book, disperse from your busy brain the manifold cares of your matrimony, and listen to me, the "wilful and untamed" of our school-girl days, but now, alas! for the romance-killing effect of years and matrimony, transformed into the staid and yielding spouse of one HENRY GRAVES.

I can see just how you lift your hands and open your eyes, ABIE; I know just what an exclamation of wonder and surprise will spring to those saucy lips of yours, but to all that you may think, or do, or say, I only drop a very demure "curtsey,"—as Miss PRIN used to have it,—and repeat my assurance that "years and matrimony" have worked a great, and, I fancy that I may add with propriety, a miraculous change in the friend of yours who once bore the name of MATTIE SOMERS.

You hadn't heard of it, had you? I have taken all possible care that you should not, a fact for which you will doubtless think of calling down "inverted blessings" in my behalf, but don't do more than think of such a proceeding, for I am free to assert that when my motives are explained, you will find good in the seeming ill.

Such long, quiet talks as we used to have in that room of ours at H— school—such castles as we used to build—and such wild, romantic fancies as sprang to life in our maiden brains—fancies at thought of which I smile now, for, do you remember, they were mostly of some "lone sequestered dell," where, in "maiden meditation fancy free," we were to spend our lives untroubled by the obnoxious presence of the masculine gender—where the "lot" of woman would not blast our hopes, break our hearts, and consign us to early graves.

Do you remember, too, how we denied ourselves all little luxuries that we might purchase linen for our "old maid's hall"? Well, one of those same napkins I have been laying beside my "cara sposa's" breakfast-plate to-day, a fact which proves very effectually, to me, the "vainness of earthly hopes." But perhaps it is not a laughing matter after all.—It was a crying one for me, when Cupid shot an arrow through JOHN LINTON's heart into yours, and I was obliged to witness the sacrifice.

Perhaps you remember that I was, or tried to be, extremely unconcerned, but it was with an uncomfortably heavy feeling about the heart that I caught my last glimpse of you on the morning of your marriage, and after you were fairly gone, the tides that had been rising so long within, had their own way as to overflowing.

It was not to be wondered at, I presume, that I grew low-spirited, alone with my servants in the great, vacant-seeming house; which, lacking the presence of those who had so early left me, could be in no wise home, and it was not long before I came to a very positive conclusion that I should not stay in it.

I had read in the papers left by my father at his death, of a small property in the township where he was born, which, it struck me, would be a suitable place for carrying out the project we together had originated, but which I alone was to execute, so with my usual and rather stubborn decision, I immediately set about preparing to take possession of my country residence. ANNA, my "maid of all work," was to accompany me, and as she was about as ignorant of country life as I, we were neither of us troubled by a doubt as to our getting along without a man's assistance, though whether she shared my aversion to the sex, I have reason to doubt.

Well, in due time our plans were put in execution, and one bright afternoon in Spring we reached Welton. I was in ecstasies at the aged and time-worn appearance of my domicile, built in the fashion of an old, old time, with gables and turrets, crooks, windings and turns, such as I am sure now, no woman untouched by an old maid manner would think of enduring. That I was not untouched I think you willing to concede, when I tell you that

so much was my natural disposition changed by the engrafted ideas that I—actually I, who used to call a servant to bring me a book—helped ANNA carry our trunks from the gate, where they were left by the coachman, to the porch; unpacked their contents, and arranged a room for our occupancy before I slept that night, dreaming wondrous dreams, when I did sleep, of the rights and dormant faculties of womankind. We prospered finely for a few days, but the time came when we had burned the last stick we could lay hands on, and began to realize that something must be done. ANNA would not dare, she said, to go out alone, so after a good deal of hesitation I donned my plainest garb, and we went together to the nearest farm house. Now, I'm a bit proud of the titles of my ancestors and the blood in my veins, as you know, and I can tell you that the latter boiled some when, in answer to our summons, a red-faced servant girl opened the door, who, after a deliberate survey of our persons, said with a broad accent and a broader sneer,—"Sure, and where did ye's come from?"

"The next house," said I, shortly.
"We don't have such here," was her answer, shutting the door in our faces, and there we were, strangers, with that emphasized "such" ringing in our ears, and the comfortable assurance that the girl's opinion of us was copied from that of her betters.

We were turning to leave the house when an elderly gentleman, closing the front gate, came up the walk toward us. He bowed, politely but coldly, and remembering our need,—an urgent one, you will admit,—I ventured to state the case to him.

"I will see that you are supplied," was his answer, ascending the steps as he spoke, and we had nothing more to do but regain our lodgings. I don't remember exactly whether I laughed or cried about it, but I guess a little of both, for though the treatment we had received was exasperating, the real state of the case was quite ludicrous enough to warrant a hearty laugh—which I doubt not you will indulge in.

Our fuel made its appearance that afternoon, and I was quite regaining my "mental equilibrium" when ANNA asked my orders for tea, adding, at the same time, with a look that told her appreciation of our situation, that there "wasn't so much as a dust of flour in the house."

My enthusiasm was cooling very rapidly, but after taking myself to task for the "womanly weakness" of fearing the tongue of "they say," I tied my bonnet-strings very firmly, armed myself with my porte-monnaie and "sallied forth." The first shop at which I stopped was full of men, and my errand there was a vain one, for they either had nothing, or were ignorant as to the existence of the coin I carried. At the next I succeeded better, but had the pleasure of feeling that two pair of feminine eyes were taking notes of my proceedings, and laying up for future use a large quantity of food for scandal, while—alas, for my boasted strength and independence—I had not the slightest armor for protection of feeling.

But you have "seen the end from the beginning," I doubt not, and I am not going to furnish you with more laughing material from the history of my trials at present; trials which ended at last in the complete overthrow of my theory, and defeat of my heroism, as you have already guessed. I returned to the city a wiser and, in some things, perhaps, a sadder woman than when I went away, but the "entree" into society which I accomplished under the chaperonage of an old maid aunt in the course of the following winter, served to dispel very effectually the last remnant of my school-girl romance, for (attracted more by my "dimes" than my dimples, I doubt not,) I had so many on my list of admirers who were ready to spring at my slightest bidding, that I found it quite uncomfortable for me to dispense with even the lip-service of the "lords of creation."

It was a vain, almost a wicked life, ABIE, and looking with a happy heart and loving eyes at the home and the home-rest which I have found at last, I think the stars of my fate that the life within me has grown too deep with earnestness and too strict in honesty for such a sphere.

But who is HENRY GRAVES? I know that you are beginning to ask the question rather impatiently, and you shall be kept in suspense no longer by my wandering pen. Here I can write up to the rules of romance for it was at the "last party of the season," and at a moment when, "weary of the festivities," I fled "withdrawn to a shadowy recess" that an old friend of my father's presented to me a young friend of his own, who was no other than this self-same HENRY GRAVES. I remember nothing peculiar about this first interview of ours, more than that I found my companion of the half hour following our introduction, possessed of more sense and less folly than most of the young men who danced attendance on the aforesaid dimes, and concluded that he would do to retain in my "list."

I am quite sure that I have not the least talent for writing "love stories," so you will have to imagine all the dramatic passages and tender scenes which occurred (or rather might have occurred, I don't say that they did) in the course of a love which, though it ran smoothly, I believe to have been and to be, "true as steel."

I knew little about my husband's relatives before our marriage, and in the bustle and excitement previous to the "final end," did not think when he told me the name of the town where they resided, that it was the same as the one where I had spent or attempted to spend the summer of the year before. But when, in the afternoon after our marriage, I found myself in a carriage which stood before the door, what had once been closed in my face, I began to realize my whereabouts, and feel, as well, a slight stirring of mischief within me.

The girl who had performed the afore-mentioned act for me, was not to be seen and had probably been discharged, but the gentleman whose opinion of me had been so legibly written on his face stood at the gate and had fairly grasped the hand of his new daughter, before, as I threw up my veil, he recognized an old neighbor. I cannot, in any measure, give you an idea of the perplexed and astonished expression that swept over his countenance, but after a moment of hesitation he recovered himself and led the way to the house.

I could see that he was woefully puzzled, yet decidedly fearful as to the effect of the queries he was tempted to make, so, in pity for his embarrassment, I mentioned, casually, in the conversation which followed, the fact of my having once been a resident of the "ruined castle" adjoining his farm, together with the motives and result of my adventure. It would have done you good to see his face brighten, and, seeing through the sport I was having at his expense, he joined in it so heartily that we were all like old friends at once. HENRY had been from home when I was there, and had known nothing of the trials and tribulations of my attempt to lead a single life, for, of course, I would be the last one to tell him.

But such a long letter as I have made of this—I elect you the medium of my respects to your "better half," and add,—par parenthesis, as something of a moral to the tale I have told—the confession of MATTIE SOMERS that when she deemed herself, (in the singular number, possessive case, to no man,) self-sufficient for battle against labor, life, and above all, scandal, she was simply—mistaken.

Written for Moore's Rural New-Yorker.
MARIAN CROSS.

ALL that dark, cloudy November day I had been listlessly gazing out at the sullen-looking sky, vainly hoping to get a glimpse of a single ray of sunshine, or at least one little, bright cloud to relieve the general dreariness,—but no, it still kept raining, raining. Turning moodily from the window, I caught up the fragment of an old newspaper, and as I read the words, blotted and almost effaced by age and use, I forgot that the day was "dark, and sad, and dreary." In thought I went back to the time when I made one of the merry group at the old red school-house upon the hill. I had seen the fading leaves of only twelve Autumns then, the days all seemed bright, and earth very joyous to me, yet I had learned that it was not so to all. I knew that among the youthful band who gathered there day after day, there were some who trod the life-path wearily—despairingly. And as I read

"She was not beautiful, poor girl,
Her figure or her face
Had none of all the charms that give
To maidenhood its grace,—
One of those beings upon whom
All sorrows seem to fall,
Deformed and homely, poor and sad,
And mind to feel it all,"

the pale, sad, thoughtful face of MARIAN CROSS, came up before me, as seated alone at her desk, she industriously committed to memory lesson after lesson, heedless of the busy hum around her, or, standing a little apart, watched us in our noisy sports at play hours. Now and then our lively sallies would cause a faint smile to light up her face, but it quickly faded, and the same mournful look would again take its place. We sometimes wondered why she was sad, yet never paused to consider whether we could do ought to make her life more pleasant.

Once, at her request, I went with her to her home, and from that hour her sad looks were no mystery to me. I will not attempt to describe that home,—I felt that its very atmosphere was enough to chill every joyous impulse. I wondered if the sunshine ever entered there,—sure was I that the sunshine of love never did, or it would have been a happier one.

Her harsh, unfeeling, intemperate father; rough, clownish brothers, and careless, selfish sisters, had no sympathy for the timid, sensitive child; and her patient, over-taxed mother had no time to devote to her, and from others

She never sought a smile
To cheer her lonely heart,
But by herself, with shrinking step,
She struggled on apart.

After a time the gloomy old house she had so long called home was exchanged for a pleasant one, but more agreeable associations, or all the glowing beauties of earth that surrounded her, had no power to bring happiness to her desponding heart. There came also a change in the household, some had found other homes, death had removed the mother and a sister, leaving of the group that once gathered at the homestead only MARIAN and her father.

Many a long, long day—yes, even weeks,—she spent then alone, sorrowful and disheartened.—Friends endeavored to cheer her with words of kindness and encouragement, yet her pale cheek grew paler, her step slower, and her slender form bowed beneath the crushing weight of sorrow which rested upon her young heart, slowly, surely wearing her life away. The look of quiet, patient endurance which was ever upon her face, we felt, as we stood beside her last resting-place, came not from a meek, forbearing spirit, or she would have waited patiently until God called her to a happier world.

Poor MARIAN! she was alone in the hour of death; none knew when it came. A friend hearing that she had been many days alone, and wishing to spend a little time with her, entered the house on beautiful autumn morning, and found her sleeping—sleeping the peaceful, dreamless slumber of death. By her side stood the cup that had contained the deadly draught; the hand that prepared it yet remained clasped over the heart, which had ceased to beat; around the cold lips still lingered a smile,—the weary one was at rest.

In tearful silence friends gathered as they learned the sad story, but there was none that could answer the half-uttered words of inquiry that rose to every lip—none but the Searcher of all Hearts knew how deep was the anguish, how strong, how alluring the temptation which caused her to commit the dreadful deed. Slowly, sadly, they bore her to her last resting-place, gently they laid her down to repose beneath the green turf, and now but few can tell

Where blooms the clover, white and red,
That nature kindly rears
To guard the slumbers of the child
Of poverty and tears.

Oakland, N. Y., 1859.

Most of their faults women owe to us, while we are indebted to them for most of our better qualities.—Lemuel.

For Moore's Rural New-Yorker.
MISCELLANEOUS ENIGMA.

I AM composed of 44 letters.
My 24, 3, 24, 25, 23, 19, 17 was an ancient city.
My 9, 7, 24, 22 are a kind of potato.
My 26, 4, 37, and 17, 6, 30, 5, 31, 37, 34 have no enemies but the ignorant.
My 25, 43, 39, 21, 8 hides our own faults.
My 22, 40, 36, 13 is compounded chiefly of mineral substances.
My 18, 12, 11, 18, 33, 17 are of both the head and heart.
My 25, 4, 43, 36, 22, 5 owes its value to its scarcity.
My 1, 26, 43, 22, 15, 14 was the capital of Poland.
My 2, 7, 4, 32, 18, 40, 43, 35 has a retreat for the insane.
My 41, 15, 8, 17, 34, 24, 10, 30, 21 is a variety of sweet potato.
My 37, 5, 44, 18, 10, 8 is an island belonging to the British.
My 17, 5, 29, 37, 33, 8, 13, 18, 34 are islands in Africa belonging to England.
My whole is a conundrum. MOLLIE.

Answer to Miscellaneous Enigma:—Nothing suffers from free discussion.
Answer to Arithmetical Problem:—18.679 plus inches in diameter and will hold 5.3074 plus gallons.

Wit and Humor.

MY WIFE.

She tied the new cravat
Which she so kindly made me;
Then smoothed with care my hat,
And with her arms delayed me;
She brushed my "glossy hair,"
And said "it was so curly!"
While going down the stairs,
She cried, "Come home, dear, early!"

How happy then was I,
With all I'er desired;
I fortune could defy
While thus I was admired!
We parted at the door—
Her smile deserved a sonnet!
"Dear love, but one thing more:
I want—a new spring bonnet!"
(Home Journal.)

How HE DID IT.—I gave her a rose and gave her a ring, and I asked her to marry me then; but she sent them all back, insensible thing, and said she'd no notion of men. I told her I'd oceans of money and goods, tried to frighten her with a growl; but she answered that she wasn't brought up in the woods to be scared by the screech of an owl. I called her beggar, and everything bad; I slighted her features and form; till at length I succeeded in getting her mad, and she raged like the sea in a storm. And then in a moment I turned and smiled, and called her my angel and all; she fell in my arms like a wearisome child, exclaiming, "We will marry this fall."

A GOOD ILLUSTRATION.—In a time of much religious excitement and consequent discussion, an honest Dutch farmer on the Mohawk was asked his opinion as to which denomination of Christians were on the right way to Heaven. "Vell, den," said he, "ven we ride our wheat to Albany, some say this road is the best, and some say dat—but it don't make much difference which road we take, for ven we get dare dey never ask us vich way we come—and it's none of their business—if our wheat is good!"

WHEN Jimmie went to school, she was asked why the noun bachelor was singular. "Because," she replied, "it is so very singular they don't get married."

Rochester, N. Y.
TENTS AND FLAGS to Rent, suitable for Agricultural Fairs, Military Encampments, Conferences, Camp Meetings, &c., &c.
Having the entire stock of Tents formerly owned by E. C. WILLIAMS, with several new ones in addition, I am prepared to fill all orders the public may feel pleased to honor me with. Tents and Flags of every description made to order. Address JAMES FIELD, Box 701, Rochester, N. Y. 430.

STOVE YARDS FOR 1859.—RATHBUN & WHITMORE have always on hand a good supply of Lockport and Medina Stone, Cape Silla, Platforms, Steps, Posts, and all other articles, adapted to all kinds of work and every variety of ground; light draft; low price; freedom from side draft, clogging, and pressure upon the horses' necks; portability; perfection of work; and these desirable features are combined in the above machines. The American Harvester is a two horse machine capable of cutting from 10 to 15 acres of grain, and from 12 to 18 bushels of grain per day. The Little Buffalo Harvester is a one horse machine capable of cutting from 8 to 12 acres of grain, and from 10 to 15 acres of grain per day. PRICES AT FACTORY. American Harvester as Mower, \$105 00 Combined, 125 00 Little Buffalo Harvester as Mower, 80 00 Combined, 100 00 Manufactured by the BUFFALO AGRICULTURAL MACHINERY WORKS, Buffalo, N. Y., and D. M. OSBORNE & CO., Auburn, N. Y., and for sale by their agents, and by mail. A Catalogue containing full descriptions of the Machines with Testimonials, accounts of Trials, &c., may be had by applying to the Manufacturers or any of their Agents. 434.

MANNY'S COMBINED REAPER AND MOWER, WITH WOOD'S IMPROVEMENT, FOR THE HARVEST OF 1859.
The subscriber begs to inform the public that he continues to manufacture this popular machine, and pledges himself to produce an implement that will fully sustain its former reputation, as the best combined reaper and mower yet introduced, and inferior to none, either as a Reaper or Mower. It has had a steady and increasing popularity from the first, achieving a complete success in the first important trial at Geneva in 1852. It carried off the highest prize at the National Field Trial at Syracuse in 1857; and amidst all the competition and trials of 1858, came out with more and better results than any other machine. The general principles peculiar to this machine, and upon which it is constructed, have proved so successful that there has been no attempt to change them. The main effort during the last year has been to improve its mechanical construction, to make it stronger and more durable, and sustain its reputation as the leading and most acceptable machine to the largest class of farmers in the country. Warranted capable of cutting from 10 to 15 acres of grain or grain per day, in a workmanlike manner. Price of Machine as heretofore, varies according to width of cut, and its adaptation in size and strength to different sections of the country, from \$125 to \$180, delivered here on the cars. Manufacturer and Proprietor, HOSICK FALLS, N. Y. BENNETT GRAY, Brockport, WM. HENRY HARMON, Scottsville, Agents for Monroe County, N. Y. 433-4.

WOOD'S MOWER.—Patented February 22d, 1859.
During the six years I have been engaged in the manufacture of the Manny Combined Reaper and Mower, I have given much thought and attention to the construction of what I foresaw would be a great want of the Farmers—a lighter and cheaper machine expressly for mowing, than had yet been made. And now, after the most thorough and repeated experiments and tests in every variety of field, and in all kinds and in every condition of grass, I am prepared, with entire confidence, to offer to the farmers and dealers of the United States, the great desideratum in this department of agricultural labor-saving machines—a superior machine in its capacity for good work to any hitherto introduced, of easy draft, light, cheap, and durable. This machine I now offer as my latest invention, to meet a special want of farmers, and to place within the reach of all a Mower that for practical working, cheapness and simplicity, will be without a rival. It has Two-Horse and One-Horse Mowers. The Two-Horse Mower weighs 425 lbs., and cuts a swath four feet wide (or more if specially ordered). The One-Horse Mower weighs 300 lbs., and cuts a swath three and a half feet wide. For a more full description of the Mower, reference is made to my Pamphlets, which will be furnished on application.—With each machine will be furnished, in extra guards, two extra sections, one wrench and oil can. Warranted capable of cutting ten acres of grass per day in a workmanlike manner. Price of Two-Horse Mower, \$80 One-Horse Mower, 60 Delivered here on the cars. I continue as heretofore, and with greater success than at any previous time, the manufacture and sale of "Manny's Patent Combined Reaper and Mower with Wood's Improvement." Manufacturer and Proprietor, WALTER A. WOOD, PEASE & EGLESTON, 64 State St., Albany, Agents for Albany County and vicinity. BENNETT GRAY, Brockport, WM. HENRY HARMON, Scottsville, Agents for Monroe County, N. Y. 433-4.

THE COLEMAN FARM MILL.—The wonder and admiration of the age; every farmer his own miller; GREAT SAVING OF TIME AND EXPENSE. The only successful Metallic Mill ever invented for making Buckwheat and Flax Flour. It can be run by Horse, Steam, Wind, or Water-Power. Price with Selves arranged, for sifting Corn Meal for family use while grinding, \$100. Price with Bolting Machine attached, for making Family Flour, \$175. Descriptive Circulars can be had, or the machine can be seen in operation at the Office of the "Coleman Farm Mill Company," Tribune Building, No. 7 Spruce Street, New York, where all orders will receive prompt attention. 467-361. MARTIN THATCHER, Sec'y.

JAMISON AND ENSIGN, ATTORNEYS AND COUNSELLORS AT LAW.—Office, No. 60 Main street, (over Lockport Market.) Lockport, Niagara Co., N. Y. Real Estate, and Michigan lands for sale or exchange for real property in Western N. Y. Loans negotiated. A. H. JAMISON. 473. A. J. ENSIGN.

BUTTER MAKING.

THE ART OF MAKING BUTTER is but imperfectly understood over a large extent of the Union, if the products of manufacturers of the important staple are taken as a criterion. If not one of the *last arts*, it is certainly sadly neglected, to the great disadvantage of producers, and disgust of consumers. The little thought and attention given to the subject by the great mass of farmers, has long been matter of surprise to those who appreciate the difference in the value of a good and inferior or worthless article—and yet, though there is scarcely any branch of husbandry which has been more reliable or steadily profitable for the past ten years, little brains and pains are devoted to the improvement and perfection of the products of the Dairy. True, there are limited districts in which a prime article is produced, but we do not believe, as many affirm, that it is solely or mainly attributable to the fact that such districts are well adapted to dairying,—but that good butter and cheese may be made in other sections (not to say all,) by the exercise of proper care, skill and judgment. The high reputation of Orange County Butter, for instance, is owing in a great measure to the manner of its manufacture, packing, &c.; and the same is true of Philadelphia butter, as well as of that of other sections which have acquired a reputation in the leading markets.

We apprehend that the *uniformity* of the manner of making and packing has been the great secret of the success of the butter dairymen of certain localities, and hence that many other sections could successfully vie with them in the production of a superior article, by adopting proper and uniform rules in manufacturing. As good butter is made in this County, as in Orange or other famous butter making districts, yet not over one producer in twenty makes a good article. And why? Simply, we apprehend, because they do not know how, nor care to learn. This having been a grain growing region, few have given special attention to either butter or cheese making; and now that more attention is necessarily turned to dairying, (in consequence of the failure of wheat,) the great mass of farmers seem to lack knowledge as to the requisites and modus operandi. A few seem to understand the business, and their butter sells readily at from 2 to 5 cts. per lb. above the market price—but, as already intimated, most of the butter brought into this market seems to have been made by guess work or at hap-hazard. Each dairywoman has her own "notions" about making butter, and very few, we fear, understand the correct process, or do not "take pains" to produce a fine article.

Western New York is becoming, to some considerable extent, a grazing and dairying region, and it behooves our farmers to give this branch increased attention. We do not say that they can successfully compete with the celebrated dairy sections, but we know they can produce butter and cheese profitably, and believe that in time an enviable reputation might be established in the large markets—such as has already been acquired by certain producers and localities of Western New York. To aid so desirable a consummation, we propose to give, during the season, such information as we believe will tend to the result. In former volumes of the *Rural*, we have published much on the subject of making butter and preparing it for market, yet as the matter is one of increasing importance, and as every year brings us thousands of new subscribers, it becomes necessary to recur to the subject but to discuss it so as to be thoroughly, annually. In a few weeks we shall publish a valuable and original *Prize Essay* on Butter Making, which discusses the whole subject, including the Best Breeds of Cattle; the use of Food, Exercise and Shelter; Dairy Dairies; the Cows; Dairy Apartment; Care of Milk; Winter Care of Milk; Churning; Working the Butter; Final Packing. We also invite expe-

rienced and successful Butter and Cheese makers to contribute to the pages of the *Rural* the most approved modes of manufacture. Meantime we give the following extract from an article in a recent number of the *New York Tribune*, furnished by Dnaw & Frazer, Commission Merchants, who deal largely in dairy products. It contains some valuable suggestions in regard to the making and packing of Butter for the New York Market:

While local characteristics are prominently marked, the difference in quality resulting from different degrees of skill and care in the makers of the same section is no less striking, some dairies bringing, in the same state of the market, 2 to 8 cents per pound more than others from the same neighborhood.

Much has been said and written on the art of Butter-making. We trust some good has resulted from these efforts, but still a very large proportion of the butter sent to market is of inferior quality, and sells at low prices, though more labor may have been bestowed upon it than upon the very best.

Nothing pleases commission merchants more than to receive a strictly fine dairy of butter—sweet, yellow, rosy to the smell, and delicious to the taste. It sells readily at a satisfactory price, and everybody is pleased, from producer to consumer. Common and inferior butter sticks, notwithstanding its *greatness*, at every stage, causing dissatisfaction and trouble from beginning to end. It is either colorless, milky, sticky, over-salted, under-salted, strong, rank, or rancid, or all these combined—at any rate, it is not what it should be.

Without pretending to a practical knowledge of butter-making, we herewith condense some of the principal conditions and requisites for making first-rate butter as we have been able to gather from various sources.

We will thank any first-rate butter-maker for additional hints or criticisms of what we have herein stated.

Conditions Requisite.—First: Cows of good milking quality; some good butter-makers think selected breeds the best.
Second: Food.—One of the most experienced and best butter-makers in the State, recommends a mixture of grasses, such as red and white clover, timothy and blue grass. Keep the pastures free from rank and strongly flavored weeds. Pungent roots and vegetables, such as turnips and cabbage, will injuriously flavor the butter, and injure its keeping qualities. Pumpkins and carrots are the best vegetable food when the season of grass is over, and give a fine color to the butter; but ground feed, such as the bran of wheat, rye, and corn, or ground oats, is believed to be best in winter, as it keeps the cows in thriving condition, without too much increasing their fat, and makes the best-keeping and best-flavored butter.

Third: Keep the cows quiet, particularly during the warm weather. The milk from cows when in the periodical fever, or when heated from any cause, will not make the best-flavored or best-keeping butter, and should be rejected from such use.

Fourth: Keep the atmosphere of the milk-room perfectly fresh and pure, and at as even a temperature as possible—it should not be warmer than 65 deg. Fah. As soon as the milk coagulates, or just before this change occurs, it is ready to be churned, or skimmed. Some of the best butter-makers churn the milk with the cream, others skim and churn only the cream. When skimmed, the cream may be kept in the creamer six to twelve hours, occasionally stirred, but never covered. Tin pans are commonly used for setting milk, but tin pails, holding twelve quarts, are preferred by some of the most skillful.

Fifth: The contents of the churn should be at the temperature of 64 deg., and the dash should be moved at the rate of about 50 strokes per minute; neither hot nor cold water should be turned into the churn to regulate the temperature. Setting the churn in hot or cold water is a better way; hot water turned into the churn injures the color and grain of the butter. Soft water is indispensable for washing butter to the best advantage. If you cannot get soft water otherwise, save rain water and cool it with ice. The water from ice is always soft. When thus washed it is ready for salting. When the conditions are right the butter will "come" in 20 to 30 minutes. When done, the butter should be taken from the churn and thrown into a smaller vessel, partly filled with water, at 43 to 44 deg. Fah., and the buttermilk forced out with a small dash or ladle; then put in trays and wash until the water used ceases to be the least discolored with buttermilk. The great point to be attained in washing or working butter is to expel all the buttermilk without overworking the butter, which spoils the grain, and renders it sticky or greasy. After the butter has stood in the trays about twenty-four hours, and been worked lightly three or four times, it is ready for packing. Some good butter-makers do not work so many times. It should never be worked in a dry state or without water, as that would injure the grain and damage the flavor at once. After the skin or tub is filled the butter should be covered with a thin piece of muslin, and the whole covered with strong pure brine, which must not be allowed to evaporate or leak out.

Over-salting is one of the most common faults of butter-making. Not uncommonly coarse salt is used in such quantities, and with such treatment, that it remains undissolved, and will grate in the teeth. Such butter must be sold from 3 to 5 cents per pound lower on that account.

Butter Packages.—White-Oak Firkins, with smooth, round hickory hoops, holding about 100 lbs., are most largely used, and decidedly the best when the article is to be kept long time—no other can be used for shipping. Half skin tubs, or the regular firkin saved in two, with a flat cover pulled upon the top, is a favorite package for choice Butter. Welsh tubs, or tubs with

THE RURAL'S PREMIUM BARN.—No. III.

HEREWITH we give the BARN PLAN to which the Committee awarded the *Rural's* third premium. This Barn is owned by JAMES WHITNEY, of Big Flatts, Chemung County, N. Y., who furnishes the following description:

Messrs. Editors:—I have the name of having the most convenient Barn in our part of the country, and accordingly have made a draft to the best of my ability, being nothing but a farmer. I think, however, I understand the wants of farmers better than the mechanic or architect can. You will discover I have an elevation of ground nearly eight feet, which is some four rods north of east and west road, and slopes towards the south-west. I have cellar under barn and east shed, the north-east corners in the bank. East and north stone wall for barn is nine feet high, and that for shed is six feet high.

GROUND PLAN OF LOWER STORY.

Standards for tying cattle. F, Lower Feed Room in front of cattle, 4 by 64. G, Bunks for Cattle, 9 by 64. H, Doors. I, Manure Cellar under east shed, 16 by 24. J, Open Shed. K, Horse Stalls, 10 by 30. L, Horse Bunks, 2 by 28, (hay from above, and grain in front of horses, by falling doors in ceiling.) M, Stairs. N, Halls in Granary. O, Root Bins. P, Cleaning Floor and Weighing Room, and Feed Room for horses, which does not freeze in winter, 18 by 24.

I enter the barn from the north with team on

upper floor, thrash with a self-cleaning machine, and have straw-carrier attached, so that I can run the straw in either shed I choose. I have two good Bays without incumbrance from stabling or granary, and spouts or conductors marked, corresponding with bails in granary beneath, to conduct the grain where I wish; and this, when thrashing, saves at least one man's labor. Two men are sufficient to take care of straw from a good eight-horse machine, and it is all secured from wind or storm.

PLAN OF UPPER STORY.

A, Stairway to Stable. B, Space for letting hay down to story below, for horses. C, Trap Door, to throw manure down from cattle sheds. P, P, Openings to let feed down. D, Floor for storing fodder, 25 by 64. E, West Bay, 10 by 30. F, Upper Barn Floor, 18 by 30. G, Cattle Stalls, 9 by 24 and 9 by 32. H, West Bay, 18 by 30. I, Loft of Lean-to, 10 by 20.

My Basement is dry. Sills two feet from ground. My grain has never mustered nor wet, and feed never frozen in winter. I have twelve Grain Bins, so arranged that I can get to any one of them when I wish, capable of storing over 3,000 bushels, and four Root Bins, which will store about 800 bushels, where they can be seen to at any time.

My stone wall is laid in mortar and pointed; the frames are all made of square timber and joist; no round timber anywhere about; outside, all planed and painted. The Basement Story is eight feet;

barn posts 18 feet long; the Long Shed is 25 wide, 64 long; posts 20 feet. East Shed posts nine feet long.

The cost of Barn without sheds \$400, including board of hands; can be built \$50 cheaper without planing or painting. Sheds cost \$450, including board of hands, and can be built for \$400 without planing or painting.

My mode of fixtures for tying cattle is much cheaper than the ordinary way, besides being much more comfortable for the animals—it is as follows: first, I set my standards four feet apart, have a ring made of three-eighths or half-inch iron about six inches across, put over the standard, and then put the bow through the ring and over the animal's neck. The operation is shown in the engraving. Have a piece of hard wood for a latch one inch thick and eight inches long, 1 1/2 inch hole at one end, and one inch at the other. The bow needs a knob on one end and notch in the other. This, I have also endeavored to show in the engraving. The rings will slip up and down to suit the animal's convenience. They can lay down and turn their heads around on their side, and they can lay much nearer than if fastened in any other way, and if you have an animal that is inclined to be masterly you can make him keep his head on his own side, by putting a board on one side or the other to suit

a, Bow, attached to ring. b, c, Ends of bow. d, Hard Wood Latch, showing holes for ends of bow.

your convenience. Thus you can control the most vicious of animals, and make them perfectly submissive. I have adopted four feet apart for my standards, but they will do much nearer for small animals.

straight staves, largest at the top, with cover or lid shutting over and strapped down with pieces of leather or tin, are much used in some sections. They are very convenient for the domestic trade. They are commonly made of ash, which is next to white oak for this purpose. Maple, whitewood, and other soft woods, are unfit, as they soak largely and impart injurious flavors to the butter. Butter may be advantageously kept under brine while at the dairy, but when finally closed up for market the pickle should be carefully turned off and a cloth wet in strong brine spread over the top. The top head of the skin or the lid of the tub should never touch the butter.

ON KEEPING LIVE STOCK.

WHY DO WE KEEP LIVE STOCK? The correct answer, doubtless, is, that live stock changes for us certain products of the land not marketable, or not good for human food, into other products available for both those purposes; or by such aid we can change products of less value into other products of greater value. Of the products which we desire thus to change, grass is the chief. By the aid of live stock we can convert grass into meat and its accompaniments, milk and its products; or into wool.

Now, if the answer given be correct, then it follows that it is the business of stock to consume food, and it is for the farmer's interest to furnish it in abundance. The greater the quantity of food consumed without waste, the larger the remuneration we receive. Also it follows that the question should not be, how many animals will a pasture preserve in life, or how many our winter forage will keep with the skins and bones together, but how many will consume the unmarketable products

which our farms yield, to the greatest profit. Experiment will prove that abundant feeding is decidedly for the farmer's advantage, both in summer and winter. When the Western country, where I live, was new, the wild wood and prairie summer range was almost unlimited, and farmers could keep as many cattle as they could winter. Then some farmers were particularly adroit in stalling a large number of cattle on a small quantity of fodder—turning them out in the spring just alive and not on the list—"thin," as they expressed it, "yet in good heart." Even then, however, it soon grew into a maxim that a well wintered two year old exceeded in value a poorly wintered three year old. The breed of cattle, too, deteriorated under this economy. Now that the land is nearly all under fence, each farm must depend on its own resources, and it is not difficult to arrange matters so that the winter keep shall fully equal the summer in abundant supply for stock, with some to spare for village consumption.

To illustrate the value of grass as an important item in mixed husbandry, I will give the following facts:—A year ago I had a seven acre lot which, in ordinary course, was a fresh clover pasture. On apportioning my stock by estimate for the summer, I found this field extra, so I purchased some thrifty yearling cattle, which had been well wintered, partly Durham. I paid for them \$8 each. Seven of them I assigned to this lot, putting them in as soon as they could get a full bite. During the flush season of pasture I turned in four horses, but of these I will not take account. Most of the time the pasture was very abundant, all of the time sufficient. At the expiration of three and a half months the conclusion of harvest had furnished

abundant range for the young cattle elsewhere, the bite had become short, and the lot was laid by for late pasture for sheep. I then had the cattle valued by a competent judge, who said that they would sell quickly for \$13 each. From which it appears that the grass consumed by these young cattle occurred during the time, but rather a depression. The field was an highly elevated, sandy ridge—the cattle had water at will, and were duly salted twice each week. For this last, the pleasure of looking at them and seeing them grow, was sufficient compensation.

I may add that I have since wintered these cattle on hay and corn-stalks. This spring I sold one of them to the butcher for \$23; another is a cow, giving milk, worth \$25. The remainder worth from \$20 to \$25.

Milan, Erie Co., O.

"IT WON'T PAY."

AMONG the silliest of silly things, is the indiscriminate use of the expression, "It won't pay." Uttered with regard to some matters it is wise and proper, but relative to many others it is unwise and improper, if not wrong. Out in the busy walks of life, where men are constantly engrossed with the pursuit of money, and where experience has given a keen edge to the perceptive faculties, it is little wonder that the thousand and one foolish schemes that grow with such weedy growth in the brains of imaginative men, should receive a cold water extinguisher in the shape of the exclamation quoted. But, that beneficial institutions developed by age, by usefulness, by experience, and

by every means through which the value or usefulness of a thing can be demonstrated, should be set aside without an investigation of the principles upon which they are built, or the object which they are designed to and are attaining, by the use of such a foolish remark, seems unworthy of the name of a man of science.

No I thought on becoming acquainted with the following circumstances. A certain good farmer (?) having been asked to sell some corn, went to a dealer in potatoes to dispose of it. "What will you give," said he to the man of grain, "for one hundred bushels of corn?" "Well, don't know,"—the fact is don't care about buying much. Market's pretty full; things are looking gloomy on account of this war; guess times are going to be pretty hard, "spec corn's worth about seventy cents." "Can't you give no more than that for it?" "No sir," emphatically responded Grain, turning upon his heel, apparently indifferent concerning the event.—"Well, I guess you can have what little I've got," returned our Farmer.

This pretty little business transaction was duly "signed, sealed and delivered," and one of the parties made a large profit, and the other a large loss. Let us examine this transaction. To my certain knowledge this farmer "dropped" his paper because he wanted "every cent he could get," and it "wouldn't pay to continue it." Hence he did not know that periods of war excitement generally produce advanced prices in those things upon which war depends for its sustenance, (although followed by a corresponding depression at its close, if not before,) but he might have been posted in this respect if he had known what would pay, and have saved something besides, as the following portion of his experience will show.

A few days after the "sell," he met a neighbor, from whom he learned that a brother farmer had just been offered eighty cents a bushel, but concluded that it would be higher, and was going to "hold on." Last week he felt so "worked up" about it, that he borrowed a paper from another neighbor, and reading the "Markets," discovered that corn stood at ninety cents a bushel. What his ideas concerning the profitability of taking a good paper, (such as the one that he borrowed,) are, I know not; but, I think, myself, that in his case at least, going without one "won't pay." In the case of the dealer, it did pay to know what was going on in the world of trade and barter, and I heard nothing in saying that his paper is continued.

Thus much for an illustration drawn from actual life, concerning the working of this non-investigating, without information, penny-wise, pound-foolish, anti-progressive principle. It serves to give a true appreciation of the old adage, "Knowledge is Power." There were days when this might have been reversed, affording a reason why the desired end of both (success,) was not more readily attained. But the Present demands of him who would win, a steady step, side by side with every real improvement; a thorough study of the great world in which he lives, and a proper combination of Theory with Practice.

"A man who lives without any or with but little knowledge of what progress the world is making in the various phases of its manifested life, or who knows nothing (comparatively speaking,) of its daily experience, must not be astonished if his fellow-beings outstrip him in the march of time."

That Farmer who believes that it "Won't Pay" to take a good paper, and who depends upon others for that information which he should possess and reason upon himself, must not be surprised if he obtains such information at second hand; or, still more, if he ascertains the fact that "Knowledge is Power"—ful to make money.

W. E. S.

SOIL ANALYSIS,

AND THE CHANGABILITY OF THE HUMAN BODY.

Messrs. Editors:—The article in the RURAL of May 7th, entitled "A Peep into Modern Philosophy" is replete with good things, and I think your many readers feel obliged to the writer for attempting to expose some of the fallacies that obtain so readily in this wonderful latter part of the nineteenth century. After discussing pretty thoroughly the prevailing doctrines of Agricultural Chemistry and Vegetable Physiology, he asks—"Has there been one new idea established by soil analysis?" I will answer in the most decided manner,—Yes sir, thousands of them. The analysis of soils is one of the grandest achievements in Agricultural Science, and the experiments that have been made by LIEBIG, and other eminent Chemists, have opened a rich mine of agricultural knowledge, of which the world was entirely ignorant. It is well known that some soils are not congenial to certain crops, the only difficulty being a lack of some of the elements which enter into their composition, and in order to ascertain the deficiency the soil must be analyzed and the difficulty obviated by supplying the needed element, whether it be lime, sand, potash, bone dust or any other substance that can be easily applied to the soil. This has been done repeatedly, and by this process many farms have been made productive. Now, in order to raise any grain whatever, the elements of such grain must be in the ground. Hence the utility of soil analysis, and special manures.

All physiologists agree that the human body is renewed every seven years, or, in other words, that it evaporates or passes away by the sensible and insensible perspirations. The writer says that, "physiologically this may be true, but practically it is a stupid non-truth." But we think that he has failed to demonstrate the proposition. He says that the scars and other manifestations of the human body follow the man of 100 years to the grave. True, all persons preserve their form, complexion and identity, and some say that if the body is renewed every seven years, we should never grow old.

In the first place, change is the prevailing law of the Universe, and the human system is not an exception to this universal principle. The food that we eat supplies the natural waste of the body, but in order to sustain life, it must contain all the elements of which the body is composed, after passing into the stomach and undergoing certain changes, it is absorbed into the veins, and carried by the blood to all parts of the system and supplies the decay that is constantly going on in every part

of the human frame. As soon as a worn out particle is thrown off, its place is immediately filled by another through the agency of the blood, and thus the identity of the person is preserved. But the objector may say, if the old particles are replaced by new ones, how can we ever become infirm in body? I answer that the change takes place gradually, among the infinitely minute particles or atoms of matter, of which the human form divine is composed, and the new particles are corrupted by the remaining old ones, so that they in turn have to take their exit from the body. By taking a calm view into the philosophy of the thing, we cannot fail to see that it cannot be otherwise, for if it were not so, men would in a short time wear themselves out. How long would it take a man to wear out his hands in handling wood or stone? We frequently wear off the outside skin or cuticle, and it is as often renewed. It requires but sixteen weeks for the nails to grow from the roots to the ends of the fingers. The hair of the head, and the beard, when shaved off, are constantly reproduced.

I will conclude with an extract from one of our well known Philosophers:—"The decay and decomposition of animals and vegetables on the surface of the earth form the soil, which nourishes the growth of plants and other vegetables; and these in their turn, form the nutriment of animals. Thus is there a perpetual change from death to life, and from life to death, and as constant a succession in the forms and places which the particles of matter assume. Nothing is lost, and not a particle of matter is struck out of existence. The same matter of which every living animal and every vegetable was formed, before the flood, is still in existence. As nothing is lost, or annihilated, so it is probable that nothing has been added, and that we ourselves are composed of particles of matter as old as the creation."

N. B. AUSTIN.

"WHAT ARE WOLF TEETH IN HORSES?"

[The following article has been furnished us by R. JENNINGS, V. S., Professor of Anatomy in the Veterinary College, Philadelphia, Pa.]

In answer to your correspondent C. H. W., in the RURAL of May 14th, I would say that what are called wolf teeth in horses, (so named probably from their resemblance to the first molar teeth of the wolf,) are regarded by Veterinary Surgeons to be two small supernumerary teeth making their appearance on either side, immediately anterior of the first molar teeth of the upper jaw. The germs of these teeth will be found in the jaw of the developed foal, and are fully formed in the yearling, ready to work their way through the gums,—after which, as a general rule, they soon fall out; sometimes, however, they remain to an advanced period of life, during which time they undergo a change in form and resemble more closely the incisor teeth of man. Horsemen generally look upon these teeth as injurious to the eyes, but such is not the fact, as the experience of all Veterinary Surgeons will prove. What gave rise to such opinions I am unable to say; suppose such was the case, a majority of our horses would go blind, as all horses have these teeth at some period of their lives, most generally from the first to the fifth year.

If a horse has an attack of specific ophthalmia, these teeth are looked for (but at no other time) and if found, of course they are supposed to be the cause of the disease and are at once knocked out. This process bruises the gums, causing considerable inflammation in the parts, which, acting as a counter irritant, attracts the inflammation from the eye, the same as if a blister had been applied to some remote part, without disturbing these teeth. I have been practicing the veterinary profession a number of years and have yet to see a single case where these teeth have been in any way injurious.

In quoting "Every Man his Own Farrier," you have given publicity to some notions which are not founded upon the experience of the author or any one else, but are altogether imaginary. He says they appear "half an inch, or an inch from the grinders." Such is not the fact; they are situated in close proximity to the first molar on either side. I have my doubts if the author of that valuable work ever saw a wolf tooth, certainly not in the jaw. Again, he says—"These teeth are seldom found in young horses." Wrong again, for young horses are the very ones in which they are found. He says they are "supposed to affect the eyes and must be removed," and recommends the filing of them off even with the gums. If they are injurious how is this filing process to benefit the horse? The roots yet remain, and if the teeth are injurious at all it must be the roots that are so. Such authors do more harm than good by advancing false theories that have not a particle of evidence to sustain them. This filing process could not be accomplished, as the tooth would either pull out or break off in the effort to accomplish such an end. If you want the teeth removed take a common pair of dentists forceps and pull them out.

Rochester, May, 1889.

ABOUT THAT FOUR MINUTE CHURN.

Mr. Moore:—In your paper of April 2d, I noticed a hint from H. A. Cook, of Columbia Co., N. Y., relative to the "four-minute churn," and have seen some reference to it before. We know nothing of it in this region, but if it is what is claimed for it, we want it here. We have had many churns with equal pretensions to the one above named, most of which have proved humbugs, rather than churns. Now, if this is a new humbug, we would like to have it remain among the rocks and scrub-oaks of Columbia Co., where, in youthful days, we used to hunt rabbits. But, in order to test its real merits, I will offer a premium of ten dollars, (to be awarded under the direction of a Committee appointed by the Kalamazoo County Ag. Society for that purpose,) for a churn that will answer the following description, viz:—1st. It must be so simple in its construction, and so convenient that it will be adapted to general use. 2d. It must be durable, and so cheap as to bring it within the reach of all who wish to use it. 3d. It must make from new milk as much butter, and of as good quality, as can be made from the cream of the same milk, and do it with as little labor as would be required to make it with the old-fashioned dash churn.

Kalamazoo, Mich., 1889.

M. HAYMEYER.

JACKSON'S IMPROVEMENTS ON MOWERS AND REAPERS.

For Description, Price, &c., of Improvements above illustrated—intended to reduce Side Draft and lessen Whole Draft of Mowers and Reapers—see advertisement of S. E. & M. P. JACKSON.

TO THE OLD HEADS.

We do not mean, Mr. Moore, to use this term, "old heads," irreverently. To do ourselves justice it is proper to say we have been brought up to treat our elders with respect. We are in the habit of addressing men by their titles, as Col., Capt., Squire, Dr., &c. Others who have not these appellations, we address by the general term of Uncle, this being as courteous as any of which we can think. As a matter of course our relatives are numerous. But to the old heads.

Are you putting your sons forward? If not, we must take you to task. Do you do all the running to the store, the mill, &c.? When you ride out, do you hold the lines yourself, or put them into the hands of the son who rides by your side? The most successful farmer I know of here invariably lets his boys drive. He charges them with business as much as he can. As a consequence his boys are smart and ambitious, and are a help and a blessing to him. I saw him ride by to-day with his youngest son occupying this post of honor. The King of Heaven places his Son upon the right hand of his throne. Our Saviour said, "I and my Father are one." It has always been clear to me why celebrated men do not generally have distinguished sons. The presence of the parent overshadowed them so completely that they had no chance for self-reliance, independent development. It is often the case that we see men upwards of thirty, who, to all intents and purposes, as far as business is concerned, are boys still. They do not speak like men, understand like men, or act like men in any sense of the word. Now, the fault, to my knowledge, is not in "their stars or themselves, but in their father's that they are underlings." We have known farmers to introduce the parson or other visitors to their horses, cattle and sheep, while their children were kept entirely in the background. Can their be anything more chilling and denuding to the growth of manly feeling than such treatment?

We beg of you then, fathers, who have families growing up, to give them a little sunshine. Permit your sons now and then to put in a word edge-wise when visitors come. Trust them to buy and sell, to pay out and receive money. Suppose they make mistakes now and then; if you deal with honest men, they can be rectified. When you are passing down the declivities of this life, have a care that your sons are pressing up. Let it not be when the stranger or parson comes, "my cattle" or "my horses," but "my son, sir."

Cambridge Valley, N. Y., 1889.

H. K. F.

Rural Spirit of the Press.

Culture of Carrots.

It is not too late to try the following mode of cultivating the Carrot, as stated by an Illinois farmer in the *Prairie Farmer*:—"I have been very successful for the past two or three years in cultivating the Carrot. As a root for cattle and horses I prefer it to any other. It is very productive, yielding with us from five hundred to eight hundred bushels to the acre. The whole process of cultivating is very simple and cheap, not costing more than six cents per bushel. To grow them successfully requires a deep, rich soil, such as would produce the best corn. When the ground is in good order, say about the middle of May, plow deep and narrow, leaving twelve or fifteen inches of fine mellow soil. I prefer leaving it in beds or lands twelve feet wide. When plowed, if the land is quite dry, pass over it with a roller before planting. Plant in drills twenty inches apart. We use a line, mark with a hoe, cover half an inch deep, and press the soil by treading on the rows. The use of a seed drill would be much quicker, and probably better. With a hoe and line, two men will plant about an acre a day. Sow thick enough to insure a plant or two every inch. If all has been done well thus far, the young plants will make their appearance long before any weeds. As soon as the plants get large enough to show well, or before any weeds start, pass between the rows, hoeing the ground over lightly. Let them remain a week or two longer, and pass up and down the rows with a narrow hoe striking out the plants, leaving the hills from four to six inches apart. A few days after the hoe thinning, and after a second hoeing of the spaces, probably the plants will be large enough to thin by hand. This is the most tedious part of the work, and will require some patience, but I think four or five men will thin an acre a day. One plant is all that should be left in a hill. After thinning, hoe frequently, as it is much easier to prevent weeds than to kill them.—If the fall is favorable, the roots will grow one-half after the middle of September, therefore the need of keeping them clean all through the season.

"Hoeing."—This is a short job and may be done quite late. Take a sharp hoe, or what is better, a long Dutch shovel, commence next the deep furrow, shaving the tops from the first row into it, passing directly around the land. Follow with a plow, turning the soil from the roots on the tops which have been cut; now put the plow in deep and pass round the land again, turning the roots

bottom up, draw them on one side with a potato-hook or hoe, plow two more furrows round and shave the tops off the next row, then plow the roots out and proceed as before. Two men and a team will plow them out as fast as two men and another team can haul them away. The seed we use is of the common yellow sort, never having tried the large white. The whole secret of success depends on having the land in first-rate order, and starting the plants without any weeds."

Hay Caps—Use and How Made.

A writer in the *Country Gent.* strongly advises the use of hay caps, and says:—"In July, 1885, I had ten tons of hay cut on four acres, by Mowing Machines. It was put up, and the second day covered with 200 covers. I weighed several of the cocks and they averaged 100 pounds. It rained nearly two days, and the quantity of water was two inches and four-tenths. On the third day at 10 o'clock, I began to take it in, only the bottom being a little wet. This saved me one day opening and spreading, and in my opinion saved one-third of the value of the hay. My caps to cover a ton, cost \$5, and the hay sold for \$12 a ton, and this saving was from three days' use of the hay caps.—How much hay is injured by being wet is a matter we cannot speak of with entire certainty, but I had rather keep even the dew off of mine."

An exchange says the manner of making hay caps is as follows:—Purchase a piece of brown cotton, a yard and a quarter or half wide, stretch it in pleasant weather along a board fence, and apply a coat of linseed oil, with a paint brush, mixed with about one-quarter its bulk of spirits of turpentine, well stirred in while both are warm. Let the cloth hang till dry, and it will be ready for use.

Another, and perhaps a better way, is to mix two pounds of beeswax, a quart of Japan varnish, and a gallon of linseed oil together. Then apply with a brush while moderately warm. When the cloth is dry out it into squares, then have an eyelet hole worked in each corner, to admit small wooden pins, which are to be used to fasten the caps to the hay. Some people sow up small stones in bags, and attach them to the corners of the caps, which keep them in position by their weight. These weights would be much handier if attached to strong wire hooks and kept separate from the caps, and hung on as the caps are used. But cast-iron weights, with hooks attached, would be still better, if painted to prevent rusting.

Not too Late to Plant Corn.

The June number of the *Am. Agriculturist* has these timely suggestions:—"It is by no means too late to plant corn during the first week in June. Some good farmers purposely delay their principal corn planting until the last of May or first of June. Their experience has taught them that, as a general rule, corn planted June 1st is as forward by the end of July, as that planted May 10th. They say, that when planted late, the ground is warm and quickly germinates the seed, and starts it at once into vigorous growth, and that it will soon overtake and go ahead of the early planted. They also argue that one hoeing is saved by the late working of the soil previous to planting, as a large number of weeds which have started, are then killed. This year it is safe to act upon this theory, where there is a spare plot that may be used. The quick growing varieties, like the King Philip, are most desirable for late planting, and for filling up vacant spots in that already above the ground. Of course, it will not do to mix in the different varieties where pure seed is to be gathered."

Mowing Machines, &c.

"ESSEX" writes to the *N. E. Farmer* in this wise:—"I am frequently asked what kind of Mowing Machine had I better obtain for the cutting of the grass on a farm of about one hundred acres—fifteen of which are upland mowing? A Mower moved by one horse should be sufficient for such a farm; though if two or more adjoining farmers could unite in purchasing a machine to be moved by two horses, the work would be better done. The best way you can fix it, it requires power, and considerable of it, to carry through a sward three and a half or four feet wide, where there is a burden of grass of two tons to the acre; and no enterprising farmer should remain satisfied with a crop less than this, on land of fair quality. I know that the average product, throughout the State, is less than one ton to the acre; but this does not prove that it ought not to be two tons; it only proves that the present state of culture is far below what it ought to be. So many have practiced skinning their land, by running the plow only four or five inches deep, and scrimping it by dealing out their manure with a small shovel—that the small crop mentioned is the consequence."

Fall Plowing for Roots.

JOHN HOWARD, of Kentucky, says that in Great Britain, the plowing of land in the fall, that it may thus be exposed to the action of the frosts and of the atmosphere, is considered as good as seven tons of additional manure in the growth of turnip and carrot crops. If that be so in the old country, it must be much more so here, where the winter is longer and the frosts are more severe and penetrate more deeply into the soil.—E.

Agricultural Miscellany.

THE CROP PROSPECTS continue favorable in this region. Our information is that wheat appears unusually promising, while other crops are progressing finely, with the prospect of an abundant yield. The heavy rains and cool weather of the past week have proved favorable for grass, which is reported light. The "chill" has of course checked the growth of corn, but caused no material injury. Reports from the West, and other sections, continue favorable, though adverse accounts reach us from some localities.

GIVE THE PRICES.—As we have hitherto suggested, if advertisers would give the prices of lands, implements, &c., offered for sale, it would save the time and trouble of writing many letters, and thus greatly facilitate trade. We are in frequent receipt of letters inquiring the price of articles advertised in the RURAL, and are often unable to answer; such inquiries should always be addressed to the advertisers. The best way is for advertisers to state prices whenever practicable.

HOW TO GET PATENT REPORTS, &c.—A correspondent wishes to know how he can procure the Patent Office Reports and the Transactions of our State Ag. Society. The best way to obtain the former is to apply to the M. C. of his District, (or to some aspiring M. C. or office-holder at Washington.) As to the Transactions, our members of the Legislature are usually pretty well supplied with the volumes issued during their term. We cannot say where back sets of either Patent Reports or Transactions can be purchased, though they are occasionally obtainable at \$1 per volume.

HIGH PRICES FOR HORSES.—Rochester and Monroe County have long been celebrated for producing superior horses. Many fine specimens of the equine race are annually sold here, for fancy and "fast" service in New York city and elsewhere. Within a few days three Monroe Co. horses have been sold, separately, (as single horses,) at high figures. One of these was sold by MORGAN L. KING, formerly of this county, but now of New York, for \$1,800; one by Hon. E. B. HOLMES, of Brockport, for \$1,000, and another by A. D. BARNHART, of this city, at the same price. Of course each of these horses combined style and speed in an eminent degree.

DRAINAGE IN FRANCE.—Within a year past considerable tracts of land have been systematically drained in the vicinity of Paris. In the Arrondissement of Corbeil, for instance, \$88,000 have been expended in drainage. The total amount of land drained in the Department of Seine-et-Oise is 5,000 acres by 234 land-holders, at an average cost of \$27 per acre. The product of this land has been increased by \$3 an acre. The yield of wheat has been augmented from 19 to 26 bushels per acre, and of oats from 23 to 40. A writer expresses the hope that before many years draining and irrigation may be carried to such an extent as to free France, in a great degree, from the ruinous inundations to which many portions of the country are now subject.

MICHIGAN STATE AG. SOCIETY.—The next Fair of this Society is to be held at Detroit, Oct. 4th to 9th inclusive. The premiums offered in the various classes of Live Stock are quite liberal, and the rules and regulations comprise proper explanations and restrictions—the whole having been thoroughly revised by the present Executive Committee. Among other new features we observe that no animal is barred from competition on account of having taken a first premium at any previous Fair, and that two new classes have been added in the Horse Department—one "Black Horses and Morgans," and the other "Horses Early Thoroughbred." So far as we have examined it we consider the list a decided improvement upon its predecessors. The premiums are open to competitors from any part of the World.

THE SOUTHERN CULTIVATOR.—The June number of this leading Agricultural Journal of the South, contains the valedictory of Dr. DANIEL LEE, formerly of this city, who has been one of its editors for several years. The Dr. says the *Cultivator* has "so many warm friends and contributors that it can well spare the aid of any [his] editorial pen"—and the proprietor adds, "we can confidently promise a more practical and progressive Agricultural monthly than we have heretofore furnished." We are inclined to subscribe to the truthfulness of both these statements, though the latter is not especially complimentary to our retiring friend, the Doctor. Dr. REDMOND, Esq., who has been the principal conductor of the *Cultivator* for some years, becomes sole editor, under whose control we have no doubt its high reputation will be fully maintained. Published at Augusta, Ga., by WM. S. JONES, at \$1 per annum.

MARKET FAIRS.—At a meeting of the Mass. Board of Agriculture, some time ago, it was "Voted," that this Board recognizes the great importance of establishing frequent Markets or Fairs for the Sale of Agricultural Products." Also, "That the subject be brought before the County Ag. Societies, with the request that they will take early steps for the establishment of Markets within their respective districts." Since this action Market Fairs have been held in several districts, and resulted quite satisfactorily, so far as we can judge from the reports published. Speaking of the Market Fair at No. Andover (9th ult.), a writer in the *N. E. Farmer* says—"The gathering was large, the animals presented of superior character, and trading brisk and satisfactory. So well satisfied were the Trustees that they determined to hold another at Georgetown, June 31st. I was pleased to see on the ground a mowing, to be moved by one horse; and wheels for guiding the plow without hands; and corn cultivators, said to do the useful, without disturbing the roots of the plants. I have entire confidence that market fairs are to be one of our 'Yankee Notions.'"

WOOL GROWING IN CALIFORNIA.—The climate and pasture of California are well adapted to wool growing, and a large area of the State can be most profitably employed in that direction. Considerable attention is being given to the business. An instance is mentioned of a gentleman who five years ago bought 500 ewes for \$7,500—from which investment he has sold sheep and wool to the amount of over \$70,000, and now has a flock worth over \$40,000. A late issue of the *San Francisco Price Current*, in an article speaking of the pioneer sheep ranch of Monterey county—the San Justo, owned by Messrs. FLINT, BIXBY & Co.—says:—"On this ranch there are now 24,000 sheep, young and old, of which about 2,000 are pure Merino. This season one flock of 1,900 ewes have produced 2,900 lambs. Another of 1,100 ewes, 1,400 lambs. All the lambs are from one-fourth to three-fourths Merino. The original stock were driven to California across the plains, and of course are superior to the Mexican sheep. The wool grown at San Justo last year, amounting (returns received by last lbs.), was lately sold in Boston (returns received by last mail), at an average of 80c per lb., which is equivalent to 45c. for the same quality of washed wool. Under constant efforts to improve stock, the wool will grow better each year."

MONROE CO. HORSE SHOW.—The complete Premium List, Regulations, &c., for this exhibition will be found on our seventh page.

HORTICULTURAL

THE TULIP.

For more than a century the Tulip has been a great favorite with the lovers of flowers. Nothing in the floral world can exceed the beauty and brilliancy of a bed of fine Tulips; and yet, travel over the country, through city, and village, and farming district, and with the exception of the nurseries and the gardens of professional florists, scarcely a respectable bed of Tulips is to be found. The cause of this neglect is partly attributable to the idea so prevalent, and encouraged by most writers, that a great deal of care and skill is necessary to grow a Tulip—that the natural soil must be removed for several feet and substituted by one prepared with the greatest nicety. This, we wish to say, is not at all necessary. Tulips may be grown in any good, rich, garden soil. It should be well drained, and if a little sandy all the better; if inclined to clay, add a little sandy loam, and if poor, add rotted turf, or soil from an old pasture, with any thoroughly rotted manure. There is no difficulty, and need be no mystery, about the culture of the Tulip.

The time for planting is in October. Make the bed prepared for them fine and mellow, and plant the bulbs in rows from six to eight inches apart each way. Unless the ground is quite light, it is well to surround the bulb with sand at the time of planting. This is for beds entirely devoted to the Tulip, but they look well if placed in the border or on the lawn, half a dozen or more in a cluster. Bulbs can be obtained from the nurseries and seedsmen at prices varying from one dollar to three dollars per dozen.

In Europe, where this flower is so highly prized and generally cultivated, and where they have a Great National Tulip Show, and Tulip Societies, the "properties" or "points" of a good Tulip are well understood, and of course govern the judges in making their decisions. A few of these we will give.

1. The Cup should form when quite expanded, from half to a third of a hollow ball. [This half is shown in engraving.] To do this the petals must be six in number, broad at the ends, smooth at the edges and the divisions between the petals scarcely to show an indentation.
2. The three inner petals should be set close to the three outer ones and the whole be broad enough to allow of the fullest expansion without quivering, that is, exhibiting an opening between the petals.
3. The petals should be thick, smooth and stiff, so as to keep their form well.
4. The ground should be clear and distinct, whether white or yellow.
5. All the six petals must be marked alike.
6. The color must be dense and decided, distinct in its outline, not shaded or flushed.
7. The height should be about thirty inches; for two fields of the bed not less than 30 inches, and the outside eighteen or twenty.

The Tulips are divided into two general classes, *Early* and *Late*, and these again into several others. The *Early Tulips* flower in this latitude about the first of May. The *Duc Van Thol*, single and double, are very pretty and showy, growing on short stems, about four inches in height. There is a single and double variety. *Tournefort* is another early variety or class, with showy flowers, orange and red. These are the only sorts suitable for forcing in glasses, or in pots in the house.

Of the *Late Tulips* there are many varieties, the distinctions between each more or less clearly defined, though even among the best florists there seems to be some confusion. We describe the principal classes.

A *Self* or *Plain* is either white or yellow. Breeders are those of any other than the above two colors, and of only one color.

Bizarres have yellow ground, broken and marked with any other color.

Ribbons have white ground, marked with purple or violet.

The *Rose* has white ground, marked or variegated with rose, scarlet, crimson or cherry color.

The *Doreen* make a little different classification; and in addition to *Ribbons* and *Bizarres*, have *Prime Baguettes*, very tall, with fine cups and white bottoms, well variegated with brown. *Rigante Baguette*, not so tall as the last, but with thicker stems, and large, well-formed cups; white bottoms, variegated with brown.

Incomparable Verpoete—cups very perfect, cherry and rose with white bottoms, well variegated with shining brown.

In addition to these, we have the *Purpore*, the edges of the petals being fringed, colors crimson and yellow, marked with bright green; and *altior* these are not much esteemed by florists, who are very arbitrary in their notions, we say with confidence that those who plant *Purpore* will be delighted with their beauty in the flowering season.

The *Double Tulips*, too, are of every shade of color—brilliant red, and double as the peony, yellow as gold, and of every shade of color. Of late years the Double Tulips have been much improved, and deserve a place in every good collection.

GENESEE VALLEY HORTICULTURAL SOCIETY.

This Society gave its first exhibition at Corinthian Hall, in this city, May 20th. It was a little too late for the *Hyacinths*, but the Tulips were in perfection, and this was the grand feature of the show. The best display was made by ELLWANGER & BERRY, and the exhibition of A. FROST & CO. was also that of WM. KING. Not a single collection was made by an amateur, although the premium list called for *specimens*, and we therefore conclude that no amateur could show twelve good specimens, which is a rather humiliating fact. The President, SELAH MATTHEWS, exhibited some of the best Tulips and grapes, which drew a great commendation. The next exhibition for *Strawberries*, *Cherries*, &c., is to be held on the 24th of June.

PERFECT TULIP.

GARDENING.

Men and women, whose occupations confine them for the most part within doors, if so fortunately situated as to have the use of a garden, deprive themselves of a rich source of physical and mental profit by hiring their gardens planted and tended. Country mechanics and professional men, and residents of villages and the suburbs of cities, whose work is generally in the shop, mill, office or study, are seldom without a piece of ground devoted to gardening purposes attached to their dwellings, but, too often, the only use the occupants of these little estates derive from their possession is the privilege of eating the fruits and vegetables raised in them by hired labor. But the whole use of a garden does not lie in consuming its products; there is as much benefit, though of a different kind, in raising melons, squashes, cabbages, strawberries, &c., as in eating them, and, but for the advantages of freshness and economy, one might as well obtain his garden fruits at the market as gather them from a piece of ground on which they have grown with no more and from him than have the blackberries in the woods.

Perhaps the greatest advantage the in-door laborer derives from gardening, consists in its affording him a means of taking exercise in the open air, with an object. Long, errandless walks, undertaken at stated times of day, not from a love of walking but for the sake of health, and the various manoeuvres of ball, cricket and other games, performed not always because the actor feels in playful mood, but because he must do something for his health, and other like expedients for the maintenance or restoration of physical vigor, generally fall short of the happy results expected from them. The pursuit of health, like the pursuit of happiness, is attended with the best success when the pursuit forgets what he is after and turns aside in search of other objects. The instinct of animals is a useful guide on this point. Delighting in the open air, (they are sometimes allowed a hurtful excess of it,) they take little exercise, except for the purpose of satisfying their wants. Imagine a flock of sheep promenading the pasture by the hour for exercise! birds flying for exercise! fish swimming for exercise! They are too sensible for that.

Even if the beginner resorts to gardening as a medicine, and takes it up, at first, in a reluctant, mechanical way, the charms of this pursuit are sure to win upon him that what was commenced as a duty will soon be continued as a pleasure. The immediate and visible effect of his labors in beautifying his ground and bringing forward the objects of his care, so satisfy his mind and stimulate him to renewed exertion, that it is not long before, on entering his garden for an hour's work, he ceases to remember that he has any other errand there than to assist the development of the various forms of vegetable life it contains.

The garden also affords a most suitable and profitable outlet for the nervous irritation which long-continued labor in doors, and especially brain-work, engenders, and which is far more easily worked off than walked off. The longing to escape from the depressing influences of confinement to the house, and to shake off the fret and worry brought on by disturbing events or by the perplexities of business or study, often amounts to a fever of impatience before the day's work is finished. The hoe is an excellent conductor of this fever-fluid, and noxious weeds are perfectly legitimate objects to spend its wrath on. Muscular exercise in the open air, directed towards one interesting object, by drawing the mind from the subjects of its late vexation, soon restore it to equanimity and repose. Persons who have felt the happy effect of an hour's brisk work in the garden, in quieting nervous excitement, will recognize the mistake made by CHARLOTTE BRONTE's father, who, when annoyed, was accustomed to vent his displeasure, and thus tranquilize himself, by some disagreeable or mischievous act, such as firing off pistols, or destroying his wife's silk dresses and his children's fancy shoes.

Men, whose cultivation of the earth is limited to a garden, must, of course, divide the care of it with the other members of their family, but the garden belonging to a farm-house may, properly enough, so far as they are able to attend to it, be given up to the management of the wife and children of the owner. But, unfortunately, the feminine portion of farmers' families can generally spare less time from household duties to devote to out-door work than the wives and daughters of other classes of laborers. The cause of this is to be found in the fact that farmers are generally anxious to possess more land than they are able to cultivate with their own hands and the help of their sons, and from considerations of economy, or because it is the custom, or for some other reason, adopt that pernicious system of employing help which, from April till December, turns their dwellings into boarding-houses, the boarders being partly permanent and partly transient, in proportion as the exigencies of farm work require the

aid of season-hands and day-laborers. It sometimes happens that the convenience of a family is promoted by receiving a help as an inmate, but that relation of employer and employed, which requires one man's wife to cook for half a dozen other women's husbands, has no foundation of propriety, and ought to be broken up.

The great advantage of gardening, for persons who have but a small portion of each day to devote to out-door labor, is that, from the beginning, the work may be done by littles. Spring weather is so variable, and seeds differ so much in their dependence on the warmth of earth and air to help their growth, that the season of planting a garden may be extended through several weeks. A like succession is practicable, and even necessary, in hoeing and weeding it. Spending one day out of a fortnight or a month in doing the garden, hoeing potatoes, corn, beans, cabbages, and whatever else can be crowded in, is but an awkward, clumsy method of caring for the different varieties of plants of which a good garden collection consists, and which are as unlike in their wants and in the frequency of the attention they require, as they are in the habits of growth. The more tender, delicate plants are sure to suffer severely from such careless treatment, the notion prevailing that strawberries and such fancy fruits are of secondary importance—vigorous, coarse-growing vegetables, which might successfully contend with weeds for the nourishment in the soil, are likely to receive the first attention; usually but little, and frequently no time remaining to bestow on things that stand in greater need of cultivation. As might be expected, when the time comes at which the delicate fruits and finer vegetables should be ready for the table, they are *non est*; and the owner of the ground, probably quite unconscious of his neglect, begins to doubt whether such things are really worth cultivating, and finally, after allowing them to drag out a half-starved existence for two or three years, banishes them from the garden. South Livonia, N. Y., 1859. A.

THE NEW GRAPE.

BRELOVED RURAL:—At the close of several articles on *New Grapes*, which appeared in your issue of the 26th of March—among them one from me—you remark that, "If one-half that is said of the new seedling grapes is true," &c., and add, "Be a little careful of your descriptions, gentlemen—don't spread it on too thick."

Being engaged in originating new fruits, flowers, &c., making the hardy native grape a specialty, and supposing it to be a matter of public interest, provided I had produced something new and valuable—sent for publication in the *Rural* the articles referred to, intending to continue, after describing the parent grape, a description of such of my new grapes as I thought worthy of notice.

The description I gave of the *Franklin*, is as follows:—"The bunches are of medium size, black, with a blue bloom; berries round, about half an inch in diameter, ripening about the first of September. * * * I have always esteemed it a good grape, all things considered, but do not profess to be a connoisseur in such matters." I also gave the opinion of J. B. GARBER, Esq., of this grape, and added, "The vine and fruit closely resembles the *Clinton*, bunches more compact, berries much sweeter."

And this is what the Editor of the *Rural* calls "spreading it on too thick," and professes to believe that, if "one-half" is "true" "we shall have the most delicious fruit the world ever saw or tasted."

"On Syntac's tap there is a cap,
And in that cap there is a drop."

The point contained in the remarks of the Editor are as mysterious to me as the riddle of "Syntac's"—a Gordian knot which I cannot untie—none but the "Editor" can do it. Will he try?

The *Franklin* grape was noticed first of March in the *Gardeners' Monthly*, by a competent and disinterested person, to whom I had sent a vine on the 7th of May, 1856, and which he had in bearing in 1858. The Editor of a leading Horticultural Journal should not have been ignorant of this, especially at a time when the "New Grape" mania is at full tide.

I have propagated, sold and given away vines of the *Franklin* for several years, charging twenty-five cents each when sold. They were advertised at that rate in the *Rural*. If selling valuable grape vines at twenty-five cents, or giving them away, constitutes the "spreading it on too thick," whilst at the same time I sold inferior varieties at selling at from one to five dollars each, and "ten dollars per vine" on "subscription," (not then I am a stranger to a proper sense of propriety, and will yield implicit obedience to the suggestions offered—otherwise not.

No, dear *Rural*, I am not "in the market," tho' my grape vines are, at twenty-five cents! No grapes are offered on "subscription" by me,—no five nor ten dollar grapes have, nor ever will, originate in my grounds; and though they should excel

Hamburgh, Muscat, or Chasselas, and prove to be "the most delicious fruit the world ever saw or tasted," they get no reputation from me.

If my new grapes are worthy, they must get a reputation from those who are capable, worthy of confidence, and as much strangers to me as is Editor of the *Rural*. The patrons of the *Rural* will render judgment. O. T. HOMAS.
Randolph, Craw. Co., Pa., May, 1859.

REMARKS.—The above seems to need a word from us. The remarks we made, and which our correspondent has quoted several times, were, as he very truly says, made "at the close of several articles which appeared March 26th, among them one from me." (O. T. HOMAS.) Now, our correspondent is so unfair as to take these remarks made in reference to "several articles," apply them all to his own communication, and then quotes from his own article only, to show that they were uncalled for, and pretends to be wonderfully exercised to know what they mean, and why they were made. There are none so blind as those who will not see.

We did see the description of the *Franklin* grape, in the *Gardeners' Monthly* and of the *Ontario* in the *Horticulturist*, and we have lately read many descriptions of new grapes, and it was this that induced us to give a few words of caution to those who describe as well as those who invest their money in new varieties. "The present excitement for new hardy grapes—the epidemic or grape fever," (to use the words of Mr. GARBER), the interests of our readers, and of truth, demanded this, and we have performed our duty.

CURLED LEAF IN THE PEACH.

MESSRS. EDS.:—I noticed an inquiry in the *Rural* some time last summer asking for information respecting the disease in peach trees, commonly called the *Curled Leaf*. I have not the paper by me just now, but you said that it was by some supposed to be caused by an insect, but you had never been able to discover any which appeared to cause it. I now send you a few specimens of the curlier. They are rather scarce on my trees this year, but I have frequently seen the underside of the leaf literally covered with them, and as soon as the leaf begins to curl and get red or brown, the insect is gone. I have observed their ravages for several years, and can always find the insect if I look in time, but almost every person that I have spoken to on the subject lay it to some other cause, from the fact that they have never been able to see anything of the kind. They never examine, however, until the leaves begin to curl and drop off, and then it is too late—the bird has flown.

I would just say that the curlier leaves are attacked in the same manner here by similar beings, the leaves also curl and get red, but the insect is easier discovered on them than on the peach. If this leads you to examine in time and discover them on the trees, my object in this scratch will be gained. My trees stand on high sandy soil. St. Catharines, C. W., 1859. MOSES COOK.

REMARKS.—These insects we have often seen on both currant and peach leaves, and on the former they cause the redish blotches so often seen. We have long thought that the curl was caused by cold, wet weather in the spring when the leaves were young and tender, as it is not seen during fine mild weather, but after a cold storm almost every leaf will fall from the trees. Still, we are thankful for the hint. Close investigation is what we need in horticulture.

SWEET POTATOES.—I have a garden of warm sandy soil in which I purpose to try the experiment of raising sweet potatoes. Not being acquainted with the *modus operandi*, please furnish such information as is necessary to secure success. In doing so you will not only confer a favor on the subscriber, but hundreds of others who read your useful paper. At harvest time, if nothing prevails, will report my success.—WADSWORTH CLARK, Gasport, Niagara Co., N. Y., 1859.

SWEET POTATOES in this climate, must be started in a hot-bed. Several persons in different parts of the country make quite a business of raising young plants to dispose of. One or more of these have advertised in the *Rural* the present spring. The price being only from \$1.50 to \$2.00 per thousand, those wishing only a few hundred plants had better procure them in this way. From the first to the middle of June is the time for planting. Set in hills, about three feet apart, in pretty high hills, one plant to the hill. Another plan is to plow the ground up in ridges, setting a row of plants on the highest part of each ridge, so that the plants will be from three feet to three-and-a-half feet each way. Cultivate enough to keep the weeds destroyed, the soil mellow, and the vines from taking root at each joint, which they are very apt to do, unless well cared for. This will destroy the crop, and give you a mass of worthless, small potatoes. A correspondent in Ohio sends us the following on the subject:

SWEET POTATOES.—I have tried, during the last five years, three different methods of raising this delicious vegetable, which, by the way, I believe can be had in perfection in many parts of our Northern States, where the people who have never made the trial, would as soon think they could raise oranges.

The first of these methods is, I suppose, the common one, viz., to obtain slips, as they are pulled from the unlifted seed potato in the hot-bed, and plant them out in high ridges, or hills, about the time of planting corn. I have in this way, in rich, well-worked ground, obtained every year for the last four, what I have regarded as amply remunerative for the care and labor bestowed.

The second method is to take off the slips two or three weeks earlier, and plant them in another hot-bed or cold frame, that they may become well rooted and strong. I this year had very fine plants in this way, with abundance of roots, ready to go right along with a vigorous growth as soon as put into the open ground. But mark the result,—a great number of small potatoes.

The third method, which, judging from the experience of a single year, the present, is by far the best of all, is to raise your own plants at home, in your own hot-bed, and be ready as soon as they are large enough, and the danger of frost is over, and there is a fair prospect of a shower at hand, to take up the seed potato from its bed, and cut out a little of the old potato with each shoot, so as not to injure the fibrous roots, and immediately plant out in the prepared hills. Of course you will not get half as many plants from the same quantity of seed in this way, as by the other method of taking off slips, and leaving the old potato to send up a new crop. But if the object is to get fine, large, and early ripened potatoes, rather than plants, I feel confident that great advantage will be found in the method proposed. At least such has been my experience this year—the crop raised in this way the present season being the largest and finest I have ever seen. Will some others take note of this, and try the same thing next year, and communicate the result?

SALERATUS.

Or late some of the doctors, and others who think they have more light on the subject of dietetics than their neighbors, have commenced a crusade against the use of saleratus in making articles of human food. They seem to have one poet, at least, in their ranks, and here is the first effusion that has met our eye:

None can make a shortened cake
So good as could my mother,
And I think I know why 'tis so
As well as any other.
Because, since then, some wicked men,
With a kind of apparatus,
Have made a stuff the bread to put,
And called it saleratus.

Don't ask us why so many die—
That some should live's surprising—
Since now our food is made of wood,
And salt is used for rising.
I hope the cooks (with their good looks)
Will not exterminate us
With cake and pig mixed up with lie,
Reduced to saleratus.

May every pot in which they've got
The stuff, be burst to atoms;
May everything in which it's been
Be minus top and bottom.
May every store on sea and shore,
(What else could more elate us?)
By fire or flood, or to the mud,
Leave all the saleratus.

And now ye fair, I little care
What else may be the diet,
Though made of rye, and hard and dry,
The big brown loaf, I'll try it.
With cabbage "bled" and turnip piled,
You're welcome to come at us—
Yes, anything but poisoning
With puffing saleratus.

USEFUL RECIPES.

Mrs. MOORE:—I am neither the *Wife of a Farmer* nor a *Farmer's Daughter*, but will not yield the palm to any in cooking a dinner, and send a few recipes which I trust will be acceptable to my sister readers of the *Rural*:

VEGETABLE OYSTERS.—Put one quart of sliced oysters in two quarts of water, cook till very tender, then add salt, pepper and butter, and a half pint of sweet cream. Serve with crackers.

CHICKEN PIE.—Boil the chicken in water sufficient to make a good dressing, till the meat will easily slip from the bones—the latter to be all removed. Mix the meat well together, season with salt, butter, and a little flour. Make a crust in the usual manner, line dishes two or three inches in depth with crust, put in the meat with plenty of gravy, and bake in a moderate oven. This is a great improvement upon putting in the bones, as it does away with a choice in the parts.

BUTTER CRACKERS.—Four eggs, one cup of sour cream, a lump of butter the bigness of an egg, flour sufficient to knead good. Pound ten minutes.

EXTRA GINGER SNAPS.—Four teaspoonfuls water, six of butter, one of soda, one of ginger. Put in a teacup and fill up with molasses.

WINDOW SHADES.—Will some one who knows, give the readers of the *Rural* a recipe for making transparent window shutters. N. C. M.
Home Vale, Liv. Co., N. Y., May, 1859.

CORN MEAL PUDDING, INQUIRIES, &c.

MESSRS. EDS.:—Where has the "Domestic" department of your valuable paper hidden itself? Have not the ladies ambition and intelligence enough to sustain one column? I, for one, hope it will revive with the vernal showers, and will add my mite.

FLOATING ISLANDS.—Extra.—Five eggs, whites and yolks beaten separately, add to the yolks 1½ pints good sweet milk, a small sized cup of sugar, nutmeg, or lemon, to the taste. Heat almost to boiling point, or till it begins to thicken, remove, dish, and spread the white froth over, and serve hot or cold.

CORN MEAL PUDDING.—Scald 1 quart sweet milk, while boiling stir in corn meal until it is of the consistency of paucane batter, remove from fire, add 4 eggs beaten together; 1 cup sugar; nutmeg; pour in a dish and bake moderately 2 hours—serve hot, with cream or wine sauce.

Will some of the sisters inform me how to color soiled white ribbon pink?—tan color, blue? and ashes of roses? Please be explicit as to quantity of material. Will some of the ladies please inform me how to make No. 1 Jumbles? Hopedale, Ohio, 1859. M. TAGGART.

HARD SOAP.—WARNING.—Having seen an inquiry in your valuable paper for a good recipe for making hard soap, I do not hesitate to send you the following:

Three patent pails of soft soap, five pints of salt; boil and stir well together, then cool; take off the top and add to it 1½ pails of very weak lye, 2½ pails of salt and ½ lb. of rosin. Boil and stir thoroughly as before; then cool and cut in bars to dry. The more times it is melted the whiter it will be.

I will also give the following recipe for washing, which we consider an excellent one.—Mix half gallon of water, one pound anal-soda, one gill spirits of turpentine, and let them heat slowly to a boil, then cool, stirring it frequently until it becomes hard. Soak your clothes over night, and to four or five pails of water, add one teaspoonful of the soap, boil them 20 or 25 minutes, and rinse in hot water.—E. L. M., Coxsenry, Chenango Co., N. Y., 1858.

* Our correspondent who thinks has forgotten the soap. It would be difficult to boil such a composition until it becomes hard.—Ed.

Will some *Rural* reader please give their method of washing white craps shawls, and oblige a sister of—DRAWDEN, Hartford, Wis., May, 1859.

Written for Moore's Rural New-Yorker.
THE DESERTED VILLAGE.

A VILLAGE deserted; how strangely still
Falls the chastened light on the untrod hill,
And muffled seems even the laugh of the rill,
As, gliding on,
It kisses the wheels of the motionless mill
With a sighing tone.

Echoes lie sleeping in every nook,
But wake at the sound of a human foot,
And fly to the meadow across the brook,
And hide away,
Till gone are the eyes that came to look
On beauty's decay.

The soft green moss has faintly thrown
Its velvet shawl o'er each paving stone,
And undisturbed has it ever grown;
For gone are the feet
That trod there once—the busy throng
Are all asleep.

And the homes that were once by love made bright,
Are dark and cold. Ah, no more the light,
And the holly bough of the festive night
Shall deck the walls;
For decay is there, and the mildew blight
Makes dim the halls.

The ivy climbs round the old church door,
Beats through the cracks to trail on the floor,
And seems half-conscious that never more
The Te Deum long
Shall roll through the aisles as in days of yore
From the low-bowed throng.

They say sometimes when the day grows dim,
And through each crevice the shades drift in,
That unseen hands sweep the organ grim,
Till the very breeze—
To list to the strange and holy hymn—
Hangs mute on the leaves.

Lonely and still, but the mist dim fold—
As it upward glides with a graceful roll,
And is turned, by the sunlight's kiss, to gold—
Reveals softly there,
O'er the ruined homes and gardens old,
Like a silent prayer.

Marshall, Mich., 1859. LENA.

THE HOOP DISCUSSION.

REALLY, ladies, I think this question has been quite thoroughly canvassed. No doubt it is a very important subject, but is it not rather inappropriate that so much of the space of a literary and family newspaper should be occupied in the discussion of how a lady shall wear her petticoats; and whether her skirt shall touch the floor, or be a foot or so above it? If any more light is needed upon this intricate matter, would it not be well to have all correspondence on this point issued in a separate circular? Any extra expense might be defrayed by a contribution among the reformers. The RURAL has many friends because it speaks with useful information—with food for mind and heart. Is it not detracting from the dignity of a paper occupying the position that the RURAL does, to have its columns taken up with what would better suit a "Woman's Rights" organ? My ideas may arise from prejudice that will wear away when the long-expected day shall arise, when the "reform dress" shall be installed into public favor,—at all events, I am sincere in these sentiments.

As to the present style being the cause of ill health, I have no doubt any other mode of dress can be made just as uncomfortable as the long skirts. Tight lacing is much more injurious than long skirts. Any woman so addicted to fashion that she will sacrifice her health to its requirements will manage to make herself uncomfortable in some way. Such a class of women need a reform of the heart and mind instead of the outer garment. As to those who are so anxious to display the beautiful forms hidden behind long dragging skirts, their condition is pitiable. I know not what can be done to alleviate their sorrows. I hope they may be blest with sufficient patience to wait the wished-for day, when these trailing robes shall be banished, and woman liberated from her thralldom. May the RURAL prosper, and may the "Ladies Olio" soon be better filled than with talk of Hoop Skirts.

AUNTIE TO THE BOYS.

BOYS, did any body ever pat you on the head, and say "You'll be a rich man before you die?" Did it please you very much? I presume it did.—You think it would be a fine thing to live in a large house, with a beautiful garden around it, and ride in a new carriage.

But there is danger in growing rich. I presume you think I mean the danger of taking dishonest ways of making money—cheating, stealing, forging and such; but I do not mean any of these.—There is danger that in becoming rich, you will also become selfish. You may be so engaged in making money, that you will forget to make yourselves noble men—forget to cultivate your minds—forget to govern your tempers—forget to polish your manners; and on the contrary, become as hard hearted as the copper cents you so much admire, and as dull and rusty as the oldest one you ever saw. Then do you suppose good people will respect you, just for your money? No, indeed. A gentlemanly, intelligent and generous man of wealth is respected, but one who has only his money to recommend him, is poor indeed.

The Bible says, "If riches increase, set not your hearts upon them." There is the secret. "set not your hearts upon them." Put your money to some good use, and then it will not rust your souls.—M.

Is everything that women write there will be thousands of faults against grammar, but also, to a certainty, always a charm never to be found in the letters of men.—Madame de Maintenon.

ENGLISH GIRLS.

English children must have abundance of fresh, out-door air every day, if possible; and an important part of the duty of the nurse-maid is to take the children out several hours every fine day, including the infant. One of the most beautiful pictures in the London parks, and, indeed, everywhere all over England, is the innumerable nurse-maids, themselves radiant with health, with their still more radiant children. Thus the English girl is early trained to a habit and love of walking that she never loses, and in this way secures round limbs, and expanded chest, and ruddy countenance while still a child. It is hardly necessary to say that the shoes of English children have thick soles, and that their clothing throughout is very carefully adapted to the season and the weather.

I am afraid that American mothers will laugh when I say the mothers of England are very particular not to allow their children, before they are old enough to walk, to sit much on the carpet, as it is a posture unfavorable to erectness and fullness of figure. They are therefore taught, with especial pains, to roll themselves on the carpet, and to lie on the stomach, all of which has a direct tendency to secure a perpendicular spinal column and a broad, full chest.

It is a beautiful feature of English families that the children, instead of being pushed into a precocious maturity of dress, and manners, and habits, are children all along; their parents love to have it so—simple, free, joyous, playing, laughing, romping all they can. It is not the least of the advantages of this, that when womanhood comes, as come it will in spite of everything, it sets easily and gracefully upon them.

English children do not go to fashionable parties, or keep late hours. It is a special study to provide for them abundance of healthy sports, and above all to make home radiant with cheerfulness through the day; and when the night comes, the young misses, instead of staying up and being called ladies, are called girls, and sent to bed.—Happy Home.

GALLANTRY TO WOMAN IN RUSSIA.

GALLANTRY to woman does not seem to be cared for even by the highest classes in Russia. In proof of this we cite an incident wherein the actors are of the greatest of their class. The scene in the "Chambre d'or," and the days those of the late Czar Nicholas:

"In this Chamber and the adjoining ones, it is the delight of the younger Grand Dukes to drive their imperial mother in an easy wheel-chair. On one of these occasions, just as the brothers, side-by-side, were propelling the Taritzin at unwonted speed, and were entering the Chambre d'or, whom should they meet, coming from his cabinet d'affaires in an opposite direction, but their Imperial father, and what was more, their Tzar—and what was more important still in that Tzar's eyes—their General! The young Grand Dukes fully understood the nature of the 'fix' they were in, for to pull up stock-still in a second, like Circassian or Cossack blood-horses, was impossible, and to pass their superior officer without stopping to make the necessary salute, which is rather a lengthy affair, was equally impossible, for the indignity of arrest would assuredly have followed such a breach of military discipline, and that was not to be thought of for a moment; so leaving the impetus-propelled chair to its fate, about 'head up, arms down, heels together,' until their General—who could scarcely refrain from laughter—he is said to have indulged in a loud peal at the other end of the gallery—had passed out. The Empress, meanwhile, made the entire trajet of the Chamber d'or, the impetus having only expended itself as she neared the ranges of chairs which flanked the apartment, and where she received the dutiful apology of her 'younger' sons with her usual affability."

The young Grand Dukes, in fact, risked breaking their mother's neck rather than fail to salute their general! Not after this fashion did Cleobas and Bion honor their mother, Cydippe, when they harnessed themselves to her chariot, and drew her tenderly to the Temple of Juno at Argos, at whose threshold they were blessed by the gods, and died. But they were pagans!—Six Years Travel in Russia.

SUICIDAL WOMEN.

UNWISDOM above many is the man who considers every hour lost which is not spent in reading, writing, or in study; and not more rational is she who thinks every moment of her time lost which does not find her sewing.

We once heard a great man advise that a book of some kind be carried in the pockets to be used in any unoccupied moments. Such was his practice. He died early and fatigued.

There are women who, after a hard day's work, will sit and sew by candle or gas-light until their eyes are almost blinded, or until certain pains about the shoulders come on, which are almost insupportable, and are only driven to bed by a physical incapacity to work any longer. The sleep of the overworked, like that of those who do not work at all, is unsatisfying and unrefreshing, and languor, with an inevitable result, both dying prematurely.

Let no one work in pain or weariness. When a man is tired he ought to lie down until he is most fully rested, when, with renovated strength, the work will be better done, done the sooner, done with a self-sustaining alacrity.

The time taken from seven or eight hours' sleep out of each twenty-four is time not gained, but time more than lost. We can cheat ourselves, we cannot cheat nature. A certain amount of food is necessary to a healthy body, and if less than that amount be furnished, decay commences the same hour. It is the same with sleep, and any one who persists in allowing himself less than nature requires, will only hasten his arrival at the mad house or the grave.—Hall's Journal of Health.

GREAT and rare heart-offerings are found almost exclusively among women; nearly all the happiness and most blessed moments in love are of their creating, and so also in friendship, especially when it follows love.—Duclos.

No woman, even the most intellectual, believes herself decidedly homely.—Stahl.

HOPING—DESPONDING.

BY SPENCER F. TOOLEY.

O, the hearts that are so sorrowing,
Deep and bitter anguish borrowing,
Filled with fearful images, blackened with despair;
Hoping, striving, yet desponding,
Searching, longing, ever yearning
After brighter, better somethings in the grasping air.

Hear we seldom gentle laughter,
For the soul is some welling after;
Hearing sighs and rolling tears, like the ocean main;
Hear we seldom songs of sweetness,
Breathed in hours of joy's completeness,
For joy's blessed ray of sunshine is soon lost again.

Yet in darkness they keep yearning,
They keep longing, ever turning
To the time (endeared future) when on golden wings
Joy ecstatic, purest pleasure,
Richest blessings, without measure
Shall be brought and ever thrilling, thrilling their heart-strings.

Foible hope! the dreaded present
Finds all end in disappointment;
And them care-worn, weary, watching for a perfect rest;
Weary, watching and—'tis coming—
It has come, and they are slumbering,
Slumbering, undisturbed forever, in the arms of death.
Marshall, N. Y., 1859.

BYGONES.—No. III.

My Seminary Life.

My soul sickened and anon revealed in the false-ness and emptiness of life as I found it at the Seminary. To be otherwise than superficial required constant effort and unflinching resolution. The few conscientious teachers were sorely disturbed, but were obliged to yield to the wishes of their patrons. Young girls, whose deepest cogitations had never extended beyond the shape of a shoe, or the shade of a ribbon, affected to puzzle their brains with Logic and Geometry, Virgil and Upham, Astronomy and Rhetoric, finishing each in a certain allotted time, with scarcely a smattering of what they were designed to teach. Common sense fell below par in the demand for that exquisite sense which disables for the duties of life and affords scarcely a fitting preparation for its shifting pleasures. We almost came to think everything as false and empty as our recitations and examinations. A system of petty falsehood seemed the only perfected system of which the school afforded an example, and only the prematurely wary and discerning could escape being drawn into the toils. Study, earnest, faithful study, was not required, and, in many other respects, the whole establishment was a ruinous humbug.

Hours nominally devoted to the preparation of lessons were spent in idle gossip and frothy conversation and the recitation drawn through with no seeming purpose except to occupy the allotted time. The lessons were longer than an ordinary undisciplined mind could compass and doled out without comment or explanation by the teachers. Most of the graduates went out into the world with a smattering of French and Mathematics, and minds so confused that Chemistry was only a puzzle, Astronomy a myth, and Grammar an unsolved problem. Like the hurrying traveler, few had any just conception of the ground over which they had so rapidly passed, and none that balance and discipline of character which correctness and completeness always fosters and produces. Their so-called accomplishments were rude attempts at Drawing and Painting and murderous abuse of the Piano and Guitar. Fortunately my rapid acquirements and fruitless strides were too conspicuously evident at home, and I was immediately removed to another school, based upon principles totally different, and conducted with a spirit truly conscientious and Christian. I felt the growing incrustation of falsehood and pretence gradually melting under the softening influence of kindness and sincerity. Faint glimpses of a new life dawned upon me, a renovated spirit fresh and pure, rejoicing in all that is holy and noble. I found teachers imbued with that true missionary spirit which falters not under defeat, shrinks not from difficulties, waries not with dullness or carelessness, and never ceases to gaze with that far-seeing eye of faith beyond the discouraging present. I caught a dim glimpse of that beautiful inner life which soothes and cheers amid trials and sorrows and works out high and holy soul-purposes into beautiful realities.

The commonest practicalities are first begotten in this ideal atmosphere; it is the hope of the world—the heritage of the just. All projects or achievements famous in history or celebrated in song were created, refined and sublimated in this vast thought-world long before commencing millions speculated upon their relative merit or probable results. I felt my soul warming with this new element, so contagious and so freely imparted. I experienced the throes of that heroic existence to which after misfortunes gave birth and imbued the practical bearing of those sober truths upon which common life is based. The fungus growths of childhood disappeared with the later frothy excrescences, and health, pure and strong, developed new vitality. I saw that rigid school-system and unvarying regularity accomplished much, and that living to some purpose gave unbounded satisfaction. Studious work, unceasing and untold, redeemed the wasted years and built a mental fabric which time could not shatter. The chaos of confused thought gradually took shape,—the vagaries of imagination and the perceptions of sense settled to their proper rank and brought that confidence which growing development always gives the youthful nature. My destiny was in my hand, that strong hand, nerved for labor, calloused and hard. My strength was not all spent upon books—the striking diversities of character displayed about

me inspired intense study. I had a room-mate, whose strong human propensities, tempered by a high-toned intellect, were a perpetual mystery and an absorbing subject of speculation. I venerated the purity of her lofty purposes, and laughed at the betrayal of her numerous feminine weaknesses. Her scorn for meanness and her indignation at wrong were sublime; yet she was easily conciliated by their perpetrators with a few adroit words addressed to her natural and not exorbitant vanity. Incessantly industrious she forced everything to subserve to her accommodation and yet was generous of time and money. Bold, imperious, and determined by nature, she yet yielded away to the higher law of kindness and duty.—Beautiful contradictions and incongruous harmonies mingled in strange and confused regularity in her composition, and constituted my most laborious and incomprehensible study. Another fair girl, with deep black eyes, liquid in their distant depths, was a perpetual and unutterable delight to my musing hours. Through the rose-tinted medium of youthful vision, I beheld her pure, true, and lofty, yet humble. An indefinable charm, a conviction of unsullied purity hovered about her and none could doubt its genuineness or venture to mock at its trivial niceties. She had quick apprehension, but not that subtle, grasping intellect which some women possess; truly, peculiarly feminine in all her attributes, she had, in large measure, all a woman's weakness and her mightiest strength,—patient, forgiving and unchanging love and devotion. An inborn dignity allied to the delicacy of her nature gave her grace, modesty and firmness in a marked degree, and in marked combination. She met my full ideal of womanly perfection and I worshiped and loved without daring to imitate. She seemed a spiritual existence trembling in the clay, which was refined to such a degree that it involuntarily contracted and fluttered at a shadow of wrong or a touch of coarseness. She was a being to love with a holy affection,—the basest could offer her none other. It was unspeakably sad to see her fade in after days; a blight, a sorrow, heart-wrung and deep, touched her and she fainted, drooped and died—our darling ANNA.

I found continual pre-occupation in analyzing the variety of characters which a school, made up of such heterogeneous materials, always affords. I learned to sneer at that little, consequential air which position and property confer, and to fathom the petty mysteries which usually lurk beneath a demure face and a guarded manner. I accumulated a mine of thoughts and ideas, ever crowding and multiplying, from whence and where I could never know. It is impossible to trace those light impressions and subtle influences which people the inner world and form the burden of its fullness.—Our minds may catch tone and purpose from the falling of a shadow—a tinge of sunlight in the distance,—the glance of an eye,—the curve of a lip, or the emphasis of a word. Dreamy and absorbed as we think ourselves, we never escape the tender touches, the unfelt breathings of the immediate outer world. Who does not melt at gentleness, harden with unkindness, and refine in the diffusive presence of an elevated mind? Where is the soul so hardened that music may not soothe, so opaque that a beautiful landscape will not please, or so lost the voice of affection is not welcomed.

L. A. T.

SYMPATHY OF THE NERVES.

When the nerves, from long habit, have been accustomed to transmit their messages from distinct parts, and are suddenly cut off from them, they still retain along their trunks the sympathetic or sensational actions. Thus, a man who has had a leg amputated will feel distinctly along the course of the trunk the nerve sensation from toes which no longer exist. The mind also is influenced by this; and frequently this peculiar direct nervous action can only be allayed by that which is negative and reflex. A curious instance occurred within my own experience. An old sailor suffered much from this; he retained his diseased foot too long, but at last consented to amputation. I knew him only with a wooden leg. When he had his nervous pains, he always called for hot water, into which he put his wooden stump. If told of his folly in supposing that such a proceeding could do any good, he would become enraged, and his paroxysm of pain would increase; but if gratified, he took things easy, and the process actually appeared to do him good, though all must know there could be no real benefit. Still, here is the effect of mind over matter.—Ridge on Health and Disease.

QUAKERS.—It is noteworthy that three prominent Americans—Benjamin West, the great painter; Charles Brockden Brown, the noted novelist; and John G. Whittier, the gifted poet, should be of Quaker lineage. This fact is a remarkable one, inasmuch as the society of Friends, both in principle and practice, manifest a repugnance rather than a sympathy with the products of the imagination. Tom Paine, the noted deistical and political writer, was of Quaker parentage, but in early life renounced the faith of his family. John Neal was of Quaker family, but in his boyhood was "read out" of the drab fraternity for "knocking a man, who had insulted him, heels over head; for paying a military fine; for making a tragedy; and for desiring to be turned out, whether or no." It is singular that while Neal does not appear to have inherited any Quaker placidity of mind, his first novel was entitled "Keep Cool."

NEWSPAPERS IN THE OLDEN TIME.—In 1718, the Boston News Letter, which had been printed on a half-sheet of foolscap size, was enlarged so as to require a whole sheet. The publisher naively remarked that it was impossible "with half a sheet in the week to carry on all Publick News of Europe, though hitherto all those of Great Britain, Ireland, our own and our Neighboring Provinces have been yearly inserted." He was now thirteen months behind with the Foreign News, and to make up the deficiency, and to make all "new that used formerly to be old," he resolved to print a whole sheet every other week. What would our readers think of waiting fourteen months, fourteen days, or fourteen hours, even, for their foreign news?—Boston Journal.

THINE.

BY STEPHEN FORBES.

THINE! 'tis a little sound,—
Trace back its silver line,—
What labyrinth of thought are found
By that clue—THINE.

What heights of holy zeal,
What depths of love Divine,
What consecration true and real
In that word—THINE.

"Mine" is the golden key
That opens love's fair shrine,
Can any word more holy be?
Love's self is—"THINE!"

"Mine," says the manly voice
Beneath the hanging vine,
"Mine, O, my queen, my love, my choice!"
But she says "THINE!"

"'Tis better far to give,"
Spake CHIMNEY, the gift Divine,
Who said (and died) that we might live,
"Not Mine, but THINE!"

Two words of priceless worth!
Yet not alike they shine;
They, who with joy, say "Mine" on earth,
In Heaven sing "THINE!"

For Self is lost in Love,
And Life's round God shall twine—
We sum the ransomed about above,
In one word—THINE.

Utica, N. Y., 1859.

"KE PURGETH IT."

In a sermon on "Christ the true Vine," by Trench, we find this comforting thought, for those who watch and often wonder at God's dealings with his children:

"We sometimes wonder, with regard to some of God's dealings with the elect, that he should cast them again and again into the crucible of trial. It seems to us as though they were already refined gold. But he sees that in them which we do not see, a further fineness which is possible; and he will not give over till that be obtained. It is just as in a portrait by some cunning artist, which is now drawing near to its completion. Men look at it, and count it perfect, and are well-nigh impatient that the artist does not now withhold his hand and declare it is finished, while he, knowing better, touches and re-touches, returns again and again to his work. And why? Because those floats before him an ideal of possible excellence at which he has not yet arrived, but which he will not rest nor be contented till he has embodied in his work. It is thus with God and some of his elect servants. Men seeing their graces, which so far exceed those of common men, wonder sometimes why they should suffer still; why they seem to be ever falling from one sorrow to another. But He sees in them that which no other eye can see; the grace which is capable of becoming more gracious still; and in his very faithfulness he will not deprive them or suffer them to come short of this. They are fruit-bearing branches, and because they are so, 'he purges them that they may bring forth more fruit.' My brethren, how blessed must God's service be, when he can give nothing better to his servants in reward of their obedience, than the ability to serve him more and better."

A GLORIOUS THING.—Men of the world are sometimes ashamed to pray, and are unwilling to be seen in a praying circle, but they only proclaim their spiritual ignorance and blindness. The following paragraph indicates more wisdom and discernment:—"As John Foster approached the close of life, and felt his strength gradually stealing away, he remarked on his increasing weakness, and added, 'But I can pray, and that is a glorious thing!' Truly a glorious thing; more glorious than an atheist or pantheist can ever pretend to.—To look up to an omnipotent Father, to speak to him, to love him; to stretch upward as a babe from the cradle, that he may lift his child in his everlasting arms to the resting-place of his own bosom; this is the portion of the dying Christian. He was overheard thus speaking with himself:—"O death, where is thy sting? O grave, where is thy victory? Thanks be to God, who giveth us the victory, through our Lord Jesus Christ." The eye of the terror-crowned was upon him, and thus he defied him."

GOD ABOVE ALL.—An astronomer, who had long idolized his favorite science, became a zealous convert to spiritual Christianity. His intimate friend, knowing his extreme devotion to astronomical study, asked him:—"What will you do with your astronomy?" His answer was worthy of a Christian philosopher:—"I am bound for heaven," said he, "and I take the stars in my way!" By these words the astronomer taught his friends that he had transferred his affections from the created to the Creator; that instead of finding his highest pleasure out of God, he found it in God; and that the true use of the visible was to assist him in his aspirations after the invisible and eternal.

MR. ADAMS AND THE BIBLE.—In a letter to his son in 1811, John Quincy Adams says:—"I have many years made it a practice to read through the Bible once a year. My custom is to read four or five chapters every morning, immediately after rising from my bed. It employs an hour of my time, and seems to me the most suitable manner of beginning the day. In what light soever we regard the Bible, whether with reference to revelation, to history, or to morality, it is an invaluable and inexhaustible mine of knowledge and virtue."

If we love, we know how God feels; if we are just, we know in our measure how God feels—we have one letter of His alphabet.

THE TRAVELER.

LETTERS FROM A HUNGARIAN.

NUMBER EIGHT.

Hungarian Melodies and Dances—Departure for Vienna—Keeping "to the left"—Peculiar way of sprinkling the streets—General Description of the City—Cathedral of St. Stephen—Strange Numbering of Houses—Peculiar Thoroughfares—Possessions of the Viennese—Theatre and the Opera—Concluded.

DEAR FRIEND MOORE:—Though I spent only two months in my fatherland, and within that time made but few excursions into the rural secesses of Hungary, yet my notes on the Hungarian Life and Customs have swelled to such an extent that it would be matter of no great difficulty to weave them into a series of two or three letters more. But I am afraid that my poor skill in the art of weaving might produce but an ordinary home-spun texture, not possessing attraction enough to be displayed in the graceful columns of the worthy RURAL. I will therefore weary your readers with but one paragraph more about the genuine *Magyars*, and then hasten to the Capital of Austria—Vienna.

In the evening, when the Hungarian peasant has done with his task in the field or vineyard, he betakes himself with his comrades to the village inn, where, with the wine-cup in his hand, he chats on the works and incidents of the day, and not unfrequently (when no police or *gens d'armes* are around) about politics. Occasionally two or more musicians of that homeless people—the swarthy Gipsies—make their appearance and take up their position in a corner of the room. They strike up a tune on their fiddles and symbols. The first gentle, melancholy tones with which the national melodies of the *Magyars* begin, have scarcely vibrated on the air, when the young swain, who had thus far lain listless on the bench, rises, and as the notes rise higher and higher, his eye sparkles and his body begins to keep time with the music. He steps up to the Gipsies, tells them what air to play by singing the first verse of the song himself, (the dancing melodies are, at the same time, the national songs of the Hungarians.) And when the tender strains of the *adagio* gradually pass over into a more rapid time, his movements grow quicker too. He takes hold of the beautiful country lass, and the dance becomes more and more general, assuming the glow of passion. Suddenly, in the midst of the dance, the music comes to a violent standstill; the dancing couple remain immovable, as if some higher power held their passion in fetters. Then the music begins again in a sad, plaintive strain. The female partner slips out of the arms of the rural swain as if she feared to betray her feelings: by many a graceful turn she escapes the arm that would embrace her again, and the two dance separately. The dancer, as it were, relates his pain, his love. His motions follow the melancholy tones; gradually he approaches the hesitating girl,—and, when the slow *adagio* lapses into the boisterous *allegro*, his arm has seized her again, and, as if subdued by passion, they whirl about with nimble feet and glowing faces.

Such is the passionate love of the Hungarian to dance. He can hardly listen to a national melody of his country without leaping up and moving his limbs accordingly. The melody itself is as peculiar as the dance, which may be described as a mimic representation of ideas or emotions. The music being the melody of certain national songs, the corresponding dance resembles a conversation between the dancer and his partner; it is a mysterious talk—a confession of his emotions—a disclosure of his moved heart. This is the peculiar character of that most popular Magyar dance—the *Csardas*, (pronounced *tschardash*.) There is no rule by which it may be taught—as is the case with the language of passion—and, hence, none but a real Hungarian will ever dance it as it should be, without rendering it a confused, meaningless pell-mell. [I have since seen this very dance performed by the excellent ballet-dancers of Berlin; but—"bless me," said a Hungarian, who happened to be with me on that occasion—"bless me, if my countrymen and women do not make it better!"]

And now, gentle reader, will you embark with me for Vienna? I say *embark*—for I am still in the town of *Gran*, on the Danube; and though we might in less than one-third of the time reach the Austrian Capital by railroad, let us prefer the steamboat, as the slowness of the passage (the boat going up stream,) will be amply repaid by the ease and quiet of the journey, and what is better, the far more romantic scenery along the Danubian shores. It will lead you by the almost invincible fortress of *Comarn* which played so noble a part in the late revolution, that it surrendered only after a capitulation permitting its Governor (*Ujhazi*) and friends to seek a refuge in the "Land of the Free" across the Atlantic; it will show you *Presburg*, once the Capital of Hungary, with its lofty hill on which the magnificent ruins of the royal castle (destroyed in a conflagration, 1811,) tell you of the many Hungarian Kings who were crowned here since the sixteenth century, and who, after the coronation, would deal four strokes towards the four cardinal points of heaven, signifying that they would protect the land on all sides; it will carry you along many other objects of interest too numerous to mention here. Besides, it being just after harvest, you will see the river studded here and there by numerous flour-mills, whose mighty wheels are driven by the downward course of the stream. [In the winter, when the Danube freezes, these floating mills are drawn on shore.]

At length, after passing under several suspension bridges connecting the city with its suburbs, we are in the very heart of Vienna, and the very first thing that attracts my attention, as the hack carries me to one of the hotels in the city, is the notice, "*Hier wird links gefahren*," signifying that vehicles should keep to the left. I had always been taught to keep to the right when riding, (and such, I believe, is the custom almost everywhere;) it, therefore, appeared rather strange to me why they don't keep to the right here. But I satisfied my-

self (poor satisfaction that,) with the thought that there are a great many other things not taking the right course in Vienna, (and Austria generally,) and so my driver hurried me along "over the left" path, which, however, in this case, did not lead to destruction, as the streets are mostly very narrow. Riding in and about Vienna, is, in fact, very pleasant, as the streets are all paved with smooth stones like Broadway in New York.

The peculiar method of sprinkling the streets was another thing that at once excited my observation. Every sprinkling wagon requires two men, the driver, who simply guides the horses, and the sprinkler proper. The latter, with his pantaloons rolled up to his knees, follows the wagon on foot, wagging right and left a gutta-percha hose, through which the water in the wagon is conducted. When I at first saw this method, it presented a very ludicrous spectacle to me; for, the sprinkling wagon itself not yet being in sight, I thought the man was pulling the caudal appendage of some beast, while he, himself, seemed to be pulled along by the latter.

After having duly arranged my effects at the hotel, and, in accordance with the municipal regulation, delivered my passport to the host, I took advantage of the clear, bright sunshine, and walked abroad through the streets of the Capital. The city proper is only a league in circumference, surrounded by a wall, which is now, however, being in part demolished to make room for new edifices and forts. Yet within this small circuit about 60,000 inhabitants manage to breathe. Many of the streets are, in fact, so narrow, that two persons, standing in two houses opposite each other, might shake hands by putting them out of their respective windows. Besides, the height of the houses, many of which are from six to seven stories high, renders it physically impossible for sunshine to penetrate the lower stories. But by far the greater part of the population of Vienna, which is a little above half a million, live in the suburbs, (of which there are thirty-four,) outside of the city wall, the largest and most beautiful of which is the *Leopold-stradt*, which is separated from the city proper by the Danube. The beauty and grandeur of Vienna, however, are concentrated within the walls. Here is the imperial palace with its vast royal library and treasury; its collection of coins and antiquities, Zoological, Mineralogical, Botanical and Astronomical Museum; the University with its valuable collections; the most beautiful churches, theatres and mercantile edifices,—in short, the *life* of Vienna. Of the palaces, of which Vienna counts over a hundred, (such is the number of dukes, and princes, and counts,) none are distinguished for architectural beauty, though grand and massive in appearance. Berlin, in this respect, far excels the Capital of Austria. But the churches, reared by Catholic wealth—or rather by the onerous taxes of the masses—are truly magnificent, and even sublime; the most costly and beautiful of which is the *Cathedral of St. Stephen*. This church alone is worth a visit to Vienna. It is open from sunrise to sunset; and, occupying an entire square in the heart of the city, it serves not only the wants of the pious, but also the convenience of the hurrying passer-by—since, by going through the church, instead of going round it, a good deal of time is saved in going from one part of the city to another. Do not expect from me, kind reader, a description of this vast Gothic structure with its magnificent decorations—that would require a pretty thick pamphlet. But if you should ever visit this imperial residence, do not fail to ascend the lofty, pyramid-like, world-renowned steeple of *St. Stephen*, from which you will enjoy a most wonderful prospect extending to some of the bills of Hungary.

In walking through the streets, I noticed another strange peculiarity, viz.—the numbers on some of the houses—many of them displaying a number which is apt to mislead, if not utterly confound, the uninitiated. Thus, I observed the figure 1080 in a street which I am sure does not contain above 200 houses. And what is worse than all, the houses are often numbered at hap-hazard, so that in looking for any particular number—say 78—you will be not a little surprised to find it between such numbers as 900 and 1170.

Another peculiarity of Vienna, are the many thoroughfares leading through houses, from one street to another; by means of which the pedestrian saves many a long circuitous way. To the stranger these often appear as merely private yards; and fearing to be led astray by them, he prefers to take the longer route, as I have myself sometimes done. But when the shortest way is most practicable, do not hesitate to ask the next gentleman you meet. The Viennese, to their honor be it said, are so polite, that, if they pass by ever so rapidly, they will stop to answer your questions, and with hand and tongue will give you full directions—nay, even go with you back to the next corner, that you might the better acquaint yourself, and when you express your thanks will reply with that civil phrase, so glibly uttered by most every Austrian—"unterthanigster diener," ("your most humble servant.") So much for politeness in showing you through the crooked, irregular streets of the city.

Going into one of the numerous coffee saloons, (which are similar to those in *Paris*, and of which I have in a former letter given a description,) I took up the *Viennese Gazette*, and observed that at the royal opera-house "the Jewess" (music by HALÉVY) would be represented. The principal character of the piece (*Kecza*, the Jewess,) was to be given by M^{lle} Cutillo, who is herself a Hungarian Jewess, and is the prima donna at Vienna. Now, thought I, here is a Jewish subject, the music by a Jewish composer, the heroine herself is to be represented by one of her own faith, and—you are yourself a son of ABRAHAM—how can you, under so many coincident circumstances, refrain from going? And so I did go—but oh, what a crowd was there at the door before it was opened! And what a rush, when it was opened! and how they squeezed one another to the ticket office, and jammed their hats and tore their coats! I thought that the music can be heard as well in any part of the house, so I kept aloof from the boisterous mass, waiting till my turn. But though there were two ticket offices and many had already procured their tickets during the day, I had to wait full ten minutes before I could, without danger of being squeezed too hard, extend my hand to the ticket-hole. But, imagine my amazement, when the ticket officer asked me if I wished a standing-place,—there was no seat to be had in the parquette, nor first, nor second, nor third gallery! Such is the passion for operas in Vienna. But the crowds, I am told, are none the less great at the other nine theatres of the city, to say nothing of the masses resorting to the numerous concerts and other places of amusement. Well, I got in, satisfied with a convenient standing-place, and enjoyed the musical representation none the less. Any critical remarks on the performance itself would be of little interest to readers so far from the scene of action; I will only say that the singing was excellent and exercised a most beneficial influence on the heart, and close with the wish that similar operas might grow more general in America than the merely comical performances on the American stage.

Yours, SIMON TUSKA.

BARON VON HUMBOLDT.

A GREAT man has passed from earth. On the 6th of May, ALEXANDER VON HUMBOLDT died at Berlin, Prussia, aged nearly ninety years. In after ages, when many who are now thought great shall have been forgotten, and others are remembered only to be despised, the name of HUMBOLDT, shall stand forth in characters of living light, the admiration of the old and the young, the illiterate as well as the learned. He was great—his reputation world-wide—he belonged to nation, no country—no continent could claim him. He was truly a citizen of the world, and every man is proud to own him as a brother-man. He was great, but his greatness was not founded on family distinctions or national honor—princes and kings delighted to become his friends—yet he received from the association no honor—kings could add no lustre to his name—crowns could not adorn his brow. It is such an example as this that we delight to set before our youth, who are prone to think too highly of renown gained through blood and tears and woe—and the honors conferred by paltry office.

HUMBOLDT, as has been truly said by another, was a benefactor to the human race, and his career is a noble example of a long life well spent in severe physical and mental toil, whereby the sphere of man's information has been greatly extended and enriched. His memory was prodigious, his intellect active and acute, and his taste exquisite; and over everything which he wrote he threw the charm of a genial disposition and a generous heart. For the past fifty years he has been the Nestor of Science, and has gone down to the grave bearing the esteem of all men, and "laden with wealth and honors nobly won."

He was born at Berlin on September 14, 1769; his father was a soldier of distinction and a man of wealth. Left fatherless at the age of ten, Friedrich Heinrich Alexander—this was his name—was carefully educated by judicious relatives, and spent a creditable career at the universities of Berlin and Göttingen. His taste for scientific pursuits led him to devote especial attention to geology and mineralogy. His university studies were varied by excursions to the Harz Mountains, and to the vicinity of the Rhine, which occasioned the first fruits of his literary labors, in a work entitled, "The Basalt on the Rhine" in 1790.

His fame as a mineralogist was early established, and at twenty-three years of age, he was appointed to the important government post of Superintendent of Mines in Franconia. Having felt a strong desire to visit distant lands, he soon resigned this situation, and sold a large estate to furnish means for traveling in America. After many disappointments, he was at last enabled to visit the New World under the patronage of the Spanish government, and in 1799 commenced to explore the great valley of the Orinoco. During the five years he was a traveler on our continent, he visited the sources of the Amazon, climbed the snow-capped peaks of the Andes, and under a burning sun traversed vast plains, pestilential swamps, and barren deserts where the foot of white man had never trod before.

It affords us much pleasure to state that Baron Von Humboldt included a portion of our own country within his extended American tour. He visited Philadelphia, Washington, and our principal seaboard cities, and was personally known to some of our distinguished men, and was treated with distinguished attention by President Jefferson. He quitted this country in 1804, and returned to his native land. Our institutions made a most favorable impression upon his mind, and he ever afterwards retained a pleasant recollection of our people. His published accounts of these travels, attracted the attention of the whole civilized world. The field was fresh, the power of the author's description was vivid; they were filled with thrilling incident, and contained a mass of new geographical, botanical, and mineralogical information of the most interesting character. His fame was at once established by their publication, and honors poured in upon him from the scientific associations of all lands. They were printed in seventeen large volumes, richly illustrated with figures of the subjects described. They embraced geography, zoology, botany, mineralogy, the natural history of animals, astronomy, geology, climatology, in short, every branch of science. Some idea of the value of his American harvest may be gathered from the fact that his published account of his travels in South America and Mexico comprises seventeen volumes folio, and eleven volumes quarto, and costs \$9,000 a copy. It took him twelve years to write. So varied and profound were his attain-

ments, it was at once felt that he stood out in bold relief as the most accomplished traveler that ever lived.

Of late years, the name of Humboldt was made more widely known by his "Cosmos," a work written during the long and pleasant twilight of his life, in which he considers (and in this view he is right) all created things as linked together forming one uniform whole, and affording evidence of one great creative mind as the author of the visible creation. This work has been translated into several languages—our own among the number—and is replete with curious, varied and profound information.

With the King of Prussia he lived on terms of almost brotherly intimacy; and though his political opinions were much too liberal for his sovereign—he was, in fact, a thorough republican—he represented Prussia faithfully and honorably on several momentous occasions. The crisis of 1848 is said to have led to some decided expression of his liberal views, and for a time to have estranged him from his royal friend; but the separation was brief—the King was a very good man at bottom, and meant well—he could not live without Humboldt, who, for his part, was so much engrossed with scientific concerns as to be rarely anxious about politics.

The Prussians were so proud of him, and so fearful of losing him—strong inducements were held out to him to settle in France—that he was made a councillor of State, and given to understand that no favor would be too great for him to ask. He had no political ambition, however, and was happy in being able to prosecute his studies. After his Survey of the Prussian-Asiatic possessions, Nicholas would gladly have retained him in Russia, but Humboldt was too inflexibly attached to his native land.

Humboldt was ever at work, always in pursuit of knowledge and this he was willing to gain from sources apparently the most forbidding. He considered every man able to add a little to the stock of human knowledge. Every man was for him a teacher of something; every object a theme for study; every event a new problem solved, to be stored away in the proper shelf in his capacious mind. Tuckerman says of him:—"If delayed by the events of war from embarking on his American expedition, he occupied himself in ascertaining the height of the central plains of Castile; when becalmed on soundings, he examined the weeds collected on the lead to gain new light for the theory of the coloring of plants; the haze that for many hours concealed from his sight the Peak of Teneriffe induced ingenious speculations on the effects of atmosphere on vision." Our countryman, Mr. Squier, who visited him at Berlin, thought, after a few hours in his company, that the rapacious *avant* had pumped him dry about Central America; but he was mistaken, for, before his departure, an urgent note reached him from Humboldt imploring him to say whether the potato disease had ever existed in Nicaragua!

Between Americans and Humboldt there always existed a strong bond of sympathy. His early travels; his republican opinions, and his intimacy with some of our greatest men, always led him to feel a strong affection for the United States, and to show to American travelers more attention than to foreigners generally. It is not enough to say that his regard was reciprocated by the American people. No foreigner enjoyed such general veneration in this country as Baron Humboldt. The proposal which was made to leave the Oregon dispute to his arbitration was one of the many evidences of the unexampled esteem in which he was held on this side the water.

MIND AND BODY.—The necessary connection of the condition of the body and of the mind is matter of universal and constant experience. Mental influences affect the physical health; and the state of the body, on the other hand, exerts powerful effect on the mind. In treating of health, it is therefore necessary to consider the management of the thoughts and passions. In some diseases physical and mental disorders are so complicated and blended together, that it is impossible to tell in which the derangement had its origin. Even when the disturbance does not go to the length of disease, the mutual influence of the mind and the body may play an important part in the question of health. The body is constantly acted on through the mind, and this way of reaching and influencing the corporeal health deserves more attention than it usually receives.

YOUNG RURALIST.

HIGH NOBLES.—Under this heading a young correspondent sends us the following article, in which he stoutly maintains the honorable nature of the farmer's calling, and handles those pretty severely who are disposed to think it otherwise.

"I had rather live in the village, on potatoes, than live here where Mr. — does, buried up in country," said a dashing young man. The gentleman spoken of was a thrifty farmer, and a well educated man. He had a neat cottage situated on one of our main roads, and everything around him bore the marks of industry, neatness, and comfort. Enjoyment always supplanted him and sat at the open gate. Do you suppose that this young man ever thought, as he sat down to the well filled table, that he was indebted to the farmer for that nice white bread, and those beautiful *Peach Blows*, or *Africans*, just ready to pop open, and that delicious cut of steak? Did he ever think that he was dependent on the farmer for that glossy coat of black, and those rich Cassimere pantaloons? I am not a farmer, but my whole heart goes out to those bronzed faces and toil worn men of our land, and many has been the time that I would have gladly exchanged the cares and petty strifes of business for the more quiet and pastoral cares of the farmer. It is true, that he must encounter storms, but Nature's storms are not often like our commercial ones. If the young men of to-day all thought as this young man does, these smiling fields would soon become a howling wilderness.

YOUNG RURALISTS, if you are tired of home and its comforts, and are longing for a town or city life, I would advise you to turn back and take hold of the plow handle with a firmer grasp and labor and study, and wait for destiny to shape your course. You will be wanted! All steady and active young men will be wanted! The road to distinction is as easy from the furrow as from the counting house or professional chamber.

Spencer, Tingo Co., N. Y.

Cure.

Our correspondent should remember that though the farmer raises the wool, without which, of course the cloth could not be made, yet it is the skill acquired by the manufacturer that makes it so beautiful, and he is assisted by the inventor and the machinist, who make the machinery by which it is so well and cheaply done. One trade is dependent on the other, and the head might as well quarrel with the body, or the feet with the hands, about the position of honor, as one trade with another. Every useful occupation is honorable.

Another is determined to obtain a collegiate course of education, if he can do so by means of hard labor. This is right. A good education, if rightly used, is a great blessing; but by bad use it is often made a curse to its possessor and the world. A young man who has his eyes open, and keeps his "thinking cap" on, however, will not die ignorant, even should he never enter a college. Opportunities for improvement are plenty, and a thirst for knowledge is sure to be gratified. But W. S. we think is a little too fast in calling all "old fogies" who do not think he is pursuing the wisest course. But, here is the letter:

MR. EDITOR:—Your subscribers and correspondents often inquire through the columns of your valuable paper for information in regard to diseases, their cures, &c. I would like to inquire relative to a certain disease with which the folks in these parts think I am afflicted, and which if I do not rid myself of soon will prove my ruin. It gives me a very strong desire to read newspapers and books, and of late has given me a strong desire to take a college course and educate myself for a profession. This I will have to accomplish by my own means and hard labor, and without any assistance but plenty of opposition from the old fogies, who talk of nothing but the imperfections of human nature, because all will not dig in the dirt for a living. They think a young man foolish to spend money for newspapers, books, and everything which tends to lead man into a more useful sphere of action.

Niagara Co., N. Y., May 18, 1859.

A YOUNG LAWYER.—Here is a letter from a very young gentleman, as the writing plainly shows:

MESSRS. EDITORS:—I think I have got to be old enough to write a few lines for your paper, and in the first place I will tell you what I think of farming. It is in my mind a real dog's life, and I take no delight in it, for it is *work all the time*, and I am sure there is no use of killing yourself by work. It is well enough to *work part of the time*,—in fact I love to work some, but there is no use in being a slave all your life. For my part I mean to be a lawyer, and there can be no scaring me out of it, for I prefer studying and learning to farming or anything else.—H. S. C., *Monroe Co., N. Y.*, 1859.

This is quite prompt for a little man. "All work and no play," will make a dull boy and man, too. But no class of people have more leisure time than the farmer for reading, and as for study, no man can be a good farmer without constant study. As H. S. C. grows older, we have no doubt he will grow wiser, and things will seem different from what they now do.

THE GREAT MEN OF OUR COUNTRY.—A young friend, fourteen years old, sends us sketches of many of the great men of our country, with remarkable incidents in their lives, and closes by saying—"America can boast of men and soldiers far superior to any born on European soil. True, Europe can boast of NAPOLEON, of a CROMWELL, of a QUEEN VICTORIA, and many others, but she cannot boast of a WASHINGTON, or a JEFFERSON, or a FRANKLIN, or a TATLER, or a SCOTT." Modesty is a great virtue in an individual, and not less so in a nation, and it is not well to boast too much of our greatness, or of our great men. Of WASHINGTON we have a right to be proud; he was so transcendently great and good that all we can claim is acknowledged by the civilized world. His reputation is world wide. So is that of HOWARD, the Philanthropist. Such characters belong to no nation, but to humanity.

COUNTRY AND CITY BOTS.—We have received several articles on this matter, but they contain nothing new or important to justify their publication. We have already given both sides, and the facts in the case are apparent. All are not good, either in the city or country. Mean, dishonest, vulgar men and boys are found everywhere, we are sorry to say, and engaged in every calling.—Let all YOUNG RURALISTS pity the bad and imitate the good.

MOORE'S RURAL NEW-YORKER,

AN ORIGINAL WEEKLY
RURAL, LITERARY AND FAMILY NEWSPAPER.

CONDUCTED BY D. D. T. MOORE,
With an Able Corps of Assistants and Contributors.

The *Rural New-Yorker* is designed to be unsurpassed in Value, Purity, Usefulness and Variety of Contents, and unique and beautiful in Appearance. Its Conductor devotes his personal attention to the supervision of its various departments, and earnestly labors to render the *Rural* an eminently Reliable Guide on all the important Practical, Scientific and other Subjects intimately connected with the business of those interests it zealously advocates. It embraces more Agricultural, Horticultural, Scientific, Educational, Literary and News Matter, interspersed with appropriate and beautiful Engravings, than any other journal—rendering it the most complete AGRICULTURAL, LITERARY AND FAMILY NEWSPAPER in America.

All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.
For Terms and other particulars, see last page.

THE FLUKE, OR PRINCE ALBERT POTATO.

For some time we have been waiting for the information necessary to enable us to answer with confidence some questions in regard to the identity of the *Fluke* and *Prince Albert* Potatoes, its history and quality. In March last we said, in answer to a correspondent, that the *Prince Albert* had not been cultivated in this vicinity, that we could learn, but promised to try it the present season. Accordingly, we sent for seed, and on opening the package, were not a little surprised to find that the English *Fluke* had been sent us. From the description we had a little suspicion that they were one and the same, and this seemed to be confirmed. To arrive at a certainty on this point, however, we obtained specimens of *Prince Alberts* from two other sources, and received *English Flukes* every time. We know of persons who have paid \$1 and \$1.50 per bushel for *Prince Alberts*, while the same were selling in this market under the name of *Flukes*, for about 60 cents. Now, we have a great curiosity to know who gave the *Fluke* Potato its new name, and the motive for so doing. Had the *Flukes* become so common that fancy prices could no longer be obtained, and it was necessary to find a new and taking name? So far as we can learn, it was never known by that name in England, and it is undoubtedly a dodge of some Yankee speculator. Any of our readers who can furnish information on this point will please do so.

Of the quality of this potato there is a variety of opinions, some considering it the best potato grown, while others think it almost worthless. The same difference of opinion we see exists in England. We copy the following remarks by a writer in the *English Cottage Gardener*, which may throw some light on the cause of these antagonistic opinions:

"Many speak of the *Fluke* Potato in such high terms as to pronounce it unequalled; whilst others condemn it as decidedly the worst Potato they ever grew. I will offer a few remarks respecting this Potato, in consequence of the divided opinion that still exists respecting its merits. I have, on several occasions, heard people exclaim, 'Somebody must tell lies; for one party recommends it, while another condemns it.' On several occasions, also, I have witnessed different growers digging up their crops of *Flukes*, and have frequently asked them their opinion; which may be summed up as follows:—'Well, master,' I would say, jokingly, 'are they good?' The reply would be, 'Ah, good for the pigs.' I will never plant another *Fluke* as long as I live.' Another, perhaps, would be more favorable, and say, with a smile, 'They are the best croppers and boilers I ever saw in my life.' On the other hand, others would raise the following objections:—'Too rank in the haulm'—'too much deformed.' While the first season the complaint was, 'Not one-half came up that were planted.'

I will state my opinion respecting the culture and merits of the *Fluke* Potato. The *Fluke*, being rather a coarse grower, should be planted on rather poor soil. When planted on rich manured land, the tubers become deformed, the haulm exceedingly coarse; and, in consequence, warmth is not admitted to the tubers, nor light and air through the haulm. The tubers do not get thoroughly ripened; the strength of the haulm keeps up the sap until so late in the season, that the skin on the tubers merely gets set, and not properly matured. Such Potatoes cannot be expected to boil like a ball

of flour, or to eat in flavor equal to a well-ripened variety.

The *Fluke*, planted on poor soil, new broken land, or sandy, does well, brings perfect tubers of moderate size; the haulm, being of moderate strength, dies down in sufficient time to ripen the tubers as they should be, while the quality is of the first class. The fault thus lies not in the Potato, but in the soil, or the method of cultivation."

We have eaten the *Fluke*, when it was fine, and we would have pronounced it next to the *Maxim* for baking, and again when we thought it worthless. It is of good flavor, as a general rule, though not as dry when boiled as we like, particularly the large, and perhaps overgrown specimens, and the stem end is apt to be quite wet. It ripens late, and in rich, moist ground, seldom matures. The skin is thin, and white, and when dug before fully ripe bruises easily and turns black. When well ripened, carefully handled, and kept from exposure to the air, there are few handsomer potatoes; and when well ripened in a rather poor, sandy soil, it is a very good table potato.

The *Fluke* Potato was raised from seed in 1842, by a weaver named JOHN TURNER, in Lancashire, England. He raised a number of seedlings, but this being the only one he thought promised well, the others were thrown away. He made presents of the tubers to his neighbors, particularly the farmers around, but never made a penny of them in the way of trade. About 1850 they began to attract pretty general attention, and a number of gentlemen, in 1853, raised a subscription of about \$500 as a reward to Mr. TURNER for raising this potato, and its gratuitous distribution. We cannot say when it was first brought to this country.

HOUSE-BUILDING—No. III.

Of the various materials that have been used in constructing human habitations, let us take into special consideration only those most commonly brought into requisition, viz: wood, brick and stone, and see if some better way may not be devised in putting them together than is ordinarily tried. In case our efforts are successful, you may possibly be induced to build in a more substantial manner than did your ancestor, who reared the pioneer tabernacle which you now inhabit, but which is so fast going to decay over your head. Much has been said in favor and also against the use of each of the above mentioned materials; therefore, it is, perhaps, fair to conclude that a good house may be built of either, and that the best you can do will be to use that which you have at hand, or that which can be most easily obtained, rather than incur the extra expense of procuring a foreign material, in hopes of out-doing your neighbors, or because Mr. Such-an-one has done so before you.

If you have the timber, you will find it best to build of wood, and use for a side covering clapboards or vertical ceiling; if the former, the studs should not be more than sixteen inches apart from centre to centre, nor should the siding be more than six inches wide. Should you desire to make your house warmer than this, you can do so by covering it with inch sheathing before it is clapboarded, by filling in between the studs with brick, or by using an extra partition of lath and plastering, put on cleats nailed to each side of the studs, about two or three inches back of the inner edge. If you choose to use vertical ceiling, the cheapest and best way is to stud the same as for siding, except set the outside face of the studs two inches within the face of sills and plates. Outside of these spike 2 by 4 girts as ribs, horizontally, and about two feet apart, to receive the ceiling. Lath to the studs on the outside, between the girts, before the ceiling is put up, and put on a coat of coarse mortar between the studs on the inside before finishing. A good up-ground cellar may be made in this way, by adding studding on the inside, and another coat of mortar, making, in all, three separate partitions of plastering, besides an outside ceiling.

In case you build of brick, have a hollow wall by all means. If your mason is careful in laying it up, a two inch space is sufficient. The plastering will be much more durable on the brick than it will be on furring, and your building will be dry if you attend to two things. First, To prevent the moisture from rising from the foundation into the brick wall by capillary attraction, lay a plank or continuous course of roofing slate under the first floor joists, so as to entirely disconnect the inside portion of the brick wall from the stone wall. Second, Ventilate the hollow. Use for headers or bonders, brick, or oak lath, cut into proper length. Insist on having your brick wet just before they are laid. Your walls will be stronger and dryer if this done. If your brick are of uniform color, give the outside two coats of boiled oil. If you wish to paint, do not plaster the out-

side, but make it smooth by filling the joints and imperfections with mortar, and rubbing the entire wall down with brick. This makes a good surface for painting, and leaves nothing to flake off. All window sills and projecting caps should be constructed with a drip, so that the dust and dirt that lodges on them, as it washes off will fall away from the building, and not streak down the sides.

If your walls are to be of stone, lay a course of slate or flagging stone just below the water table, the entire width of the wall, and with the edges closely fitted together. If the stone are from the quarry, have them laid in their natural bed, and not stood up edgewise, to give them the appearance of larger blocks. If the stone is of such a kind, and the building of such a character, as to admit of or require a hammer dressed surface, do not fancy that they need to be all of the same size and shape, so as to look like an elongated cheese-board when put up. Mixed work is better. There is a saving of material, it admits of proper bonders, looks better, and gives the workman a chance to display his skill and taste. Walls built of quarry or field stone, may be greatly strengthened by laying in strips of hoop iron or wood lath, throughout the wall, and particularly at the angles. A house built of this material, and in this manner, protected with a wide projecting cornice, will be dry, even if the plastering is put on the stone itself.

It is pretty generally conceded that the American people do their work in rather an unsubstantial manner—and a simple glance at the crooked buildings, cracked walls, broken lintels, ragged arches, hollow-backed roofs, lop-sided cornices, rattling windows, dragging doors and squeaking floors, to be met with everywhere will satisfy the most incredulous that builders, at least, should not find fault with this almost universal judgement. Not that the builder is always altogether to blame, for if the work is by the job, and let to the lowest bidder, he must drive it through to save himself; or, if by the day, the more he does (if not so well) the better it suits the man who pays—not perhaps because the latter wishes to get more than the worth of his money, but because he has planned his house to cover so much ground—that if well built his money would not cover the expense.

Pompey, Owen Co., N. Y., 1859. J. E. S.

TO PLOW BOYS.

BEING fresh from the plowed field, I wish to say a word, while my mind is upon it, about plowing green sward. The great point in plowing is, a complete inversion of the soil. Having not unfrequently taught men to plow, it would not be strange if some of the rising generation who read the *RURAL*, might be benefited by a few thoughts upon plowing. It is possible you have not learned to plow, but have been presumed by your parents and employers to know how without teaching, as if farming was not a science. Come with me, then, to the field.

In the first place, to plow green sward well you must have a steady, well-trained team, that can be guided rather by the voice than the rein, for the attention of the operator must mainly be upon his plowing. The lines should pass around the neck; the ends may be of cloth to prevent friction. Next, your plow should be bright and smooth, and the point likewise. You should feel the point to cut rather than tear the sward. Strike the first furrow as nearly straight as possible. If not cut perfectly clean and completely turned, return again in the same, for much depends on the starting point. If the plow is thrown out by a stone, back up and start again. By all means do not let your go-aheadiveness make a balk, for I want you to make the field look as if penciled by a De Moivre. If using a side-hill plow, drive straight out; do not let the furrow bend up or down. It would be well to cut a guide furrow upon each head land at the outset. As to depth, much depends on your skill in regulating the draft. The point to be attained is that which turns the sward the best. This point you can only find by a series of experiments. You must alter the bolt, take up or let out tugs, till this is discovered. You must make this discovery yourself, for plows and soils differ. A plow-boy a discoverer, say you. Yes, a discoverer, a second Columbus, with this difference,—he plowed unknown seas; you are exploring untried soils.

FIG. 1. FIG. 2.

Having said this much upon the particular art of plowing, I want you to plow a field inclined at

LITTLE BUFFALO HARVESTER.—AS A MOWER.

an angle of forty-five degrees, as shown by fig. 1. I presume that you will be able to perform it tolerably well, because the force of gravity, combined with the action of the mold board, will assist you. But I have another field I wish to put you in, (such as I am planting this season,) approaching as nearly to a level as indicated by fig. 2. It is stony and the sward tough, and I want you to plow it with a side-hill plow as before. I do not wish the furrows to stand up edgewise, but to be rolled over neatly and evenly, and laid snugly together. I want you to do it, too, without breaking any of your ribs. In a stony country, it is considered quite a feat to plow any length of time without being injured in the breast. I have known several to be seriously injured, ribs broken, &c., by the plow handles. You must, then, if you would be safe and plow well in hard and stony soil, walk on each side of the furrow, instead of in it, as is the custom. You must not take hold of the tips of the handles, but grasp firmly the middle. Your right or left foot, as the case may be, should follow closely the action of the mold board, accompanied with a slight swaying of the plow in the same direction. By this method the vital organs are above danger, and the blows are taken by the hips and thighs. Besides, the blows are modified by our being so much closer to the plow. We lean, too, upon the handles, as upon canes, and the pressure of our foot upon the furrow, as we advance, does not fail in almost every instance of turning the most stubborn sward.

Cambridge Valley, N. Y., 1859.

H. K. F.

THE LITTLE BUFFALO HARVESTER, AS A MOWER.

IN the *RURAL* of May 21st we gave an illustration of "Kinsey's Little Buffalo Harvester as a Mower," and now present an engraving of the same machine as a Reaper. We are unable to speak of the merits of this machine from personal knowledge, but give the following description of its construction, operation and advantages, in the language, and of course upon the responsibility, of the manufacturers:—"This machine stands without a rival, it being the only One Horse Combined Mower and Reaper ever yet invented; and while it is the best, it is also by far the lowest priced combined machine in market, and supplies the want, and comes within the reach, of every farmer who needs a Harvester. The Little Buffalo is a combined machine, and the mower is converted into a reaper merely by bolting on the platform and raker's seat. The grain is delivered in well formed gavils at the side, out of the track of the machine, on the next swath, and the raker's position enables him to control and deliver the grain with perfect ease without a reel. For reaping lodged and tangled grain, this machine is unequalled. It cuts a swath four feet wide, and is capable of reaping from 10 to 15 acres per day. It is easily handled by one horse, or a pole can be attached to use it with a span of ponies if desired. The day is past for selling single mowers and single reapers. Every farmer who wants a machine at all, wants one capable of performing both operations, and here is one which is a perfect combined machine, and while it is the lowest priced machine in market, it is by far the lightest draft, most desirable and efficient.

"Having thus given the reader full illustrations and descriptions of the celebrated Kinsey's Harvesters, we will now briefly enumerate some of the reasons why we believe them to be the best machines in market; and, in doing so, will simply classify the different machines before the public, as they embody similar principles, and point out the difference between them and the Kinsey Machines.

"1. INDEPENDENT-ACTION MACHINES.—These machines have been introduced within three or four years. Their distinctive feature is their ability to work on rough ground, and this is accomplished by the independent action of the finger bar, which freely rises and falls in following the inequalities of the ground independently of the driving wheel. This independent action gives the machine so many advantages on smooth as well as rough ground, that the older machines, not possessing this feature, are fast going into disuse. Wherever the independent action machines have been used, they are the general favorites. There are two ways of attaining this independent action. 1st. By a peculiar mode of attaching the driving wheel to the main frame, thus establishing the independent action between the wheel and frame, as in the Kinsey Machines. 2d. By a joint or spring in the finger-bar, near its connection with the frame, establishing the independent action between the bar and the frame.

"With the last mode it is necessary to use two wheels to carry the frame, or the machine would tip over, and these two wheels track so wide that in reaping it is impossible to deliver the grain at the side out of the way of the next track, and this, together with the difficulty of sustaining the jointed bar off the ground, has prevented them from being successful as reapers. But as mowers they have attained a high reputation, and are undoubtedly far superior to the old-fashioned, rigid-bar machines. Still we think that Mr. Kinsey's method of attaining the independent action is decidedly the best, for, while it permits him to make a perfect reaper of his machine, it gives him many advantages over the two-wheeled, jointed-bar machine in mowing. For instance, the Kinsey machine, having but one wheel, can run in a ditch while the bar runs on the bank and cuts. No two-wheel machine can do this, nor can it run wherever the form of the land has a tendency to bring the machine into a similar position. Hence the Kinsey machine can be used on much rougher land than the two-wheel machines. Again, in the jointed-bar machines, the joint comes in the very place in the bar where there is the most strain, and the joint must necessarily bear this strain and wear rapidly. It also comes near or at the point of connection between the connecting rod or pitman and cutters, and the connecting rod is never in line with the cutters except when the machine is working on a dead level. Whenever the finger-bar is out of level the connecting rod works at an angle, binding the cutters, and sometimes so much they cannot work at all. None of these objections hold against the Kinsey Machine. The finger-bar is stiff and firm, and yet perfectly free in its play up and down. Either end of the whole bar will rise and fall without any cramping to the machine, or connecting rod, or cutters. Whatever may be the angle of the bar the connecting rod is always in the

some line, and the cutters perfectly free. With its one wheel it can run anywhere; it is very much lighter in draft, more simple in construction, and being an iron, instead of a wooden machine, it is much more durable, and more portable and convenient in all respects than the two-wheel machines. Thus, while the independent action machines are very much superior to, and destined to supersede all others, we think it demonstrable that Mr. KINNEY's method of obtaining the independent action is the best for a Mower, and the only one that is practical in Reaping.

COMBINED MACHINES.—As we have seen, the KINNEY is the only successful Combined Machine among the independent action machines—and among the old fashioned rigid-bar machines there never has been but one that has attained much reputation as a combined machine. The independent action gives the KINNEY an incalculable advantage over the rigid machines in mowing, and we will only take space to point out some of its advantages in reaping. The independent action allows the cutters to be set at any height in a moment, thus adapting it to all kinds of grain.—The platform is of peculiar form, extending back in an angular or curved shape, giving ample room for the grain, and permitting the rake to deliver it at the side by an easy sweep of the rake; it is fastened on top of the iron finger-bar, giving stiffness and strength, and allowing the cross braces underneath to have a bearing from the bar. The platform can thus be made both light and strong. The common position for the rake on the other machine, is standing upon the back or outer corner of the platform, with his breast against a support, where, by main force, he pushes off the grain. To sustain his weight the platform and its support must be strong and heavy, and all must be carried on the small platform wheel, necessarily increasing the side draft, and every time the little wheel drops into a hole or passes over an obstruction, the pole is thrown against the horse's side, and the rake receives a blow on his breast from the support against which he leans. In the KINNEY machine the rake is placed behind the horse, (where he can dispense with a driver,) on a comfortable seat, his weight directly on the driving wheel, where it is most easily carried, and in the best position for controlling the grain and delivering it at the side. This position of the rake, and form of platform, are secured by patent. These are some of the reasons why we deem the KINNEY the best Combined Machine in market. Did space permit, we could give many more.

ON PLOWING DEEP AND SHALLOW.

In perusing the RURAL, my attention has been drawn to a number of articles on "deep and shallow plowing." Being an agriculturist, I was considerably interested in the discussion, if it may so be called, but was disappointed in not finding more reasons advanced on both sides.

Now, it is well known that whatever a man does in agriculture, or any other occupation, if he understands his business, can, if he sees fit, give some reason for so doing. So, if a man in tilling his land plows deep he should be able to give his reasons for so doing, as well as the benefit he derives from it. One man, in defence of shallow plowing, refers us to Nature, and says that the seeds of trees and plants growing naturally are sown, as it were, without the ground going through any course of tillage whatever, except being mellowed and pulverized by frost. But his argument would hardly hold good in southern climates, where vegetation has a far more rapid growth than it has here, and frost is hardly known. Again, a great many seeds sown in that manner lay for years before they even begin to grow, which would hardly do for us as agriculturists depending on our crops yearly. However, we will agree with him in plowing shallow, but on the proper soil for it. We have not the least doubt that plowing five or six inches, deep on a soil which has for its foundation gravel, or shelly rock, is as good as, or better than plowing it eight or ten inches deep. But let him try it on stiff, heavy clay, and he will soon find the difference. In the first named soil water never stands for any length of time, but quickly makes its way downwards through the open strata below; thus leaving the land as dry as before the rain.—And we do not know but deep plowing would have a bad effect; as the substance of any manure placed on it would the more rapidly leach away through the bottom, and, thereby, not be so beneficial to the land as if it were not plowed so deep; but in clay soil, such as we have to deal with, where if you scrape out a hole below plow depth the water will stand as in a bowl, it is a different thing—some other kind of tillage is required.

Now the question arises, what is required? If you till heavy clay until it becomes as fine as you could desire, at the first rain it becomes saturated down plow depth; in a few days of hot sun and drying wind, it becomes baked as hard as it was before being plowed, and any crop sown on it will find it difficult to make its way thro' to the sun—and when it does come up has rather a poor appearance. Now, it is easily understood that a rain sufficient to thoroughly saturate and make mud of land that has never been plowed more than five inches deep, would not have the same effect on land that had been plowed eight or nine inches, which is considered a good depth.—Neither would it dry out so quickly or become so hard as in the first case. But we frequently have rains that fill the ground with water to that depth even, thus rendering it unfit to work upon for some time, as such a soil does not admit of being worked while very wet. To remedy this we must use the subsoil plow, and, by running that so as to break the hard soil six or seven inches below plow depth, allow the water to descend as much deeper and give it a better chance to drain away at the bottom. Then, the rain that would fill the soil plowed to the depth of eight or nine inches, thereby rendering it unfit to work upon, would hardly affect it at all.

Another advantage obtained from deep plowing in clay soil, is found in localities subject to severe droughts, as is the case with us. It will be found if you plow land shallow, evaporation goes on rapidly in hot weather, and in a few days, at most, after a rain the soil is as dry as before. But,

on the other hand, if the land be subsoiled, it gives the water a chance to go down in the cool ground below; and we know it must take much longer for moisture to evaporate at five inches below the surface than it would at five— and by its thus evaporating gradually it leaves the land soft and moist for a much longer period. In fact, you may till a fallow on clay in ever so dry a season, if it be subsoiled, and you will always find it soft and moist, and grain when sown on it will come up rapidly. Some may think the labor and expense attendant on such a course will amount to more than the profit derived from it, but remember that, although it takes strong teams at first, you have it to do but once for, when ground is once broken in that manner, it never becomes as hard again; and in that respect I must differ from my friend that advocates shallow plowing, who argues that ground will settle together harder, from being broken up. However, I do not pretend to advocate deep plowing on all soils, for, as I have before stated, there are some where shallow plowing is preferable. For instance, the interval lands along the Mississippi, where merely stirring the surface of the soil enough to cover seed and keep down the weeds is quite sufficient. But in respect to plowing deep or shallow, farmers must depend upon their own judgment, and plow according to the soil they have to till.

Ashton Place, Glasgow, C. W., 1859.

DRAINING WITH TILE.

FRIEND RURAL:—In your issue of May 28th, an inquirer, J. A. T., of Port Gibson, wishes information in regard to tile draining. Although it may be difficult for any person to say how long tile may last, I will reply that I do not know the man who has ever witnessed the final dissolution of a well-made tile, from suitable clay. In order to drain land, tile should be laid at least two-and-a-half feet deep. With a fair fall, hard bottom, pipe tile and the work well executed, your inquirer may rest assured he will be relieved from trouble with surface water. I would not lay horse-shoe tile. In using sole tile, I should allow it to meet on middle of sole. On soft or mucky bottom I would prefer board bottom.

As to the "stone throat," to me it is evidently useless. If memory serves me, it was in 1854 that my friend, and then neighbor, Wm. P. OTTLEY, put down two drains, one, say 25, and the other, perhaps 16 rods. He used horse-shoe tile, as he could not then procure the pipe. In part of his drains the bottom was not very hard, so he laid in boards for tile bottoms. After placing his tile he covered them with stones, so that if from any cause his tile should fail, the water might filter through the stones, and thus answer all purposes. The plan, and his execution of it, pleased me at the time; and it was on the representation of those drains, to the State Agricultural Society, if I am not mistaken, for which said Society awarded him *Premium Medal*.

In order that Mr. OTTLEY might underdrain his land, it was necessary that I should do the same in a field of mine adjoining his, but a little lower, and which lay so low as to suffer very much from surface water. I laid pipe-tile, connecting with his, which received all of his water and carried it off and kept mine thoroughly dry. In a conversation with Mr. O. in March, 1858, upon draining, we spoke of the drains above alluded to, both agreeing that the stones were not necessary.

I like stone for wall, wherever I may need one, and especially for line fences—but for underdrains there is nothing, to my mind, that equals good pipe-tile.

Phelps, N. Y., June, 1859.

CEMENT ROOFS—MATERIALS, &c.

DEAR SIR:—Reading the RURAL of the 14th of May, I observed the inquiry of P. H., Milan, Ohio, about Cement Roofs, with a request that the answer might be made through the columns of the RURAL. Now, I have not the least ambition to appear in print, but I have an idea that I think might be valuable to P. H., and to many others (if I am right). As his name is not given I am under the necessity of asking you to add it and forward it to him for his own consideration, and I shall be happy to have him or anybody else controvert or gainsay to me the ideas I shall suggest.*

I do not profess to be learned in earths or airs, but from my knowledge of natural laws I understand that in their natural state all earths are susceptible of expansion and contraction—that, if the expansion is occasioned by the introduction of water among the earthy particles, frost will swell that water, and occasion a rupture in the mass, and by repetition will enlarge and continue such rupture till a passage is formed for water to pass through. Therefore, judging from this belief, it would be my opinion that no cement made from earths could be made to remain impermeable to water. But I do believe that a cheap, tight roof and covering to a building can be made from an earth; but it must be changed from its natural state; heat and carbon must be introduced, and it must become vitrified—then water cannot penetrate it—air will not pass through it, and fire will not ignite it. If this is all right it must be matter of consequence, for if the torch of the incendiary could be rendered harmless and the fire insurers could be made producers, active labor would receive an accession, and valuable lives and property be saved to their possessors.

We know that the metallic part of clay is alumina, and that good sand is silica—that when these are brought to an incandescent heat they fuse,—that when so fused they vitrify, and when vitrified are impenetrable to water and air, and are incom-bustible. Why, then, should we not do away with shingles, and siding, and lathing, and adopt what is so safe, durable and cheap? I have never seen a brick burned larger than about 12 inches square, and the reason given is, that they cannot be dried of larger dimensions because they crack in drying, and that they can not be dried larger. This I know to be fallacious, for I have tried it, and altho' the process is rather peculiar, it can be done with facility. When dried as much as the sun will do

* We prefer publishing the letter of friend LYMAN, instead of forwarding by mail.—En.

it, they can be handled and placed in a furnace; and then the skillful operator can bake them as well as he can bake the large platters, without warping, or turning them as well as he can bake brick. This, then, is what I propose, that, instead of covering a roof with water lime or any other unmanufactured article, find good clay, destitute of lime pebbles, and good sand as near like flint as practicable; mix them well in proper proportion to form good brick; mould them in such shape, and size, and thickness, as you please, and if you require a smooth surface, strike them with the necessary care; if you desire a marble or variegated face, introduce the necessary coloring substance into the plastic mass, and if they are to be fastened to wood, leave holes for screws; then dry them—(which you will find the most difficult task unless you are fortunate enough to do it right.) When dry enough to handle, (which, for a mass of three-fourths of an inch thick, will be in one or two good days,) you can remove them to a furnace which should be built to fit the length of article manufactured; then the skillful operator will complete the job. When burned as hard as you desire, they will be carbonized, particularly if brought to a high or incandescent temperature. They may then be placed flat upon a roof or side, inside or out, and fastened with screws, and if they do not fit exactly the surface against which you place them, a little common mortar under will supply all deficiencies. When laying them they should be brought to one-fourth or half an inch of each other, and this space filled with a good cement, or lime, or putty.

Innumerable are the uses to which the highly carbonized clay could be made susceptible, for, "as the clay in hands of the potter," the sidewalk, the wharf, the gutter, the arch and the pavement, the floor of buildings, &c., &c.

I shall be very happy to hear from you, Mr. P. H., and I wish you would be good enough to start all the objections you can think of to my plan, and direct to

WM. LYMAN.

Moscow, Livingston Co., N. Y.

PUBLIC ROADS.

HOW SHOULD THEY BE FORMED?

In traveling over and examining the highways in the town in which I reside I find that a large portion (perhaps nine-tenths) of the roads are so constructed that in time of a freshet the surface water runs into the center of the road. I lately saw a path-master drawing gravel on to the center of the highway, on a gravelly declivity to cover over the stones washed bare by the Spring rains, and the road so formed as to concentrate the water into the wagon track. I inquired of him why he did not raise the center or turnpike the road. His answer was that "it had already been turnpiked." "But the ditches are all filled up," said I, "and want opening again, and the gravel you are drawing on will only make it worse." "Why so?" said he. I answered—"The first heavy rain that comes will wash away all the loam, sand and fine gravel, and leave the coarse stones, only to injure the horses feet and afflict the passengers who wish to drive fast down this declivity."

I mention this case not because it is so isolated one, but because it is common practice in the country towns. Not that I would say our country people are too ignorant to work roads, but they do not consider what they are doing, and so more than half of the road assessments are worked out in such a way that no good results from the labor—whereas, on a gravelly soil, like Monroe county, it is seldom actually necessary to gravel a road only to keep the ditches open and the road bed raised in the center to shed off the water.

A. H.

BEEES, BEE-HIVES, &c.—BRIEFLY.

EDS. RURAL:—In your paper of April 30, Mr. W. G. RICHIEY inquires about bee-hives, the apiary, &c. I have kept bees a number of years, and had as high as 70 swarms at a time. I do not like a bee-house on any plan. It is too much a harbor for ants and other insects. The best way, in my opinion, is to put four posts in the ground, lay on a plank, set on your hives, and cover with boards. If you have many hives, scatter them around; they do better than to have them all in one place. The best hive is the old fashioned square hive, with two drawers in top, six inches square by fourteen inches long.

As for SYLVANUS DAVIS'S bee-hive and bee-feed, they are perfect humbugs; neither are worth using. If you think a recipe for making the feed worth publishing, for the sake of exposing the humbug, I will send it to you.

Five years ago I had forty-five swarms of bees and in two winters they all died, leaving plenty of honey. They did not freeze, nor did the miller kill them. Can you or any of your readers tell the cause?

B. S.

Wesleyville, Erie Co., Pa., 1859.

NEW WHEAT.—A small lot of new wheat was offered for sale at St. Louis on Monday, the 30th of May, and brought \$5 per bushel. It was *May wheat*, and was grown by Dr. DICKERLY, of De Soto county, Mississippi. The same gentleman exhibited the earliest wheat at St. Louis the two past years, also—in 1858, the 5th of June, and 1857 the 26th of June.

CHINA TEA WHEAT.—In regard to the inquiry in a late RURAL, whether any one had ever known this variety of wheat to be injured by the midge, Mr. M. D. CORVELL, of Pulney, Steuben Co., writes—"I sowed five bushels last year (the 24th and 25th days of March) on dry, gravelly ground. The straw was as large as it could be and stand, and some of it did not stand. I had about 60 dozen large sheaves, and 80 bushels of wheat, machine measured; after it was cleaned through a fanning mill, there was about 20 bushels. The midge or weevil almost destroyed it. (By the way, is there any difference between the midge and weevil?—these were a small, yellow, or reddish worm, about an eighth of an inch long, and from one to twelve or more in each head.) There were but few heads but what had more or less of them in—and a strip about six feet in width, all around the field, did not contain wheat enough to put in tea."

* Yes, there is a difference. *Wheat midge* is the correct name of the insect you mention.

THE GENEECK CO. AG. SOCIETY'S second annual Horse Show is to be held at Batavia on the 4th of July.

Rural Spirit of the Press.

Sheep Shearing.

When should it be done?—The common answer to this question is: "When the oil has been oiled after washing, so that the wool has its greasy look and feel, and the 'yolk' has begun to form near the root of the fibre. This is well—one other matter needs to be looked after, also. It is the growth of the new wool. Every year a new growth of wool commences from the skin of the sheep. This should be watched by the shepherd, and the shearing should be done just as the second growth begins to start. The shearer should cut as nearly as possible along the dividing line between the old and new. If the second year's growth is allowed to grow somewhat, before shearing, you take part of two year's wool in the same fleece.—This impairs the fibre, for at the point of union between the growths of the two years, the wool is weak. This lowers the price. Besides, if the shearing is long delayed, the fleeces for the next winter will be thinner, and the sheep more liable to sicken and die. On the other hand, if you shear before the second year's growth has started at all, some of this year's growth will be left at the outer extremity of the next year's fleece. This remnant of this year's fleece, will diminish the value of the next year's fleeces, for the reason mentioned above. We say, then, shear your sheep, if possible, when the new fleeces is just beginning to start.

PREPARATIONS FOR SHEARING.—Sweep off the barn floor, scatter a little straw over it, and nail over that a bit of coarse canvass, or old oil cloth. This will make a soft bed for the sheep to rest on during shearing, and it can be kept perfectly smooth and clean. If you use low benches to shear on, they should be prepared in a similar way. The place where the sheep lie during the process should, at least, be very clean and smooth, to avoid filth in the wool, or tearing it with a rough surface. Drive into the outside barn-yard, sheep enough to last the shearers half a day. Then drive a portion of these into a smaller enclosure, (a stable or part of the "bay,") near the barn floor. Strew the floor of this enclosure with clean straw, that the sheep may not become dirty, if they lie down.

CAUTIONS ABOUT PREPARING.—1. Wait till the dew is off, before shutting up the sheep, under cover. 2. Do not, if you can avoid it, confine a greater number of sheep at once than the shearers can shear in half a day. It does the sheep no good to be long shut up, and the shearing can be done more easily and neatly if the body of the sheep is full of food. 3. The above cautions are for dry weather. But if the weather should be wet, you must wait a few days, till it becomes clear, or keep the sheep under cover and feed them as best you can. For it should be always kept in mind, that shearing should not be done when the wool is wet. Sometimes in "catching" weather, sheep thus confined, can be let out to feed in a pasture near by, and driven under shelter again, if a shower should be coming up. 4. These facts, as well as the fatiguing nature of the work, will suggest the importance of employing as great a number of good hands as you can, and doing up the work as soon as possible. We would want "good hands," for a poor shearer wastes more than his wages, in haggling the wool and injuring the sheep.

MODE OF SHEARING.—Every shearer has his own way. We would not dictate to any. But the following is a good mode:—Place the sheep on his rump, with his back towards you, and his left side resting against your left leg and thigh. In this position the sheep may have "his jacket opened;" that is, the shearer will commence at the brisket, and shear down the belly on the right side; then shear the outside of both thighs; then up, on the left side of the belly to the brisket; and then both sides of the neck, with the head. This is "opening the jacket." The sheep is then laid upon his side, and the shearer commences at the rump, and shears thence towards the head. Then the sheep is turned over, and the other side is sheared in like manner. Great care should be taken in turning the sheep, to prevent his struggling and kicking the fleece to pieces. Prudence and gentleness are qualities that will pay here, as well as everywhere else. A few suggestions must close what we say now. Remove all straw, burs and other filth from the fleece, before beginning to shear. Also wipe the feet of the sheep, if they have dung on them. Keep the platform clear, by frequent sweepings.—Use no violence, and remember with pity the fears of a dumb animal. Shear close and even, and be very careful not to cut the wool twice, which is often done by unskillful or careless shearers. Do not cut the skin of the sheep, or prick it with the point of the shears. When the operation is done, see that all tags and stray locks are cut off, from legs, tail, belly, and every other part. Leaving such tags is very slovenly, and gives protection to the ticks.—*Ohio Farmer.*

Salt for Stock.

The Boston Cultivator, of the 21st inst., has the following from one of its contributors:—"There are many farmers that seem to know little of the value of salt for stock; many give their cattle none at all, while others give it to them at stated intervals, say once a week or fortnight, and the cattle not having had salt for so long a time, sometimes eat too much, which does more harm than good. I have a trough fixed under a shed, so as not to be exposed to rain, and in a convenient place, where the cattle can visit it at pleasure; and in this trough I keep Rock Island coarse salt constantly, putting in half a bushel at a time, and as soon as the cattle have eaten that, I replenish it, and following this plan, the cattle will eat what they need, no more. My cattle are generally very healthy and free from most of the diseases that trouble stock at this season of the year, and I very seldom, if ever, have known them to have any kind of vermin on them. Salt is equally good for horses, and if you would have your horses strong and healthy, always keep salt in their mangers, and you need have no fears of their eating too much if you keep it where they can get at it when they choose. Many cattle, when first turned upon grass in the spring, suffer much from sores of some kind, but by following this plan, that difficulty will be entirely obviated—at least, this has been my experience."

Agricultural Miscellany.

WEATHER, CROPS, &c.—Since our last issue the weather has been remarkably cool—say, cold—for the season, with a severe frost on Saturday night (as reported on next page). Fires and overcoats were in demand on Friday, Saturday and Sunday, but the temperature is now (Tuesday 7th), becoming reasonable. We trust the accounts of damage by frost are exaggerated—though we fear the injury is material in some localities, as a letter just received from R. B. WARREN, Alabama, Genesee Co., says: "The frost entirely destroyed the Grape crop, and injured pears, plums, cherries and apples very much. I estimate my own loss at not less than \$100 on a single acre. I fear that wheat and rye are also injured."

—Our accounts of the growing field crops continue favorable, indicating an abundant yield in every section of the country. We do not remember a season during the past ten years, when the prospect was so encouraging for the farmer and planter, nor one in which they expressed such general confidence of a successful and profitable result.

A HINT ABOUT HORSES.—(To Officers of Ag. Societies.)—Large premiums are offered for "style and speed" at Ag. Fairs and Horse Shows—the speed meaning, of course, fast trotting. This may be well enough in sections where road and carriage horses are bred and in demand, but we submit whether other requisites than those understood by the term "style and speed," are not essential to make a good horse. Among these, we suggest that *fast walking* is an important item, and worthy of encouragement. A horse which can walk four to five miles an hour is certainly far more desirable and valuable than one that can only walk two to three. Why not offer premiums for the *fastest walkers*, as well as for the best trotters?

VETERINARY COLLEGE OF PHILADELPHIA.—We are in receipt of a pamphlet entitled "The First Annual Announcement of the Veterinary College of Philadelphia." It contains the Act of Incorporation, (passed in 1853,) with lists of Officers, Faculty, &c. The College, as is announced, "will be put into operation the present year at Philadelphia, where it will be permanently located." The regular Lectures of the course commence on the first Monday in November, and continue daily for sixteen consecutive weeks. The lecturers embrace the several departments of Veterinary Medical Science, as taught in the regular Veterinary Institutions of Europe. It is stated that "the Museum of the College already embraces a collection of Pathological specimens, in point of excellence far surpassing those of many European Veterinary Colleges of many years standing." Full particulars may be obtained by addressing R. JENNINGS, V. S., Dean, Philadelphia, Pa.

THE AMERICAN HERD BOOK.—Containing Pedigrees of Short-horn Cattle, with Introductory Notes by Lewis F. ALLEN—Vol. IV. We are indebted to the author for a copy of this work. It is a handsome 8vo. volume of 608 pages, and comprises nearly three thousand pedigrees, (1,108 of which are of bulls,) and many dog portraits, mostly drawn by PAGE, and well engraved and printed. The volume will of course command the attention and patronage of Short-horn breeders, by whom it ought to be largely appreciated. The price is \$3, if sent by express—\$5 50 by mail. Address LEWIS F. ALLEN, Back Rock, N. Y.

TRIAL OF PLOWS.—The Maine State Ag. Society announces a thorough Trial of Plows, to be made under its auspices at Augusta, commencing Sept. 18th, 1859. Medals will be awarded for the best plow for all work; sodb plow for stiff soils; and plow for light soils; plow for fallow; reversible plow; combined old and subsoil plow; subsoil plow; implement for deep and thorough pulverization of the soil, that shall successfully compete with the plow. The plows must make a furrow at least seven inches deep, and be adapted for all-work, for fallow, and for stiff and light soils. Competition open to all the world. Entries must be made with the Secretary, Dr. E. HOLMES, Augusta, Me., previous to the first of August.

THE DEATH OF REV. J. B. HAGGARTH, M. A., late Principal of the Royal Ag. College at Cirencester, England, is announced. The London Ag. Gazette says Mr. H. was appointed Principal about eight years ago, when the College had fallen into disrepute, and reopened it with only fifteen pupils, but in a few years the number increased to more than the institution could accommodate. It hence attributes the present high standing of the College to Mr. H.'s energetic and judicious management.

BOUGHTEN WHEAT.—A Canada friend asks if this early variety of Virginia wheat, noticed in the RURAL last autumn, can now be procured. We presume that it will be for sale before seedling time. Observing our notice of this wheat, Mr. HENRY WEAVER, of Gates, near this city, obtained and sowed a bushel of it last fall. It was fully headed out on the 23d of May—some days earlier than any other variety in this vicinity, we presume—and now looks fine, with a prospect of entirely escaping the midge. Time will tell, and we will report.

CHEAP SALT FOR MANURE.—Mr. V. W. SMITH, Sup't. of the Onondaga Salt Springs, Syracuse, announces to farmers and others desiring to make use of salt, by way of experiment, as a fertilizer, that salt of an inferior quality, (as valuable as any other, however, for agricultural purposes,) can now be obtained at the works in Syracuse, in any quantity equal to the probable demand, and at a very low figure. "It can be had for, say, 75 cents per barrel of five bushels, or for not to exceed 11 cents per bushel, shipped loose in boats. When wanted in any considerable amount, say twenty-five barrels or upwards, for agricultural or experimental objects, it will afford me great pleasure to attend to any orders for the same, gratuitously, so far as any personal services are concerned. I am one of those who believe in the value of salt as a top-dressing for grain and other crops, and feel as though I should be rendering a public service by facilitating any trials of its efficacy in that respect, within my power."

FEED FOR FATTENING.—A correspondent of the Mark Lane Express says that wheat boiled with a small quantity of roots will fatten cattle faster than the same value of best bruised oil-cake will do. Another has fattened pigs on wheat boiled with potatoes, and found them to "thrive most wonderfully." Lined cake is too high, compared with most other food for stock—an evil which farmers can readily remedy by refusing to buy it.

JACKSON CO. (MICH.) AG. SOCIETY.—The next Fair of this Society is to be held on the grounds, in Jackson, Sept. 27th to 30th—four days, in regular State Fair style. This Society ranks among the very best in the State, has the grounds and improvements, and is offered and managed by some of the most progressive farmers in Central Michigan.

GOOD LAMBS.—An Albany paper says Wm. VERNON, of Schaghticoke, last week sent to that city ten Colswold lambs only ten weeks old—that the average weight of each was 78 lbs., and that they sold for \$3 50 each.

HORTICULTURAL.

THE GARDEN.

On Saturday evening, June 4th, we were visited with a severe frost, doing much damage in the garden. The fruit, we think was sufficiently protected by foliage to prevent injury, but the tender shoots of the grape vines in many places are destroyed. Beans, melons, cucumbers and other tender things, are destroyed in many gardens, while in others, from some cause, they are uninjured. Where there was a free exposure to the wind the frost appeared to be less severe than in sheltered positions. The corn and potatoes are tipped in the tops, but not sufficiently to do permanent injury. By telegraph reports we see that the frost was even more severe in Northern Ohio, Buffalo, and in the Southern counties of this State. We fear further reports will be even more gloomy.

The THORNs are a very beautiful class of small trees, now, (June 8th,) in full flower, and deserve and receive general admiration. There are few trees or shrubs more worthy of general cultivation, and we would be glad to see them in every garden. The best varieties are the *Single Pink* and *Single Red*, and the *Double Red* and *Double White*.

Several varieties of the SPINEA are just gone out of flower, and we took notes of the *S. trilobata*, and *S. crenata*, both very neat shrubs of rather dwarfish habit, with trusses of small flowers almost covering the plant. *S. ulmifolia* is of larger growth, with larger flowers. *S. lanceolata* is the finest of the class—of the purest whiteness. Its branches are floral snow-wreaths. Everybody should plant it.

The CALYCANTHUS is becoming a great favorite, as the demand for it at the nurseries shows. There are several varieties, sweet scented shrubs, with large flowers of a cinnamon color.

The ROSE-COLORED WIGELIA is in full bloom. It is a magnificent shrub, when covered with its rosy flowers, blooms profusely, and is as hardy as a lilac. Plant it next fall or spring, by all means.

That old favorite, the SNOWBALL, is now a little past perfection. There is nothing better. Everybody has it, or should have it. It is a crooked, rambling grower, and the wood is tender; the consequence is, many plants are broken with the weight of the flowers, especially in wet weather. Young plants should be pruned, so as to secure a stiff stem and a compact head.

The HORSE CHESTNUTs are just passing out of bloom. The common variety, and the *Red Flowering* are fine. The flowers of the *Yellow* variety are poor, not differing much from the *Buckeye*. The *Double White*, an engraving of which we give, is the finest of them all. The flowers are white, prettily spotted with red, like the common variety, but perfectly double. There is a variegated-leaved variety, with red flowers, but it is not much discriminated.

Our notes on Herbaceous Plants in flower we must reserve until next week.

TREES AND FRUIT IN SOUTHERN ILLINOIS.

CHARLES KENNICOTT, the Horticultural Editor of the *Prairie Farmer*, writes as follows from Southern Illinois:

"The current spring has been a very singular one in Central and Southern Illinois, particularly characterized by frequent and high winds, unexpected and severe frosts, and rains long continued, but for the most part warm. Here, in Marion county, April did not afford us three really fine days, and May, so far, promises no better state of things. Very little farming has been done, for our farmers have learned from experience that it is worse than useless to disturb our heavy soils while saturated with water. This section of Egypt is again threatened with a short corn crop, for the usual planting season is at hand, and probably not one acre in ten has yet been plowed. But unfavorable as the season is for spring crops, it is grand for the newly planted orchards, and no portion of the West has set so many as Egypt, it being estimated in this county alone, that from \$50,000 to \$100,000 worth of trees have been set. Nor have our people confined their purchases to fruit trees alone; much has been done in the way of planting choice ornamental trees, shrubs and plants. Evergreens are especially popular, and most species and varieties seem to thrive admirably in our soil. Here the prospect of a fine fruit crop is beyond a doubt certain. Every little dwarf pear tree and most of the standards are loaded with fruit already as large as musket balls.

Two days since we spent a half day in visiting the fruit gardens of the young city of Centralia, a place that bids fair to rival even Boston in successful pear culture. We are personally pretty well acquainted with most of the cities and towns in the Northern and Central portions of the State, and we know of no place of the same age and size where so much attention has been paid to fruit culture, or so much taste displayed in the cultivation of flowers."

Mr. KENNICOTT is not only one of the most intelligent Horticulturalists of the West, but a Western Nurseryman, who can have no interest in speaking a good word for those in the same business at the East; and yet he takes occasion, for the sake of truth, to contradict some of the slanders so industriously circulated of late. We commend his remarks to the attention of our Western readers who are not afraid of truth, which it is our aim always to elicit.

"And here we would remark (in no spirit of malice either) that certain well-known Western establishments have furnished our farmers with trees, that any abused Rochester nurseryman would have been ashamed to send out. Indeed, candor compels every liberal planter to admit that a majority of the best trees in this section, especially pears, have come from Mount Hope and other Eastern nurseries."

DOUBLE FLOWERING HORSE CHESTNUT.

THE ALLEN RASPBERRY.

Messrs. Editors:—In the *Rural* of the 21st inst., Mr. QUINBY relates his last year's experience with the two varieties of fruit under this name. He is slightly mistaken as to the name. The "Allen" designates the best of them, as he supposes. The other, and poorer one, I call the "Red Prolific," as the gardener called it, for distinction, not knowing any name for it. Mr. QUINBY may be correct in relation to the two berries; but I submit to him whether one year's trial is a sufficient test of their comparative merits. He would do well to remember that *locality* has a great influence on the habits and character of different fruits, the small fruits in particular. With me the "Prolific" is every way equal to the "Allen" in size and flavor. The wood is more upright, and not at all "branching," and of a crimson-russet color. The fruit, too, is quite as bright, and as abundant on the stalk as the other. Several cultivators who have had large quantities of both kinds from me prefer the *Prolific* as the best bearer, and market fruit. It has so proved in Connecticut and New Jersey. Yet it may prove very different in the Mohawk Valley with Mr. QUINBY. There is nothing better settled in practical pomology than the fact that the same fruits do not equally succeed in different soils and localities, even under the same climate. Nor does the experience of one, two, or even five years, settle the question. Acclimation and adaptation to a new soil after a few years, may altogether change the character of a single fruit, and such fact every one should know before he condemns it on a year or two's trial.

I have never said, and never supposed, that either varieties of my raspberry would be equally or absolutely successful in all localities, soil and climates. Yet I know they both succeed well with me, and with many others who have had them from me, and so it is with other raspberries. The *Hudson River Antwerp* is wonderfully successful in some places, as in New Paltz, Hampton, and along the west shore of the Hudson, in Orange and Ulster counties in this State, and is the great market raspberry of New York city from those counties, although it requires winter covering to succeed. Yet in many other localities it is an entire failure. A plantation of an acre or more was made in this vicinity a few years since, in good soil, and it was well cultivated; but it proved an entire failure, and the canes were taken up, and thrown out. Other trials have been made hereabouts, but with no better success. For the last five years I have weekly passed a fine garden, with a considerable plantation of one of the highly esteemed varieties of garden raspberry in it, and after much pains-taking, and years of trial, they have been thrown out as nearly or quite worthless. I would advise Mr. QUINBY to hold on to his condemned raspberry a year or two longer, before he utterly repudiates it. Black Rock, May 30, 1859. L. F. ALLEN.

GRAPES, SUMMER AND WINTER.

"What a man sows that shall he also reap." This adage human experience every day verifies, and still, like all rules, it has its exceptions. If a man properly plants a grape vine and properly cultivates it, and gives it the necessary protection in winter, the fair presumption is, that in due time and in the proper season, he will reap grapes to his own health and pleasure, and to the gratification of his friends. Judging from my own experience and observation, I supposed that all whose good judgment had led them to become permanent readers and patrons of the *Rural* would have, ere this, not only succeeded in the Alpha, but also in the Omega of grape cultivation. But in this there also appears exceptions, and among them one of your contributors and readers, my friend, (as I trust all

your readers are,) G. M. REYNOLDS, of Michigan, who, when about to reach the goal of grapes in his experience—Jack Frost interfered and blighted his hopes. Now I would advise my friend not to give it up so, but persevere; and if he will take a little advice, and do works meet for success, he will yet have grapes enough and to spare—for I speak as one having been through the mill—having had my own vines, some years since, frozen down—and yet, I never thought for a moment of abandoning my nice sheltered southern exposure for a bleaker one. Having a natural appetite for the best grapes and a plenty of them, and still have the pleasure to supply my table (May 10,) with grapes in good preservation. The next year succeeding my misfortune I reasoned upon the subject, and then mixing faith and works checked the growth of my vines, by taking the ends off two or three times during the season, and when winter approached about the first of December trimmed my vines according to "Holmes," took them from the trellis and laid them on the ground, with a block of wood next above to keep them quiet. Then scattered refuse straw or some other similar substance on them, (not enough to shelter mice,) but sufficient to catch the snow and keep their temperature uniform, and in so doing have found the care and labor a cheap insurance, and the vines well protected. S. N. HOLMES. Syracuse, N. Y., 1859.

PREVENTING THE MAGGOT IN THE ONION.

Messrs. Eds.—Having seen numerous inquiries in the *Rural* to prevent maggots in the onion, I send, for the benefit of those interested, what I suppose to be a remedy, in part. I have not tried it, but intend to in a few days, being in the gardening business, and having suffered a good deal from the maggot. One day last fall being in market, (Potsdam Village,) I met with Mr. SALMON CORNELL, quite an extensive seed grower of Potsdam, and in conversation with him, found he had good success in growing onions. He told me how it was done, and I have concluded to try it myself and give others an opportunity. But to the remedy.

The maggot is the work of a fly. After the onions are up and the weather is warm, the fly appears and does the mischief. Go to the crockery store, get the cheapest bowls you can, enough to set one on every eight or ten feet square; fill them about two-thirds full of sweetened water, quite sweet. Then take small pieces of boards, make three holes in them, the same as a milking stool, make the legs sharp at the lower ends, and set the stools over the bowls to keep the storms out, and press the legs into the ground to prevent the wind from blowing them over. Do this and you will catch flies at such a rate that you will have to empty your bowls and fill them with sweetening several times. The flies like it better than onions. Mr. C. told me he caught millions on a bed where he raised a hundred bushels. You may think this quite a process to go through with, but I hope Ruralists will try it and report their success next fall. G. R. CRANDALL. East Pierpont, St. Lawrence Co., N. Y., 1859.

SUSQUEHANNA AND CHEMUNG VALLEY HORTICULTURAL SOCIETY.—The next Exhibition of this Society is to be held at Elmira, June 22d and 23d. We are told there is every prospect of a successful show. The various Committees have been appointed, and all the necessary preliminary arrangements made for carrying out the Exhibition. The *Elmira Gazette* says, "in accordance with a time honored custom of the Society, the Committee on Wines is composed exclusively of Editors. We hope, therefore, that the exhibition of that article will be made a leading object in the minds of the Managers, and that in fixing their premiums, reference will be had to the quantity as well as quality."

ABOUT STRAWBERRIES.

FRIEND MOORE:—For two years I have been trying to renovate a bed of Strawberries, which was overrun with grass and weeds when it came into my possession. I have spent time and labor enough on it to have cultivated an acre of corn a season through, and it is only about two rods square. The varieties were *Hovey's* and the *Early Scarlet*. Though we succeeded in getting a few fine berries, we had nothing like a supply for the table. Reading such marvellous stories in the public prints "about strawberries," and especially *Wilson's Albany* and *Parody's Seedlings*. I procured a dozen plants of each last Spring. The *Parody's Seedling* did not have a fair chance, being overrun by a squash vine, the seed of which, an amateur farmer sent me, with a rich name and a great recommendation, which turned out, however, to be a common pumpkin and a great nuisance, as it damaged my strawberry plants materially. But this dozen was increased to about 100 good plants now in bearing. The *Wilson's*—the most hardy—the most prolific, the best and most perfect berry, all things considered, has gone far beyond the marvellous. From the dozen small plants set last spring, we had perhaps a pint of good berries, not one of which would have been suffered to mature, had I been as well as posted then as now in their culture.

These plants, though permitted to bear fruit the first season, gave me an incredible number of fine healthy young plants, or runners as they are commonly termed. I commenced removing them the latter part of July, to a patch of sweet corn, near by, which I followed up till the new strawberry bed was filled with sets, (5 rows, 100 in each row). These plants expanded their roots after the removal of the corn, as well as before; so that these very plants, not yet a year old, promise a bountiful supply of berries, some at this moment, (80th of May) are over two inches in circumference. The largest berries are on the young plants. At a safe estimate, the 12 old plants will average 100 berries each, and the young plants 50 each. One dozen plants of this variety as a beginning, will give an increase of 1000 the first season, with ordinary attention in a good soil, so that in the fall of the next season after planting the first dozen, a person may set his acres if he wishes, or supply all his neighbors with enough for a garden bed.

It is proper here to remark that I commenced setting the new plants rather too soon, if the object is to obtain the greatest increase of plants; but the earlier the young plant can be severed and removed from the parent with safety, the better, and better will be the prospect of a large number of large berries, the following season. Several of the younglings that were first removed, threw out runners, and gave four or five good plants each; these were taken up this spring to supply orders by mail.

It will be recollected by many of the readers of the *Rural*, that Mr. PARODY, of Ga., obtained \$5.00 per dozen for his plants, the first sent out by mail. No such effort was made by Mr. WILSON to introduce his strawberry; in fact it has been left almost to introduce itself, which it is abundantly capable of doing. Two or three cents per plant is about the highest figure that nurserymen have demanded for them, in small quantities of 100 or less. They can be sent to any accessible point in the United States by mail with safety, if properly packed, and for 50 to 60 cents per dozen, including postage, for any distance under 3000 miles. No man having half an acre of ground, need be without this cheap luxury. Early in the spring is the time to send by mail, as the plants then are in the dormant state. In August they will bear transportation no great distance without being boxed in moist earth. This may be done and sent by express, but spring time is the safest.

Macedon Centre, N. Y. I. W. BRIGGS.

REMARKS.—If Mr. BRIGGS' old beds which he tried to renovate, had been the *Wilson* instead of *Hovey's Seedling* and *Early Scarlet*, the result would have been the same. We think a good deal of the *Wilson*, but it is not fair to contrast a new and vigorous bed of this variety, with an old and worn-out bed of *Hovey*. When the *Hovey* was first shown here, they were monstrous in size, sometimes measuring six inches in circumference, and the beds were productive. In a few years the *Hovey* grown in this section were not much larger than *Early Scarlet*, and cultivators began to say they were unproductive—all because the beds were old and neglected. And so it will be with the *Wilson* in a few years. Every new sort is praised and taken care of for a few years, then it is neglected and condemned.

Inquiries and Answers.

INSECTS.—Inclosed please find evidences of the ravages of a certain worm which infests my apple orchard. You will perceive on the stem I send you, the egg or deposit of the same. They come in droves and strip the tree of its verdure in a very short time. About two-thirds of my orchard is infested in this way. When the apple is formed, they eat through to the core. Can you, or the writers of the *Rural*, give any account of this worm, and the remedies to be used to get rid of the same? Please give me some information through the columns of the *Rural*. The worm when full grown is from one-half to three-fourths of an inch in length, a very supple measure worm of dark color. I am fearful they will kill my apple trees. I ask for information for the purpose of putting a stop to their ravages.—WILLIAM KINNE, *Romulus*, N. Y., 1859.

The leaf we found inclosed seems to have suffered from the ravages of the *Apple Tree Caterpillar*, but the piece of branch is covered with the *Apple Bark Louse*, which we described, in answer to a correspondent in the *Rural* a few weeks since, giving the best known remedies.

RASPBERRIES.—Will you, or some of your many thousands of readers, please inform me whether or not raspberries might be cultivated on ground now occupied by a young apple orchard, just planted? and whether it would be any disadvantage to the growth and health of the trees or not? The trees are forty feet apart.—A YOUNG FARMER, *Tyler Co., Va.*, 1859.

A few rows of raspberries between each row of apple trees might be grown to advantage for several years and without injury to the trees. Only give all good, thorough, clean culture.

TO MAKE HARD SOAP, COOKIES, &c.

HARD SOAP.—Noticing an inquiry in your last paper how to make hard soap, I send you a recipe. Take a pail full of good soft soap, let it boil, add 1 pint salt, stir it till well mixed, and set away till cold. Then drain out the lye, which will be at the bottom, boil the soap again, add half as much salt, let it cool, drain off the lye as before, repeat the process a third time with a handful of salt. When cooled, take off the soap, melt it, perfume with what you choose; run in moulds, set away in a cool, dry place, and in a few days it will be fit for use.

COOKIES.—One cup of butter, 2 of sugar, $\frac{1}{2}$ cup of butter-milk or sour milk, 4 eggs, tea spoon soda, flour to make it a proper stiffness, knead a good deal; bake 15 minutes. When cold put them in a tin or stone jar, cover tight, and they will keep six months as nice as when just baked.

CHEAP GINGERBREAD.—One pint molasses, 1 tea-spoon sour milk, 4 tablespoons shortening, tea-spoon soda or saleratus, 3 tablespoons ginger, flour till you can roll it.

BOILED PUDDING.—One pint good butter milk, 1 pint sweet milk, 1 egg, 1 tea-spoon salt, 1 cup fruit, 1 tea-spoon soda. Thicken to a stiff batter, boil 4 hours, serve with butter and maple honey.

Springfield, Erie Co., Pa., 1859. AMANDA.

FROM A ROCHESTER LADY IN MINNESOTA.

Excuse me, Dear *Rural*, for my presumption, but I think it may be of some benefit to your fair readers to know how to make a good *Minnesota Peach Pie*, so here it is:

MINNESOTA PEACH PIE.—Prepare a rich crust, line your tin, then slice (very thin) tomatoes! that have just begun to turn, lay them evenly upon your crust, cover with sugar, and spice to your taste. I prefer lemon peel grated on, or cinnamon. Dissolve a small piece of tartaric acid in a little water, to improve the taste, cover with "a network crust," and if you do not pronounce it most delicious, then please tell me. Bake half an hour.

MINNESOTA PRESERVES.—Take good full grown tomatoes, just before they begin to turn, slice in three pieces, (discarding the ends;) prepare your syrup the same as for other fruit, (pound for pound,) let it come to a boil, drop in the fruit, simmer till clear, season with lemon; then remove your fruit, boil down the syrup to the consistency of molasses, and when cold pour over the fruit. This mode of preserving tomatoes has been pronounced superior to any other, by those who know what is good.—As it is my way, you can publish it if you choose.—Mrs. V. R. G., *Lakeland, Wash. Co., Min.*

BAKER'S GINGERBREAD, &c.

Eds. *Rural*:—Noticing an inquiry in your valuable paper for making baker's gingerbread, I thought I would send mine; also a recipe for cookies without eggs:

BAKER'S GINGERBREAD.—Two cups of molasses, and 4 tablespoonsful of butter stirred together without melting; then add 1 cup of flour; 3 table-spoonsful of soda dissolved in 1 cup of milk; 2 tea-spoonsful of alum dissolved in $\frac{1}{2}$ cup of boiling water, and one table-spoonful of ginger. Stir all well together, adding flour gradually. Roll thin, cut into cards and bake quick.

COOKIES.—Two cups of sugar; $\frac{1}{2}$ cup of butter; 1 cup of thin cream, a tea-spoonful of soda. Plenty of seeds.—A YOUNG HOUSEKEEPER, *Herkimer, N. Y.*

DRY, MEALY POTATOES.—In one of the late *Rurals*, Mrs. M. A. RICE, of Howe, Franklin Co., Mass., gives the following method to secure dry, mealy potatoes:—"They should be dropped into boiling water, and be kept boiling swiftly until done. Pour off the water and set the kettle on the stove. Partially remove the cover for the steam to escape. The sooner they are eaten the better they are." But, at this season of the year, when potatoes are withered, I think she will often fail of having mealy potatoes, unless she pares them and soaks them in cold water three or four hours, or when it is convenient over night, before boiling. At least this is my experience.—SARA, *Pembroke, N. Y.*, 1859.

PIE PLANT AND GOOSEBERRY PIES.—As this is my first summer's experience at keeping house, if any of your kind lady friends will give recipes for making *Pie Plant*, *Green Gooseberry* or *Currant Pies*, they will confer a great favor upon.—QUINN, *East Putney, Wayne Co., N. Y.*

COCOA NUT PIE.—A friend of mine desires me to ask of your numerous readers, a recipe for *Cocoa Nut Pie*. If rightly made it is said to be delicious.—M. L. P., *Lyndonville, N. Y.*, 1859.

HOW TO PACK EGGS.

The following directions are given, by one who has had a good deal of egg packing to do, as the best method:—"Always use clean oats. First put them one inch deep in the bottom of the barrel; then a pretty firm sheet of paper; then a half-inch of oats again, well pressed; then eggs, end up, followed by oats and eggs as before, but working each layer of oats with the hand snugly down around the eggs next the barrel, as well as rubbing them effectually in between each of the eggs in the layer. I use a board some six or eight inches square, with a loop or staple in the center, for pressing each layer of oats firmly down. There will be something gained by lifting and dropping the barrel square on the end, but not by shaking, as it disturbs the layers. When it gets too heavy to lift, use a board three-fourths as large as the head, and get on it, increasing your weight with a spring. End as you began, with paper and oats, getting on the head and driving it in. The secret lies all in packing the oats. Oats are better worth sending to market than hay, and just as safe. I have sent ten barrels at a time without losing a single egg. You must pack tight. Remember that."

WHO LOVETH BEST?

BY AUGUSTA MOORE.

Man hath a sturdy and heroic soul;
He can go forth to war and victory,
Can master terrors, can smother sighs and groans,
And without terror as a martyr die.

Yet woman hath a stronger heart than man,
And woman's love more tender is and true;
Finer her faith, quicker her sympathy,
And more for Jesus will she dare and do.

All through his mournful pilgrimage below
She was his tender, ever-faithful friend;
Man's folk love oft wrong his soul with woe,
But woman loved him steadfast to the end.

(Ladies' Repository.)

Written for Moore's Rural New-Yorker.

Plain Talks to American Women.--No. 12.

BY MRS. M. P. A. CROZIER.

We have alluded in the foregoing number, to one method of instruction adapted to infancy. It has come to be a well-settled opinion that children's minds should not be precociously developed; that until the constitution is well established, it is physically injurious to urge them rapidly forward. And where sufficient opportunity for mental culture is enjoyed later in life, a few years delay in early childhood in undertaking the study of books, is found to be no obstacle to ultimate success. Indeed, it is even advantageous, for the vital energies become so strengthened, that the brain may afterwards work more steadily and intensely, and thus the mind make more rapid advancement.

It is very pleasant to mothers to know that their children are "smart," and gratifying to their pride to have their infant minds crammed with knowledge, but when this is gained, as it most likely will be if the result of application to letters, at the expense of physical deterioration, and of future imbecility, it should be a source rather of sorrow than of pleasure.

Rather send the child of three or four years out into the sunshine, to study the brooks, the pebbles, the flowers, the trees, and the birds,—to chase the butterflies over the walks, and play at hide-and-seek among the shrubbery of the lawn, than keep him in the house upon a chair at your side to learn the strange characters of the alphabet, and combine them into those unmeaning syllables, so often the first succeeding lessons, called a-b-a-b-s. He will learn more from the book of Nature,—learn it with greater delight, and with less injury to his system, in one week, if allowed the former course, than in a month if confined to the latter. The latter course is unnatural. Childhood loves to be free. The fresh breezes and playful exercise, which, if unrestrained, it will be sure to enjoy, paint the roses of health upon the cheeks, and pour into the soul a full stream of gladness.

The sentiment that education consists simply in the acquirement of knowledge, so extensively prevails, that many poor babes of three or four years are sent to spend several hours of the delightful days of summer, and even the short, cold days of winter, in some uninviting place dignified by the name of school-room, and the exasperating tortures which they there often undergo, are known only to the experienced. How the bones ache, with sitting upon the hard benches! How the tongue aches to speak, and the limbs for a run upon the green turf, or upon the snow banks! How the eyes ache with gazing at the blinding letters! How does the heart often ache for the love of home, all unaccustomed as it is to the coldness, the repulsiveness, the unkindness, which it sometimes meets with from one who has assumed the place of teacher. What compare can the advantage gained by the memorizing of a few letters, or even a thus early power to read monotonously simple sentences, when acquired under such circumstances, bear to that derived from the boisterous, happy freedom of a natural childhood?

Oh, mothers, if you love your babes, don't send them to the school-room as soon as they can walk, to have their brows marked with lines of care, their dispositions soured and rendered melancholy, their cheeks pale by confinement, and their minds contaminated by evil associations! Keep them with you till they are six or seven years old at least.—Gratify their curiosity, and feed their minds as suggested in the last number, but make not such instruction a task! If you have leisure—and if a mother should have leisure for anything, should it not be for the training of her children?—be their daily companion in little pleasure excursions. Go with them into the field, and show them how hay is made, how wheat is harvested, how the corn and the potatoes grow; go with them into the forest, and point out the various species of birds, and their methods of nest-building; the different varieties of trees and their peculiarities; gather with them wild flowers for the pitcher on the mantel, and the vase on the parlor table; go with them to the lake shore, and the river's side, and study fishes, and shells, and pebbles, tell them stories as you go, beautiful stories, such as children love to hear.—Will not your children love you for such a course? Will they not learn to prefer your society to any other, and to love a home whose guardian angel bestows such blessings?

And when you come to give your little ones an introduction to the mysteries of "book-learning," let the instruction still be given in such a manner that there shall be found in it nothing repulsive. Having beforehand awakened an interest, a desire for the attainment, by a representation of the increased happiness which it will bring, seize upon the most propitious moment to commence the work.

Attempt but little at a time. Give your little daughter, for instance, a few letter blocks or cards with which to adorn her play-house. Let her hang them up for pictures. Select such letters as will form a familiar word. Acquaint her with their

names, and let her play teach them to her doll.—When you are sure she knows them all, place them together, and tell her what they spell. Perhaps the word is "Ma." That would be a very interesting word for an affectionate child to commence with. How her eyes will brighten when you tell her that the letters she has been playing teach with dolly, spell "Ma!" Talk with her then about loving Ma, and trying to please her; let her name the letters a few times in the order in which they occur in this word, then place them together in her play-house again for a large picture, and will she ever forget them?

Various similar expedients can the ingenious mother adopt to teach the alphabet, and the reading and spelling of simple, common words, and no others should be taught for some time. When a little skill in the new art is acquired, cards with short words combined into sentences expressing some moral sentiment, Bible precept, or pleasant truth, may be hung up in the nursery, and the ingenuity of the child exercised in ascertaining what it is; but he should not be allowed to become in the least discouraged. Help him just at the point where help is needed, but not before. A triumph in such an undertaking will be a stimulus to succeeding endeavors.

In teaching children to read, be sure that they acquire from the commencement, the habit of reading naturally; that they adopt, and continue, so far as possible, the conversational style. Insist, from the first, upon correct pronunciation; give them nothing to read which they are incapable of understanding, and be certain that they do understand it, before a new lesson is given. It would be well that the import of every lesson should be fully comprehended from the explanations of teacher, before being read. Afterwards there should be close questioning, and the child allowed and encouraged to repeat its substance in his own language. This will cultivate a facility for the expression of ideas, and if sufficient care is taken, greatly increase the pupil's knowledge of the construction and use of language.

When you have taught your child to read, you have placed in its hands a most efficient means of mental and moral culture. You have, as it were, given him a lever with which to pry into the mysteries of Nature, and draw from her secret storehouses rich and rare gems. But you have afforded it a means, which, if perverted, may become instrumental in its destruction. Let a taste for reading be cultivated, but by all means, let it be a taste for pure and noble reading! The mother should know what is the mental aliment which is offered to her young children. Nothing of an immoral tendency should be tolerated for an instant. The stream of pollution once having opened a crevasse into the mind of childhood, spreads with a rapid, wild and fearful course, destroying the fair gardens of truth, and the pleasant fields of wisdom, as only error can destroy.

And what is given the child to read, should be simple—not puerile and trifling, but noble truth simply expressed, and in an entertaining manner. Do not create a disgust for literature, by placing in its hands learned disquisitions which it cannot digest, dry treatises, which being incomprehensible, are therefore uninteresting. Children love stories, and are easily influenced by them—it is natural. The impressions conveyed to their minds by a representation of scenes which might have occurred, or which have occurred in actual life, are in general more vivid than the mere relation of abstract truth. Tell a child that "Honesty is the best policy," that falsehood brings disgrace, and how indistinct will be the impression, compared with that which will be received by tracing out the effects of these causes in a well-written story. The latter will be felt; it will be engraven upon the mind as pictures are engraven upon copper-plate, and remain there ready to be transferred at pleasure to some blank page in the intellect of another. We would not encourage an exclusive attention to this kind of reading, but it may be permitted as spice to more solid food.

Blessings upon PETER PARLEY who has written so much and so beautifully for children! No estimate can be made of the influence of "Goodman's brain" upon the youth of our country. May his mantle, when dropped from his shoulders, fall gracefully upon those of some apostle of Nature, and lover of children, who shall open for them another casket of diamonds, equally brilliant, and equally valuable!

One of the best little libraries for children with which we are acquainted, is the series of "Rollo Books." Finely illustrating many of the principles of Natural Philosophy, there is conveyed besides a fund of other knowledge, in a manner so agreeable as almost surely to secure attention, and become stamped upon the mind. Parents, buy such books for your rising families. If you give them not in your own homes that which will interest their mentality, they will be impatient to seek it elsewhere. Give them access to newspapers, magazines and new books. Retrench as you may your expenses in other directions, keep up, if possible, a full supply of entertaining literature. If you are unable to purchase, encourage the free use of public libraries.

What a vast difference there is between a reading family, and one in which is cultivated no taste for such employment! What a difference in intelligence, in refinement and domestic happiness! And what a difference in the ultimate usefulness of the members! See the father and children of one spending the long winter evenings whittling over the stove, or playing at fox-and-geese, dominoes or checkers, and relating the floating gossip of the neighborhood, while the mother, with her knitting, meditates perhaps upon the cares of the day, and those of the morrow, or joins in the relation of the news, by telling what Mrs. So and So says Mrs. No. Two says Mrs. "They Say" says of somebody else. See the different members of the other gathered around the fireside, each one with some individual intellectual employment, which lights up their faces with joy, or all enjoying a social mental repast, by the reading aloud of some member of the family, which is frequently and pleasantly diversified with questions, explanations and remarks! How swiftly the hours fly away! All too soon comes the signal for retiring. Each gathering of this kind adds a new link to the bond of family union, and when those youth who have thus associated beneath the "roof-tree" of home, go forth to the world, will it not be to build up the various societies where their lots may be cast, to radiate the beams of intelligence and domestic love into the bosoms of other families, and give a new impetus to the onward-moving car of Science?

WHY I LOVE HER.

For her dark bright eyes of brown,
For their lashes drooping down,
For the bloom upon her cheeks,
For the gentle words she speaks,
I love her.

For her hand of parian hue,
For her red lips moist as dew,
For her waist so taper-neat,
For her tiny little feet,
I love her.

For her dazzling pearly teeth,
For the dimpled chin beneath,
For her carriage free and light,
For her shoulders snowy white,
I love her.

For her brow so purely fair,
For the truth that's written there,
For her heart so true and kind,
For her pure and noble mind,
I love her.

For the love-light in her "ee,"
For the pledge she gave to me,
For the words "forever thine,"
For the kiss her lips gave mine,
I love her.

MEMORIES OF A SABBATH.

It was the Sabbath day; not the calm, quiet Sabbath of May or June, but a stormy, blustering one in November. The rain had descended in torrents since morning, and the winds whistled through the bare branches of the trees that surrounded a little church in a quiet country village.

But though the storm-king raged in all his fury, even the aisles and galleries of that house of God were crowded, for on that afternoon some of the noblest sons and fairest daughters of our village were to receive the holy ordinance of baptism.

The gray-haired minister had descended, the group of young men and maidens had gathered round the altar; the baptismal vows had solemnly been spoken, and the angels had swiftly borne them to the ear of Him, to whom those youthful ones had consecrated their lives.

All hearts were uplifted in silent prayer that they might always be led by the Good Shepherd "into green valleys and beside still waters;" and that when they walked through the "valley of the shadow of death," they might "fear no evil," but have the rod and staff of the Almighty to lean upon. All was silence, when suddenly the door opened, and a stranger, with a sad countenance entered. Advancing to the altar, he whispered a few words to our pastor, and then withdrew. The people gazed wonderingly on the man of God, until he arose, and with tear-filled eyes said, "My children, your former pastor, HOWARD PHILLIPS, is dead. The Lord gave, and the Lord hath taken away; blessed be the name of the Lord."

Old men and women, young men and maidens, and even gentle childhood, bowed their heads beneath this great grief; and a low wail from all hearts ascended as they murmured, "The Lord gave, and the Lord hath taken away," but blessed be the name of the Lord was too great a trial for their faith to utter, at this moment of sudden bereavement. Sob after sob testified how truly they had loved him, who but a few months since had left them to minister to a congregation in a neighboring village.

In the prime of manhood, with apparently as fair prospects of long life as any of us, we had seen him for the last time. And now he was numbered with the dead! Oh, it was too much for our bleeding hearts to say, "Thy will be done," for he had grown to manhood among us; had addressed his first discourse to the same congregation now assembled; rejoiced with us in prosperity, and in adversity had led us to the Saviour for consolation. We could not realize he had passed from earth, and forever.

Again, another scene. In the church over which he presided at the time of his death, was a much larger assembly than we first saw, for the two congregations were together mingling their tears over his coffin. The hymn, the prayer, made our hearts bleed afresh, for we could only think of the departed as dead; but when the words were announced, "To Him that overcometh will I grant to sit with me on my throne," then we received consolation, for we knew he had overcome, and we could look up with spirit-eyes and behold him with the Blessed One who spoke this precious promise.

And so they laid him to rest, quietly and peacefully, while we shut down the wailing of our hearts, murmuring, "It is well." Wildly the wind shrieks over his grave to-night, but his spirit is enjoying the rest of him that overcometh.

Verona, May, 1859.

WHAT A GOOD PERIODICAL MAY DO.—Show us an intelligent family of boys and girls, and we shall show you a family where newspapers and periodicals are plentiful. Nobody who has been without these silent private tutors, can know their educating power for good or evil. Have you never thought of the innumerable topics of discussion which they suggest at the breakfast table, the important public measures with which, thus early, our children become familiarly acquainted; great philanthropic questions of the day, to which unobtrusively, their attention is awakened, and the general spirit of intelligence which is evoked by these quiet visitors? Anything that makes home pleasant, cheerful and chatty, thins the haunts of vice, and the thousand and one avenues of temptation should certainly be regarded, when we consider its influence on the minds of the young, as a great moral and social blessing.—Emerson.

It is a caustic which sometimes burns the fingers of those who make use of it.

THE PLUCKED LILY.

Come with me to yon green churchyard. Kneel with me at this little tombstone. Spring flowers are, for the first time, hovering o'er this new made grave. Let us read the simple words inscribed on the pearly marble:

"ELLA!"
"Our Lovely Lily."

Yes, how lovely. Sweetest and most beautiful of flowers was the lily which bloomed in the garden of our hearts. We watched it when a tiny bud, leaning on its mother stalk. Ah! even then it shed a genial warmth on all around. We saw it as it unfolded its petals, innocently to our gaze. Watched it as nature moulded and perfected.—Beautiful! Beautiful! oft rose to our lips while still new charms were unfolded to our vision. Beautiful indeed, she was—not alone in personal charms; she possessed deeper, purer charms than these—heart, soul, spirit, buoyant with purity, love and beauty. She was an angel among us—a star to guide us on our dreary way. For fourteen summers did she bless our hearts, imparting a fragrance "all her own." For fourteen summers did we see her loving form, as in innocence and glee she bounded to our arms, presenting some choice plucked flower—pure emblem of herself.—But ah, she was too pure to breathe this tainted atmosphere. Her spirit longed for more congenial climes. Aye, methinks, even now I hear that sweet, eloquent voice, as, with soul-filled joy, she asked to go "home to Jesus." It were mete that one like her should depart, when the flowers began to fade, and cast their petals to the ground.—It were mete that the autumnal winds echoed the wailings of our hearts, in long and mournful requiems for the dead. It were mete that all nature be arrayed in sombre robes, for we have lost our lily. Her gentle spirit passed away as did the lovely flowers. But her pure spirit is at rest. We mourn not "as those without hope," for the words "weep not, I'm going home," are ever with us, as in the hour when with Heaven beaming in her countenance, she uttered them. And oft as we wander to this sacred spot, where reposes only the casket, we feel the bright assurance that in Jesus' brow the gem sparkles the "brightest of the bright," and back to us, in echoing answer, from that glorious land, there comes a voice, "Jesus plucked your lily." Tears dim our eyes, yet we feel the assurance that we shall one day meet her. Casting the eye of faith towards Heaven, we see transplanted in the garden of Paradise, and blooming with heavenly beauty, OUR LOVELY LILY.

Adrian, Michigan, 1859.

MOLLIE.

THE VALUE OF A BIT OF KNOWLEDGE.

In the course of our miscellaneous reading, we came across the following good story, which illustrates the value of a bit of practical information, when applied at the right time:

In the Plaza before St. Peter's, at Rome, stands the most beautiful obelisk in the world. It was brought from the circus of Nero, where it had lain buried for many ages. It was one entire piece of Egyptian marble, 72 feet high, 12 feet square at the base, and 8 feet square at the top, and is computed to weigh about 470 tons, and it is supposed to be 3,000 years old. Much engineering skill was required to remove and erect this piece of art; and the celebrated architect, Domenico Fontane, was selected and engaged by Pope Sixtus V., to carry out the operation. A pedestal, 39 feet high, was built for its reception, and the obelisk brought to its base. Many were the ingenious contrivances prepared for the raising of it to its last resting place, all of which excited the deepest interest among the people.

At length everything was in readiness, and a day was appointed for the great event. A great multitude assembled to witness the ceremony, and the Pope, afraid that the clamour of the people might distract the attention of the architect, issued an edict containing regulations to be kept, and imposing the severest penalties on any one who should, during the lifting of the gigantic stone, utter a single word. Amidst suppressed excitement of feelings and breathless silence, the splendid monument was gradually raised to within a few inches of the top of the pedestal, when its upward motion ceased; it hung suspended, and could not be got further; the tackle was too slack, and there seemed to be no other way than to undo the great work already accomplished. The annoyed architect, in his perplexity, hardly knew how to act; while the silent people were anxiously watching every motion of his features to discover how the problem could be solved.

In the crowd was an old British sailor; he saw the difficulty and how to overcome it, and with stentorian lungs he shouted, "Wet the ropes!"—The vigilant police pounced on the culprit and lodged him in prison; the architect caught the magic words, he put the proposition in force, and the cheers of the people proclaimed the success of the great undertaking. Next day the British criminal was solemnly arraigned before his Holiness; his crime was undeniably proved, and the Pope in solemn language pronounced his sentence to be—that he should receive a pension annually during his lifetime.

These little facts stored up from observation, can never do the owner any harm, and may some day be of great utility; and this story only proves the value of remembering small things as well as great ones, for there is nothing that is too insignificant for man to know, and there is no knowledge that has not its use.

THE NECESSITY OF BODILY HEALTH.—No keenness or culture of intellect that does not embrace culture of health—no wealth, no morality, and not even a religion, that does not embrace the preservation of the physical system from all deterioration, and its cultivation to the highest perfection, will ever last long. No nation or people will ever preserve the weight of influence to which they were naturally entitled, among others, without manliness of development as the only reliable foundation of manliness and reliability of character. All that tends to produce that is so far a vital good.

NATURE AND FAITH.

BY REV. ROBERT PEDDIN.

Nature sees the body dead;
Faith beholds the spirit fled;
Nature sleeps at Jordan's side;
Faith can see the other side;
That but bears farewell and sighs;
This, thy welcome in the skies;
Nature mourns the cruel blow;
Faith assures it is not so;
Nature never sees thee more;
Faith but sees thee gone before;
Nature reads a dismal story;
Faith has visions full of glory;
Nature views the change with sadness;
Faith contemplates it with gladness;
Nature murmurs; faith gives meekness;
"Strength is perfected in weakness;"
Nature writhes and hates the rod;
Faith looks up and blesses God;
That looks downward, this above;
That sees bareness, this sees love.

THE FOREST FUNERAL.

See was a fair child, with masses of long black hair lying over her pillow. Her eye was dark and piercing, and as it met mine, she started slightly, but smiled and looked upward. I spoke a few words to her father, and turning to her, asked her if she knew her condition.

"I know that my Redeemer liveth," said she, in a voice whose melody was like the Aeolian harp. You may imagine that the answer startled me, and with a very few words of the like import, I turned from her. A half hour passed, and she spoke in the same deep, rich, melodious voice—

"Father, I am cold—lie down beside me," and the old man lay down by his dying child, and she twined her arms around his neck, and murmured in a dreamy voice, "Dear father, dear father!"

"My child," said the man, "doth the flood seem deep to thee?"

"Nay, father, for my soul is strong."

"Seest thou the thither shore?"

"I see it, father—and its banks are green with immortal verdure."

"Hearst thou the voices of its inhabitants?"

"I hear them, father, as the voices of angels, falling from afar in the still and solemn night-time; and they call me—her voice, too, father, oh, I heard it then."

"Doth she speak to thee?"

"She speaketh in tones most heavenly."

"Doth she smile?"

"An angel smile! But a cold, calm smile. But I am cold, cold—cold! Father, there is a mist in the room. You'll be lonely. Is this death, father?"

"It is death, my Mary."

"Thank God!"

Sabbath evening came, and a slow, sad procession wound through the forest to the little school-house. There, with simple rites, the good clergyman performed his duty, and went to the grave. The procession was short. There were hardly men and rough, in shooting jackets, and some with rifles on their shoulders. But their warm hearts gave beauty to their unshaven faces, as they stood in reverent silence by the grave. The river murmured, and the birds sang, and so we buried her.

I saw the sun go down from the same spot—and the stars were bright before I left—for I always had an idea that a grave-yard was the nearest place to heaven on earth—and, with old Sir Thomas Brown, I love to see a church in a grave-yard, for even as we pass through the place of graves to the Temple of God on earth, so we must pass through the grave to the Temple of God on High.—Selected.

THE BLESSED COUNTRY.—So much as moments are exceeded by eternity, and the sighing of a man by the joys of an angel, and a salutary frown by the light of God's countenance, a few frowns by the infinite and eternal hallelujahs, so much are the sorrows of the body to be undervalued in respect to what is deposited for them in the treasures of eternity. Their sorrows can die, but so cannot their joys. And, if the blessed martyrs and confessors were asked concerning their past sufferings, and their present rest, and the joys of their certain expectations, you should hear them glory in nothing, but in the mercies of God, and in the cross of the Lord Jesus. Every chain is a ray of light, and every prison is a palace, and every loss is the purchase of a kingdom, and every affront in the cause of God is an eternal honor, and every day of sorrow is a thousand years of comfort, multiplied with a never-ceasing numeration; days without nights, joys without sorrows, sanctity without sin, charity without stain, possession without fear, society without envying, communication of joys without lessening; and they shall dwell in a blessed country, where an enemy never entered, and from whence a friend never went away.—Jeremy Taylor.

REASONS FOR BEING HOLY.—A man who has been redeemed by the blood of the Son of God should be pure. He who is an heir of life should be holy. He who is attended by celestial beings, and who is soon, he knows not how soon, to be translated to heaven, should be holy. Are angels my attendants? then I should walk worthy of my companionship. Am I soon to go and dwell with angels? then I should be pure. Are these feet soon to tread the courts of heaven? Is this tongue soon to unite with heavenly beings in praising God? Are these eyes of mine soon to look on the throne of eternal glory, and on the ascended Redeemer? Then these feet, and eyes, and lips, should be pure and holy; and I should be dead to the world, and live for heaven.—Albert Barnes.

The true measure of loving God, is to love him without measure.—Countess of Warwick.

WHAT SHALL WE TEACH, AND HOW?

It is characteristic of our American people to drive ahead in all the departments of life; and it is this go-ahead principle which makes us the enterprising nation that we are. Yet even this, like all other things, may be overdone; in fact, in many instances we do need restraint. There is no other department in the various missions of humanity in which extremeism is so fraught with disastrous results, as in the teaching of children. Parents are superficial, and in looking for the main chance, and delving hard to rapidly accumulate gold,—to rear splendid residences, and appear in costly equipages,—neglect their own moral and intellectual culture, and, as a consequence, the proper education of their children is totally overlooked. The teacher who will drive the child fast—make the greatest display, by storing the mind with the greatest number of studies—is their model teacher, and, of course, commands the highest remuneration. Teachers—knowing the facts—acquainted with the weakness of their patrons—seek to flatter their vanity, thereby advancing themselves in the favor of their employers. As one who delights in the instruction of the young, I call upon my fellow teachers to reflect upon the consequences of such an extravagant career. Beshink you of the importance of your mission—look at the precious gem before you,—the immortal mind, Nature's crowning element, placed in your hands to mould, making you the agent of morality and virtue—placing in your possession the casket of seeds for future usefulness and happiness. It is of paramount importance, then, that you sow them judiciously.

But to our question. How shall they be sown?—or, "what shall be taught?" Even though it be to secure the approbation and patronage of the most influential, deviate not from instructing your pupils in the most thorough manner. Commencing at the foot of the Hill of Science, make sure and steadfast every step of the advancing scholar. Let each branch be taught as though it were of the highest importance. The greatest fault in teaching has been a too rapid succession of studies. The child is hurried from letters to reading,—through all the successive series of readers,—and attains such a flippancy of speech and pronunciation, that it is really charming to hear the little fellow go on, especially if he possesses a good development of the perceptive faculties. His slow classmate even stumbles over the simplest words, but his "quick neighbor" tells him all the harder ones, while neither reads understandingly. In a course of reading, teach thoroughly; have your pupils obtain a clear utterance, then a correct pronunciation, and then the meaning of what is pronounced. Let not one reading exercise pass, until your class can give the definitions of the most prominent words.—Geography is not half learned, and if its importance was more fully realized, it would be taught better than it is. Arithmetic is to be understood, therefore teach it understandingly,—be not in haste to leave the mental for the written,—the simpler branches for higher, but master each in its order. All the higher branches may be taught "with success" in our common schools—providing the rudiments have been learned correctly.

But I fear I have already been too prosy, therefore will leave the subject for the present. In the teachers of our Common Schools, more than any other class of citizens, lies the destiny of our future. As our children are reared so will the next generation be. It is their mission to mould our nationality, to eradicate existing evils, and build an edifice of morality. They should make themselves active and influential reformers. Let their aim be high, their work broad and deep—and they will be crowned with the highest honors of the land, and the just approbation of Heaven. M.

84 Johnsville, N. Y., 1859.

THE WILL.

How many times have we heard both parents and teachers say, such a child must have his will broken—he is too headstrong. Is the will ever broken? It may be made to bend, but never, it is never broken. "If John was not so willful, he would do well enough," say the parent and teacher, when every success that crowns his endeavors, is the fruit of the will. Guide this heaven-born gift, aid the child in placing this firm, stronger lever beneath good and noble purposes, and much will be accomplished. When the Will joins hands with Reason and Religion, its power will be for good.—Strong will is the great characteristic of all those who have achieved power, either for good or evil, in the world's history. The will is the most prompt and decisive faculty of the mind, and impels to immediate action.

It is necessary for the teacher to possess this firmness of purpose, that he may cultivate the same in his pupils. If they find a will to meet each duty faithfully, they will be inspired with the same feeling in their duties.

I have often seen this spirit cultivated in a class. For instance: Not long since a difficult problem was given a class, with this remark: Who will have the will to overcome the difficulty? The tinder was struck, a strong purpose lighted even the most indolent eye. The morrow came, and the question, How many have failed? brought up many hands. "Then in this class there is no will—lever to more obstructions. Shall I say you give it up?" For a moment there were glances passed from one and another in the class, and then an emphatic "No," fell upon my ear. One, more excitable than the others, started from his seat, saying "I will, I will have it," and more than one heart responded, *aye*. The next recitation did not bring failures. The great river of the will passed the barrier, and in its right channel moved on towards the ocean of power. It is not one lesson gained,

but strength for future efforts. Teacher, it is for you to direct these efforts. Your purposes, directed in the path of knowledge, virtue and truth, will aid your pupils. If you are feeble, inefficient, lacking in that power which wills, and it is done, your pupils will be your prototype. How many times I have seen the teacher waiting in this vital mental principle, and the student possessing a sufficient quantity, using it in every way possible to aggravate his teacher, while the teacher deplored the willfulness of human nature.

Not long since I accompanied a teacher on her visit to the parents of a boy of nine summers, who had been playing truant. It was the second offence. We found the father at home, and immediately introduced the object of our call. With tears he answered, "I have tried to make Johnny be a good boy, but he will not. I have punished him, and it does no good. If you will correct him, I shall be very much obliged. I cannot do anything more with him; I fear he is ruined." A boy of nine.—Was the boy to blame for possessing a power stronger than this specimen of a man? There was no home will to guide and aid the little fellow in his purposes. He must use the power. He will to do wrong, and did wrong because the weak father did not teach to will to do right. Nature teaches us to cultivate the will; not to make it the tool of wicked purposes, but the acting force for good.—E. A. R., in *N. Y. Teacher*.

The Reviewer.

THE LIFE OF NORTH AMERICAN INSECTS. By B. JACOB, late Professor of Zoology and Botany in the College of New Jersey. With numerous illustrations from Specimens in the Cabinet of the Author. [16mo.—pp. 819.] New York: Harper & Bros.

This is a very readable book, and must prove very interesting to all who are willing to think. It gives knowledge on one part of Natural History now first made accessible to the great body of readers in our country. It is also on a class of animals found about us, which are very useful or very injurious and annoying. Many of them, too, are splendid in beauty, and their organization is wonderful. Their modes of life are wonderfully diversified, and often exceedingly attractive to observers. As the animals of this class are nearly divided into two parts, they are called *Insects*, from the Latin, *to cut into*, and the science is called Entomology from a Greek word of the same import as the Latin just noticed. As they have not a vertebrate column or a back-bone, like beasts, birds, reptiles and fishes, they are named *invertebrate* animals, and in their perfect state have *six legs*, for the use of a body formed of united or *jointed* rings.

It is too late to think of *Insects* as contemptible, ugly, or hateful things, when the great Creator has formed them and placed them in His world and our world. It is wiser to know more of Him by the study of His wonderful works. Has the infinite Hand given these their wonderful adaptations and curious instincts and endless variety, for us only to show our weakness, ignorance, or insensibility?

The work is not a regular system of Entomology, but has enough of science to give more zeal to its study. There should be many thousands of readers of such a book. Please to refer to the first insect of the work, the Lady Bird, page 20 to 23; to the Katydid on page 105 to 111; the Silk-Worm Moth, beginning on page 141, for instance. Even the Life of the Caterpillar, on page 106, or on page 169 to 173, ought to be understood. Sold by DEWEY.

HINTS TOWARD PHYSICAL PERFECTION: or the Philosophy of Human Beauty; showing how to Acquire and Retain Bodily Symmetry, Health and Vigor; secure Long Life; and avoid the Infirmitates and Deformities of Age. By D. H. JACQUES. [16mo.—pp. 239.] New York: Fowler & Wells.

Is the preface to this attractive volume the author says—"We have aimed, not so much to unfold new principles or present novel facts, as to popularize those which scientific investigation has already established, and show, in some cases at least, more fully and clearly than had hitherto been done, their practical application." The work is neatly printed and illustrated, and embraces a variety of topics relating to Anatomy, Physiology, Embryology, Mental and Physical Culture, Health, Beauty, Longevity, &c. The author maintains that the physical improvement of the race is certain and easy of accomplishment by the use of the legitimate means pointed out in this treatise, and that this result pertains not only to individuals themselves, but to their offspring, whose conformation, tempers and happiness are influenced by the temporary as well as permanent condition of the parents. We can commend this work to the general reader, as containing much that is interesting and valuable—while, at the same time, we may not assent to all its physiological deductions, nor pledge ourselves to the belief that physiology is the science thro' whose benign influence an era of physical beauty and perfection is to dawn on our race. From the Publishers—sold by DEWEY.

MAP OF THE SEAT OF WAR—ITALY.

THE accounts published in the papers of the situation and movements of the two great armies now menacing each other in Italy and awaiting the moment of deadly combat are mainly unintelligible, and, therefore, uninteresting. This arises from the fact that but few are familiar with the geography of the country, or even the names of the towns and rivers, and therefore when it is stated that the Austrians had retreated from Vercelli or that Napoleon had arrived at Alessandria, and as soon as he reached Casale it was expected active operations would be commenced, no idea is conveyed to the mind of the movements of the troops or the advantages gained or lost by either. To aid in making this matter clear, so that hereafter all we publish on the subject may be well understood, we have prepared a map of Northern and Central Italy, the seat of the war. For the sake of clearness we omit the small and comparatively unimportant places, giving only those likely to be mentioned in the accounts given of the progress of the conflict.

PRINCIPAL DIVISIONS OF ITALY.

The divisions of ITALY, as shown in our map, are Lombardy, Piedmont, Savoy, Parma, Modena, Tuscany, &c. Lombardy belongs to Austria; Parma, Modena, Tuscany, &c., are independent States.

The Government of Sardinia embraces Piedmont and Savoy as shown on the map, and the island of Sardinia, South of Corsica, which is not shown. The Eastern portion of Piedmont is a part of the great plain of Lombardy, and is divided from Lombardy proper by the Ticino river. On the West it is enclosed by the Alps and Appenines. Savoy contains about 600,000 inhabitants, and a little over 400,000 square miles. The country is mountainous and infertile. Savoy and Piedmont contain about 5,000,000 inhabitants, and keep a standing army of 60,000.

PRINCIPAL CITIES OF SARDINIA.

TUNIS, the capital of Sardinia is situated on the Po river, 79 miles South-West of Milan. It lies in a rich and well-watered plain, studded with fine residences. Population about 150,000.

Genoa is the next city in importance, and is situated on the Gulf of Genoa (Mediterranean sea.) It is a strongly fortified seaport, containing over 100,000 inhabitants, and is 79 miles South-East of Tunis.

Alessandria is a fortified town 46 miles South-East of Tunis, and nearly the same distance North of Genoa. Population, including suburbs, 40,000. Mortara is about 25 miles North-East of Alessandria. It is fortified, but contains only about 6,000 inhabitants, as it is considered unhealthy on account of the miasma arising from the rice-fields with which it is surrounded.

Casale is a city of over 20,000, on the river Po, 38 miles North-East of Tunis, and about 20 South-West of Mortara.

Vercelli, (shown by a star in the map,) is on the right bank of the Sesia river, 14 miles North of Casale. Population about 20,000.

Susa is a small town about 30 miles West of Tunis, at the junction of the principal routes across the Alps.

RIVERS OF SARDINIA.

The principal river of Italy is the Po. It rises in Monte Viso, flows East in a tortuous course and empties into the Adriatic. Length 340 miles. In many parts it is above the neighboring plains, and care is necessary to prevent inundations.

The Ticino is 125 miles in length, rises in Switzerland and empties into the Po, forming the boundary between Piedmont and Lombardy. The Sesia is a small stream about 30 miles West of the Ticino, and empties into the Po near Casale.

The Dora is a small stream rising in the Alps, running East and South-East for about 90 miles, emptying into the Po about 20 miles East of Tunis.

THE POSITION OF THE ARMIES.

The Austrians who seem to have commenced the war with the greatest precipitation, crossed the Ticino river into Piedmont, with an army said to be over 100,000 strong, and advanced westward as far as the river Sesia, thirty miles into the Sardinian territory on the way to Tunis, and within less than sixty miles of that capital. The object of the Austrians was supposed to be to take Tunis before the French could furnish their allies aid. In this they were checked by heavy rains, which swelled the rivers and flooded the flat country, as well as by the rapid movements of the French, who soon had an army sufficient to intercept their foes, with some confidence of success should an engagement take place. About the 10th of May they retreated from Vercelli, re-crossed the Sesia river, and fell back about 20 miles, to Mortara, which is only 25 miles North-East of Alessandria, where NAPOLEON was at last accounts.

The French and Sardinians at the outset established themselves in two lines at right-angles with each other, the one on the Dora, a little river, about 30 miles west of the Sesia, and emptying into the Po, about 15 miles North-East of Tunis. This position seems to be well chosen to protect the capital, while it was convenient for reinforcements from France over the Alps, by the way of Susa. The

other line was on the Po, at Casale, 38 miles North-East of Tunis, and 70 miles from Genoa, from which place this line receives its reinforcements.

RISE AND FALL OF LAKE ONTARIO.

THAT there should be variations in the surface of the Lake, sometimes higher and at others lower, was to be expected. They have long been noticed. But, the absence of any regular and continued measures of the fluctuations, has permitted the existence of many absurd notions. One of these was the notion of a regular rise for several years, and then a regular fall for about as many more.

For the last thirteen years the variations have been measured for every month, at the mouth of the Genesee. They are given in the following table. They show the above notion to be baseless. They exhibit also a regularity in the time of highest and lowest level in each year, subject to a difference depending on the quantity of water in rain and snow, on the great water-shed which passes through the great chain of Lakes to the ocean. The more rain and the more extensive, the higher is the lake, and vice versa, while in other years the level is nearer the mean. To this should be added the small difference in the quantity of water evaporated in different years. As Lake Ontario is the eastern of this chain of great Lakes, the variation of level must generally be later than that in Lake Erie and the Western Lakes. The range in the year, and the greatest and least level in several years is shown to be about the same in all the lakes as far west as Sault St. Marie. The table will be readily understood.

VARIATIONS OF THE LEVEL OF LAKE ONTARIO, FOR THE ENRELATED YEARS MEASURED FROM A FIXED POINT
 DOVEWARDS TO THE WATER. THE LARGER THE NUMBER, THE LOWER THE LEVEL.

TABLE.—Measure in inches.

Year.	Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Mean.	Range.	Relative.

FOREIGN NEWS.

From the Seat of War.

The news from the seat of war is not of much importance; several steamers are about due and we may receive further information before going to press. The *America* arrived at Halifax, Wednesday, June 1st. The *Cardinal* had taken possession of Vercelli, after its abandonment by the Austrians. The Austrians had been driven from the town, and a small town some twenty-five miles southeast of Novara and about twelve N. E. from Mortara. A dispatch from Paris dated the 10th ult., says:—"Great movements of troops have taken place, and a collision is expected to-day or to-morrow." Rumors from other quarters state that a battle is considered imminent; but the *London Times*, in summing up the position of affairs, considers it almost certain that June will have begun before any great blow is struck.

It was reported that the Austrian General Gyulai had sent word to his government that his provisions were beginning to fail in Piedmont, and that he would not be able to hold his present position for more than fifteen days longer; and that the Emperor of Austria arrived on the 10th, at Milan, and departed directly for Paris, accompanied by General Hess.

The French fleet before Venice had already taken twenty vessels, but the *Times* correspondent in the Austrian camp, says that a naval attack on Venice would have no chance of success. Every channel has either been quite blockaded by sunken ships, or vessels laden with stores are moved close by, ready to close the small remaining passages at a few minutes' notice, and guns of large caliber command all these obstacles. The Paris correspondent of the *Times*, however, says that the French squadron is not to attack Venice, but merely to blockade that port for the present.

The Liverpool *Post* professes to have reliable information explanatory of Austria's mysterious proceedings. It says the moment the French troops cross the Ticino, the Austrian troops will march directly on Paris. Russia will then join Austria, and the reward of what looks like treachery is to be Moldavia and Wallachia. The crossing of the Ticino will be regarded as an invasion of Austrian territory. This is to be followed by an European Alliance against Napoleon.

GREAT BRITAIN.—The Parliamentary elections were completed, with the following result:—Liberals elected, 353; Conservatives elected, 302. This is a Ministerial gain of 23. Included in the Liberals are about 60 independent members, who will hold the balance of power. The Queen's speech, it was expected, would not be delivered before the 10th of June. The *Daily News* says that the Liberals will insist in taking up the Reform question at the point where it stood when the dissolution of Parliament took place.

Carrying Contraband Goods.—The shipping interest is greatly agitated as to the conveyance of goods contraband of war. Lord Malmsbury, in reply to a special inquiry whether the neutrality proclamation contemplated coal as contraband, says that the passages in the proclamation referring to contraband goods are not intended to prohibit the exportation of coal or any other article, but to warn His Majesty's subjects that if they do carry for the use of one belligerent, articles which are contraband, and their property be captured by another belligerent, Her Majesty's Government will not undertake to interfere against such capture.

The *Shipping Gazette* suggests that the Government should call on the belligerents to specify, by proclamation, those articles which they are resolved henceforth shall constitute contraband of war.

Latest Arrival.—The First Battle of Fort—As we anticipated, another arrival, just before going to press, has brought us a few days later news from the seat of war. The *City of Washington*, which passed Cape Race on Saturday, the 4th inst., brings account of a battle between the Allies and Austrians. It was fought at Montebello, on the 21st ult. Montebello is an unimportant village 25 miles E. N. E. of Alessandria.

The French account says that the Austrians, 15,000 strong, under Gen. Stradon, attacked the advance post of Marshal Baraguay d'Hilliers, and were driven back by Gen. Foriss division, after a fierce battle of four hours duration. The Allies, including some Piedmontese cavalry, carried Montebello, but did not pursue the Austrians. The loss of the latter is stated by the French at 1,500 to 2,000, and that of the French at 800 to 700, of whom many were officers. Two hundred Austrians, including a Colonel, were taken prisoners.

The actual strength of the French is not stated. Report says they numbered from 8,000 to 7,000, besides a regiment of Sardinian cavalry. The Austrian account does not acknowledge this to be much of a battle, and simply states that Gen. Stradon pushed forward a reconnaissance by forced march toward Ligma and Montebello, but after a hot fight with the French force, of superior strength, retreated behind the Po in perfect order.

A Sardinian bulletin also announces that the extreme left of the army, under Gen. Caidoni, forced a passage over the Soia, putting the Austrians to flight.

Other trifling engagements are reported. The wounded at the battle of Montebello had been carried to Alessandria. The King of Naples is dead, and Francis II. has assumed the reins of Government. England and France are about to send representatives to Naples. Revolutionary movements are reported in Lombardy. Prince Napoleon, with a small French force, had arrived at Leghorn. It is rumored that six English men-of-war had entered the Adriatic.

Special Notices.

FARMERS, don't forget that you must use a top-dressing of Guano and Plaster for your Corn, Beans and Potatoes. Tobacco can't be half grown without Guano. After the late frost you must apply stimulants.

SPURGEON'S SERMONS APPEAR IN THE "NEW YORK WEEKLY" EVERY WEEK.—By reference to our advertising columns it will be seen that the enterprising publishers of this admirable literary journal have, at great expense, made an arrangement to publish every sermon of this very celebrated London divine, revised and corrected by himself, and forwarded by every steamer to every part of the world, and its energetic publishers to the patronage and support of the enlightened public.

Marriages.

In Iowa City, May 11, 1859, by Rev. J. Phillips, JAMES H. KURTZ and MARGARET J. ALLEN, daughter of Col. LEMAS ALLEN.

In the 24 inst., by Rev. John Johnson, of Newburg, Mr. THOMAS ALLEN, of Pendleton, and Miss AGNES L. BOSSHAM, of Lockport.

Markets, Commerce, &c.

ROCHESTER, N.Y., June 11, 1859.

The general feeling in our market this A. M. is one of depression. Flour has dropped \$1 on the barrel on Winter Wheat make, while Spring holds its last week's rates. There is hardly enough doing to fix prices.

Grain.—Winter Wheat dropping, with a decline since our last of 10¢ per bushel. Best White Canada is now selling at 82¢ for choice. Corn has lost its firmness and is now selling at 72¢ for choice. In the range has been established, 55¢ to 60¢ being the figures.

Dairy, &c.—Butter is firm at 12¢ for nice roll. Eggs 12¢ per dozen.

Wool.—Nothing doing as yet. Wool buyers are holding off for a reduction—maybe they'll get it, maybe not—and the probabilities are that all who can afford to wait will do so for a short period. We will endeavor to keep readers posted as to transactions throughout the country and they can judge for themselves as to what movement their part will result in the greatest benefit to themselves.

THE WAR.

BY ALFRED TENNYSON.

There is a sound of thunder afar,
Storm in the South that darkens the day,
Storm of battle and thunder of war,
Well if it do not roll our way.

Be not deaf to the sound that warns!
Be not gull'd by a deep-sea's plea!
Are eyes of thistles, or grapes of thorns?
How should a deep-sea set men free?

Form! form! Riflemen form!
Ready, be ready to meet the storm!
Riflemen, riflemen, riflemen form!

Let your reforms for a moment go,
Look to your butts and take good aim,
Better a rotten borough or so,
That a rotten fleet or a city in flames!

Form! form! Riflemen form!
Ready, be ready to meet the storm!
Riflemen, riflemen, riflemen form!

Form, be ready to do or die!
Form in Freedom's name and the Queen's!
True that we have a faithful ally,
But only the Devil knows what he means.

Form! form! Riflemen form!
Ready, be ready to meet the storm!
Riflemen, riflemen, riflemen form!

THE "HOUSEHOLD ANGELS"

OR
ZUNGE-STADT.

From the German—(text of Der Mensch habe den zweien
einen Mund und zwei Ohren, damit er weniger
spreche, und mehr höre.)

BY CAROLINE A. HOWARD.

Chapter III.

[Continued from page 188, last No.]

Kir had promised to go with SERENE SLEEPER and introduce her to ANNIE RHINEHART. When SERENE called for that purpose, she was accompanied by JANE ANDERSON. Having duly expounded to them all the latest news, including the progress of her acquaintance with the RHINEHARTS, and the remarkable beauty and gallantry of AUGUST, KITTY dressed and they set out. They found ANNIE at home, but were not favored with a glimpse of the wonderful brother.

"I hope you will get acquainted, and feel at home in Zunge-Stadt soon. It must be very dismal to be in a strange place," said SERENE to ANNIE.

"I do not find it so at all," said ANNIE. "I have so many sources of pleasure, and my own family are company to me."

"Well, to be sure," said JANE ANDERSON, "that is something, though I, for one, do not like to stay at home as much as perhaps I ought to. But you are more fortunate in respect to family, than the most of us. There's Kir, an only child. SERENE has two brothers, both younger than herself, while I have no brother and am the eldest of five girls. MAGGIE SWEETZER has an older sister and brother, but the brother has gone West."

"We are not many, but really, Miss RHINEHART, we are nearly all the girls there are in Zunge-Stadt," Kir chimed in.

"Do you know a young lady, in this town, named FRANTZ?—LOUISE FRANTZ?" asked ANNIE. Kir gave SERENE a quick, intelligent glance, as JANE replied.

"Miss FRANTZ? She must be the young lady who dresses in black and boards at Mrs. MULLER'S. I am not acquainted with her." She spoke coldly, and as if she had no wish to be acquainted.

"Has she called on you?" inquired Kir, significantly.

"She has not, but I understand that she is very beautiful and very talented. I have quite a curiosity to see her. Pardon me, if I mistake, but your manner implies that there is something peculiar about her. May I inquire if it is anything public?" said ANNIE.

Kir hesitatingly said, "Well, no! there's nothing as I know of, only I thought it hardly likely that she would call."

"The fact is," said JANE, who was very plain spoken, "that when she first came here she went to the Academy to school, and at first the girls admired her and tried to find out all about her. She took all their advances very coolly, and they got little information. As a natural consequence, they speculated the more on what they could learn, and a variety of reports regarding her were circulated. She took offense at their impertinence, and since she left school has not returned a single call that we girls have made her."

"When I called there," said Kir warmly, "she did not treat me civilly. Every look and word was freezing."

"Strange!" said ANNIE. "Unless she had some severe provocation, I should think she might be much as I used to. One tires of them."

"So they do," he replied, "especially if the mind be strongly engaged with more serious and weighty thoughts. Such things jar upon it."

"I have not seen you in some time, Miss KITTY. I am glad to find you well."

"And pray whose fault is it, if you have not?" replied KITTY, archly, and with a demure look in her blue eyes. "Am I not as much one of the lambs of your flock (a stray one, I admit,) as any who go to the fold without coaxing or driving?"

"He gave a quizzical smile, and said—"I tho't perhaps certain young friends at the white house, near you, might have monopolized your attention. By the way, the RHINEHARTS have taken a few in our church. I have not called yet, but I shall soon."

"I think," said Kir, "that you will be very much pleased with ANNIE RHINEHART. I feel al-

her aunt, Mrs. MILLER, he talked with her and he should think she had done nothing but read all her life, but that her talk was much too fine for him. MAGGIE SWEETZER said that she was walking with her sister in Bijar Lane, and they came suddenly upon Miss FRANTZ sitting on a stone by the brook. She arose hastily, thrusting a pencil and paper into her pocket and walked on. She must have been writing or drawing."

"Well," said KITTY, "there is a saying that nobody is ever so bad but somebody can love them, and I suppose it's so with her, for folks say she is engaged to PAUL WAGNER. He goes there a sight. I suppose she takes him for pity, for nobody that I know would have him. He is as homely as a hedge-fence and dreadful dull and prosy when he talks. He is one of Judge TANGLETON'S clerks, and he digs all the time at his business. He must be awfully stingy, for he hasn't had a new coat since I can remember, and he never spends money in any sort of amusement."

"Why, Kir!" said SERENE, "what a setting out you do give the poor fellow. Miss RHINEHART will think that you are a disappointed admirer of his."

Now SERENE knew her mark and fully expected the indignant glance which her dear friend threw upon her. But further remark was cut short by JANE, who, looking from the window, exclaimed,

"Girls! we must be going, for there comes PRISCILLA OGLEBY. Let us leave her a clear field, for doubtless she has come on purpose to give us all a character."

ANNIE bade them good-bye with a half sigh of relief, and mingled feelings of wonder, amusement, and indifference, and ushered in Miss OGLEBY.

It was not late and the girls concluded to pay a visit to MAGGIE SWEETZER and her sister LISBET. On the way, the last call was discussed.

"Miss RHINEHART is a very fine looking girl," said candid JANE ANDERSON. "She is intelligent and amiable looking."

"She looks well enough," said KITTY, "but I think her cold and stiff. I've been there several times and she is always just so. She listens to all you say, as polite as possible, but seems afraid to say a word more than is necessary herself. It makes one feel uneasy, as if she were suspicious of them. She is not half so agreeable as her brother; he talks a great deal and is very gay and witty."

"O, it's natural that you should prefer the brother—a matter of course," said SERENE, who knew Kir's weak point and never let slip a chance to give her a thrust, in revenge for her being the prettiest and most attractive.

"I think," said JANE, "that I can explain her manner. I have no doubt that Miss OGLEBY has described us to her, and you can judge as well as I how flattering it would be. You know our poor abused town has been famous for gossip since its earliest day and it is scarcely possible that Miss RHINEHART comes here ignorant of the fact."

"I confess," said SERENE, "that our recent conversation has not been calculated to lessen that impression."

Of course these young ladies gave MAGGIE SWEETZER and her sister the benefit of their ideas on ANNIE'S house, furniture, dress, looks and conversation, including what had been said about LOUISE FRANTZ.

"I should think that LOUISE might be just such a person as Miss RHINEHART would like, and I shouldn't wonder if they soon become friends," said MAGGIE, whose sole peculiarity seemed to be a mild and sunny temper.

"I'll bet not, after what she said this afternoon," said KITTY. "She said if Miss FRANTZ was a lady, she would be polite, even if she didn't want our acquaintance."

"That does not argue that she thinks she is not a lady," said JANE, who liked nothing better than to bother Kir WINKLEMAN, whose character for veracity was not high among the girls.

"And when we were talking about PAUL WAGNER, what was it she said, SERENE?"

"I didn't hear her say anything," replied SERENE.

"O, fudge! My dear SERENE, you are a nice girl in your way, but I sum you are stupid sometimes."

"Thank you, my love. I see you still make use of that lady-like expression, for which you were noted at school."

"Heavens!" cried Kir, starting, "how I did jump. There's the door-bell, and as I'm a sinner, there's the Rev. IMMANUEL CHRISTIAN. Now, girls, look in your pockets and bring out your Sunday faces!"

"Good afternoon, young ladies," said a very pleasant voice, from a tall, intellectual-looking man who stood in the door-way.

IMMANUEL CHRISTIAN might have been thirty years of age, but his countenance bore evidence that, whatever his years, they had been well improved. He was a general favorite among the young folks, and they all paid him the compliment, to try to appear to the best advantage in his eyes.

"Miss JANE, how did you enjoy the ball the other night?"

"O, very much, Mr. CHRISTIAN. It was the best, I think, they ever got up in Zunge-Stadt. There was a fine company, and, as you know, I am always fond of music and dancing."

"Did you go, Miss SERENE?" he then said, with what Kir thought an earnest look.

"O, no! I do not care for such things nearly as much as I used to. One tires of them."

"So they do," he replied, "especially if the mind be strongly engaged with more serious and weighty thoughts. Such things jar upon it."

"I have not seen you in some time, Miss KITTY. I am glad to find you well."

"And pray whose fault is it, if you have not?" replied KITTY, archly, and with a demure look in her blue eyes. "Am I not as much one of the lambs of your flock (a stray one, I admit,) as any who go to the fold without coaxing or driving?"

"He gave a quizzical smile, and said—"I tho't perhaps certain young friends at the white house, near you, might have monopolized your attention. By the way, the RHINEHARTS have taken a few in our church. I have not called yet, but I shall soon."

"I think," said Kir, "that you will be very much pleased with ANNIE RHINEHART. I feel al-

ready somewhat acquainted with her. I think she is just such a girl as you would admire."

"And what kind of a girl do you think I would admire, Miss KITTY?"

"O, learned, dignified and cultivated."

"Thank you! You pay a high compliment to my taste, but I also like an artless, mirthful and affectionate nature."

Kir looked at SERENE with a conscious smile, for she knew that remark could never apply to her. The conversation then became more general and less trivial. Sunday school and sewing societies were talked over, and SERENE SLEEPER took a prominent part. LISBET SWEETZER, a delicate, spiritual-looking girl, seemed much interested.

As soon as Mr. CHRISTIAN left, SERENE turned to Kir, and said, smilingly, "It seems to me that you sang a very different tune to Mr. CHRISTIAN about ANNIE RHINEHART, from what you sang to us a little while before."

"Yes, I know, but I spoke of her to you as she appeared to me, and to him as I knew she would appear to him after he has known her awhile."

"And you wanted him to give you credit for more discernment than he thought you had?" said JANE.

"I wanted to help the man to a friend that I thought could appreciate him. I don't know of any girl in this town that he can care much about, unless it is LOUISE FRANTZ. They say he goes there a great deal."

SERENE looked daggers at her friend, and said—"I'm sure of one thing. I wouldn't speak with two tongues—one to go with a Sunday face, the other with the every-day one."

"I don't think you would, SERENE," retorted Kir. "The 'gift of tongues' don't seem to have been one of your gifts. And I don't think I would put on a Sunday face and talk like a saint or missionary's wife, even for the sake of having Rev. IMMANUEL CHRISTIAN come to our house once a week or so, to talk to me about my soul's interest."

Really, SERENE, you have so far forsaken the vanities of this world that I wonder you are not in a convent. I thought I should have laughed right out to hear you tell Mr. CHRISTIAN that you didn't care for balls and such things, when we all knew you were intending to go with GUS FANGLETON, and he didn't ask you."

"Kir, I beseech you, do not make light of serious matters," said LISBET SWEETZER, who, it was understood, was going to join the church soon, with several others—among whom rumor said that LOUISE FRANTZ and SERENE SLEEPER were two.

"To change the subject," said JANE, "I think, girls, that some of us ought to get up a sociable, or little evening party, and invite the RHINEHARTS. Who shall it be?"

"O, let it be me!" said MAGGIE; "I should like it extremely. I know me would be willing."

"We'll see about it."

Chapter IV.

As the girls had predicted, Miss OGLEBY had much to say about them, and in general her remarks would have no tendency to make them vain. Miss OGLEBY was "a maiden lady, thin and spare," quite well preserved—like barberries, "warranted to keep for years and retain their acid." Her father had been a wealthy and quite noted lawyer, but misfortunes had come upon them, he had lost much of his property through the dishonesty of others, and from being one of the aristocracy of Upperton, his daughter had come down to the residence of a small cottage in Zunge-Stadt, who lived upon the remnant of their property, and boarded the bachelor minister. The latter part of her fate was borne with more resignation than the former. She almost worshiped the young "divine," who, in the kindness of his heart, called her "Aunt PRISCILLA," and she watched over his interests most zealously. She knew that she was not loved by either young or old in Zunge-Stadt. Somehow she seemed naturally endowed with a faculty for minding everybody's business but her own, which faculty years and leisure had fully developed.

PRISCILLA had had her favorites among the young girls, nearly all of whom had stood in that position at some time, but it was a precarious one, and they were one by one dislodged, through their own thoughtlessness or some sudden and unexplained dislike of her. She knew that Mr. CHRISTIAN was much attached to his people, especially the young, and the interest seemed mutual, much more so than Miss OGLEBY desired. She could not see how he could endure some people, and she would have wished him to carry his regard for himself so far as to be indifferent to those who were her own aversion. But in this she was powerless, though she never relaxed in her self-imposed duty of keeping him "posted up" in the short comings of his parishioners. She had been in the habit, by way of showing a particular partiality towards any who had the rare fortune to please her, of inviting them to tea at her own house, and since Mr. CHRISTIAN had boarded with her, the girls had tried to keep the right side of her temper sufficiently to win this privilege, but she was more than a match for them in maneuvering.

Mrs. MILLER had always treated her with the greatest forbearance and consideration and held a high place in her very small circle of friends.—LOUISE, following her aunt's example, treated her well, though not familiarly. These two were prominent on her visiting list, and to them she now added another in the person of ANNIE RHINEHART. Let us do her the credit to say that she was really a well educated and intelligent woman. In her father's life-time she had enjoyed great advantages and had improved them. She had also, I believe, had a sweeter temper before disappointment, both matrimonial and pecuniary, had overtaken her. She certainly displayed good taste in seeking the society of IMMANUEL CHRISTIAN, LOUISE FRANTZ and ANNIE RHINEHART, and through her agency, the three became social and congenial friends.

[Continued next week.]

The man who carries a lantern in a dark night can have friends all around him, walking safely by the help of its rays, and he not defrauded. So be who has the God-given light of hope in his breast can help on many others in this world's darkness, not to his own loss, but to their precious gain.

THE RISK IN READING.

No considerate and wise parent will trust his child—to no prudent person will trust himself—to a stranger who he has reason to suspect will commit an injury upon him in any way. The parent pours into his child's ear many cautions concerning the company he may fall into, and restrains him from entering into places of unknown or suspicious character. Yet he most inconsistently will allow him the company of books which are strangers, and books which deserve to be suspected of an immoral tendency. The names of some authors ought to be enough to condemn volumes bearing them, but children are permitted society with their works. Is this wise and prudent?

Yet such is the common practice of reading books of whose nature the reader is ignorant, and in this practice lies a great moral risk; for very few can peruse a bad volume without being contaminated in some degree. Some minds, like some beasts, have no choice of aliment, and devour whatever falls in their way. But this should not be the practice of a person of pure taste, intelligent mind and healthy conscience. While you would avoid intimacy with a person of whose morals you know nothing, why is it, that with a most unsafe and injudicious hospitality, you hesitate not to take to your bosom—to receive to your heart—to admit to the secret chambers of imagery—into your very life, a book, which in one page may contain more to poison your soul—more to excite impure thoughts and impious dispositions, than a vicious person may be able to do in a twelve-month?

Whence comes much of looseness of principle, the extravagant views and purposes, the disorganizing and infidel notions, the vile irreverence and total neglect of sacred duties, manifest in some persons, but from their reading? If a man may be known by the company he keeps, he may be doubly so by the books he reads. And how many books which now have done their mischief, would have been cast into the fire, had their character been known before the perusal, by persons who now sympathize with their abominable contents!

We repeat, that there is a great moral risk in beginning to read a book of whose character you are ignorant. We seriously advise our young friends especially not to open a volume till they have some positive reason for believing it safe and instructive to read. Look to its recommendations; learn, if possible, its author, and heed the advice of friends concerning it; for that very book may be the moving cause of your deterioration in morals and piety, and of the ruin of all your prospects for life, and of your soul in eternity. The darkness of night in an unknown region prompts a wise man to the practice of caution and vigilance.—Selected.

Buds.—Do not pluck those beautiful and fragrant buds, but let them expand into the full-blown flower. And why not? They are very beautiful and very fragrant, and if left to expand their fragrance will soon depart, their fresh tints will be lost, and the chilly wind of evening will scatter their leaves, or the noonday sun will destroy them. God often plucks the buds in the midst of their beauty and fragrance, before they expand and perish. We miss them from the parent stem, but still remember them only in that exquisite freshness in which they were taken from our gaze.

GEOGRAPHICAL ENIGMA.

I AM composed of 25 letters.
My 2, 1, 24, 18, 13, 10, 7 is a river in Michigan.
My 11, 16, 10, 25, 21 is a county in Canada.
My 3, 10, 15, 19, 61 is a city in Russia.
My 4, 32, 17, 8 is a river in New Jersey.
My 11, 14, 9, 12, 13 is a city in Asia.
My 14, 20, 33, 19, 7 is a river in North Carolina.
My 11, 14, 15, 7 is a body of water.
My 3, 30, 14, 24, 22, 6, 22, 5 are mountains in Asia.
My whole is a Proverb.
Allanburgh, C. W., 1853. Z. C. SPENCER.
Answer in two weeks.

For Moore's Rural New-Yorker.

ARITHMETICAL PROBLEM.

At what time between 12 and 1 o'clock will the hour and minute hands of a clock or watch have made equal acute angles with a line passing from 6 to 12—that is, the minute hand wanting as much of being up to 12 as the hour hand has passed beyond 12?
Harmony, Chant Co., N. Y., 1909. J. J. W.
Answer in two weeks.

ANSWERS TO ENIGMAS, &c., IN No. 490.

Answer to Miscellaneous Enigma.—Where can you always find sympathy? In the dictionary.
Answer to Geographical Enigma.—Go to the ant, thou sluggard; consider her ways and be wise.
Answer to Enigma.—Meeting.
Answer to Algebraical Problem.—50 geese, 1 sheep and 19 cows.

HOMES FOR ALL!

FOR SALE.
At \$1.25 per Acre, desirable FARMING LANDS in Western Virginia, Eastern Kentucky, and Middle Tennessee. Also, valuable Lands in Sullivan and Elk Counties, Penna., &c.

Apply to the AMERICAN EMIGRANT AND HOME-STEAD COMPANY, No. 146 Broadway, New York.

U. S. TENT AND FLAG MANUFACTORY,
Rochester, N. Y.
TENTS AND FLAGS to Rent, suitable for Agricultural Fairs, Military Encampments, Conferences, Camp Meetings, &c.

Having the entire stock of Tents formerly owned by R. O. Williams, with several new ones in addition, I am prepared to fill all orders the public may feel pleased to honor me with. Tents and Flags of every description made to order.
Address JAMES FIELD,
Box 101, Rochester, N. Y.

STONE YARDS FOR 1859.—RATHBUN & W. Y. MOORE have always on hand a good supply of Lumber, and Milling Stone, Cape Sills, Platforms, Steps, Posts, Well and Cistern Covers, Curbs, Pavings and Building Stone, Flagging, all sizes, Fire-proof Vauls, &c. They will contract for all Street Improvements, generally at home or abroad, and will order short notice, addressed to RATHBUN & W. Y. MOORE, 101 W. Water Street, Rochester, or to the subscriber, Pittsburgh St. Bridge, Rochester.

KIRBY'S AMERICAN
LITTLE BUFFALO HARVESTERS.

THE BEST COMBINED MOWERS AND REAPERS IN THE WORLD. Simplicity; durability; convenience; adaptation to all kinds of work and every variety of ground; light draft; low price; freedom from side draft, clogging, and pressure upon the horses' necks; portability; perfection of work—all these desirable features are combined in the above machine.

The American Harvester is a two horse machine capable of cutting from 10 to 15 acres of area, and from 12 to 15 acres of grain per day. The Little Buffalo Harvester is a one horse machine capable of cutting from 8 to 12 acres of area, and from 10 to 15 acres of grain per day.

PRICES AT FACTORY.
American Harvester as Mower, \$105 00
Combined, \$110 00
Little Buffalo Harvester as Mower, \$75 00
Combined, \$80 00

Manufactured by the BUFFALO AGRICULTURAL MACHINERY WORKS, BUFFALO, N. Y., and D. M. OSBORN & CO., Auburn, N. Y., and for sale by J. C. HARRIS & CO., Rochester, N. Y. A Catalogue containing full descriptions of the Machines with Testimonials, accounts of Trials, &c., may be had by applying to the Manufacturers or any of their Agents.

E. D. HALLOCK is authorized to receive orders for the above Machines, and they may be seen at his Agricultural Warerooms in Rochester.

L. SILLIMAN, Agent for Monroe County.

MANNY'S COMBINED
REAPER AND MOWER,
WITH WOODS' IMPROVEMENT.

For the Harvest of 1859.
The subscriber begs to inform the public that he continues to manufacture this popular machine, and pledges himself to produce an implement that will fully sustain its former reputation as the best combined reaper and mower ever introduced, and inferior to none, either as a Reaper or Mower.

It has had a steady and increasing popularity from the first, achieving a complete success in the first important trial at Geneva in 1857. It carried off the highest honors at the great National Field Trial at Syracuse in 1857; and amidst all the competition and trials of 1858, came out with more and better evidence of points of excellence than ever before.

The general principles peculiar to this machine, and upon which it is constructed, have proved so successful that there has been no attempt to change them.

The most effort during the last year has been to improve its mechanical construction, to make it stronger and more durable, and sustain its reputation as the leading and most perfect machine to the largest class of farmers in the country.

Warranted capable of cutting from 10 to 15 acres of grain or grass per day, in a workmanlike manner.

Price of Machine as herebefore, varies according to width of cut, and its adaptation in size and strength to different sections of the country, from \$125 to \$150, delivered here on the cars.

WOODS' MOWER.—
Patented February 22d, 1859.

During the six years I have been engaged in the manufacture of the Manny Combined Reaper and Mower, I have given much thought and attention to the construction of what I would be a great want of the Farmers—a lighter and cheaper machine expressly for mowing, than had yet been made.

And now, after the most thorough and repeated experiments and tests in every variety of soil, and in all kinds and in every condition of grass, I am prepared, with entire confidence, to offer to the farmers and dealers of the United States, the great desideratum in this department of Agricultural labor-saving machines—a Mower, superior to its capacity for good work to any hitherto introduced, of easy draft, light, cheap, and durable.

This machine I now offer as my latest invention, to meet a special want of farmers, and to place within the reach of all, a Mower that for practical working, cheapness and simplicity, will be without a rival.

Builds Two-Horse and One-Horse Mowers. The Two-Horse Mower weighs 435 lbs., and cuts a swath four feet wide (or more if specially ordered.) The One-Horse Mower weighs 300 lbs., and cuts a swath three and a half feet wide.

For a more full description of the Mower, reference is made to my Pamphlets, which will be furnished on application.—While our four-horse and two-horse Mowers are in the hands of the Farmers, we will furnish two extra guards, two extra sections, one wrench and oil can.

Warranted capable of cutting ten acres of grass per day in a workmanlike manner.

Price of Two Horse Mower, \$100 00
One-Horse Mower, \$70 00

Delivered here on the cars.
I continue as heretofore, and with greater success than at any previous time, the manufacture and sale of "Manny's Patent Combined Reaper and Mower with Wood's Improvement."

MOORE'S RURAL NEW-YORKER,
AN ORIGINAL WEEKLY
RURAL, LITERARY AND FAMILY NEWSPAPER.

CONDUCTED BY D. D. T. MOORE,
With an Able Corps of Assistants and Contributors.

THE RURAL NEW-YORKER is designed to be unsurpassed in Value, Purity, Usefulness and Variety of Contents, and unique and beautiful in Appearance. Its Conductor devotes his personal attention to the supervision of its various departments, and earnestly labors to render the Rural an eminently Reliable Guide on all the important Practical, Scientific and other Subjects intimately connected with the business of those whose interests it zealously advocates. It embraces more Agricultural, Horticultural, Scientific, Educational, Literary and News Matter, interspersed with appropriate and beautiful Engravings, than any other Journal,—rendering it the most complete AGRICULTURAL, LITERARY AND FAMILY NEWSPAPER in America.

AD communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

For Terms and other particulars, see last page.

INQUIRIES AND NOTES.

Hooks, or Haws.

Can you give me any information through the Rural about what is called Hooks, or Haws, a disease of the eye of cattle, not very common, I believe, but one with which I have already lost the benefit of one ox, and now have another affected in the same way? Some reliable remedy is very desirable.—T. B. H., Rosendale, Wis., 1859.

Cattle have a contrivance for cleansing the eye from annoying substances, termed the haw, a flat piece of cartilage, of a semi-circular form, situated within the corner of the eye. This portion of the eye is disposed to disease. The little portion of fleshy substance towards the inner edge of the cartilage, and the caruncle, or small fleshy body, placed at the corner of the eye to give a proper direction to the tears, take on inflammation from sympathy with the eye generally, or from injury, dust or gravel; they swell prodigiously, and the haw is protruded over the eye, and cannot return. Ulceration appears, and a fungus growth springs up. Every means should be adopted to save the haw, for the removal of it will torment the animal as long as he lives.

If the disease is connected with inflammation of the eye generally, it will subside with that inflammation, and this may be hastened by the application of a Goulard wash, or diluted tincture of opium. If it is a disease of the part itself, zinc lotion must be used (two grains of white vitriol dissolved in an ounce of water, and the vitriol gradually increased to four grains; the application of it continued as much as possible to the part, and the liquid not being suffered to get to the sound part of the eye.) When it loses its power, a lotion of corrosive sublimate may be adopted, first of half a grain to an ounce of water, and gradually increased to two grains.

If it becomes necessary to extirpate the part, the beast must be cast, (but this should not be done until it is known to be absolutely necessary.) Keep open the eye with the fingers; a crooked needle armed with strong silk, must be passed through the cartilage, by means of which the part may be drawn out as far as possible; and then, with a pair of crooked scissors, the haw may be neatly dissected out. If the ulceration extend to any of the parts behind, or to the neighboring tissues, they also must be removed. Considerable bleeding will probably follow the operation, and some inflammation of the neighboring parts; but they must be subdued by proper means. If fungus sprout, it must be touched with caustic; there is little danger attending the operation, if done carefully, but the unpracticed should employ a farrier, if possible.

A gentleman of Michigan wrote us, some time since, that honey and lard, equal parts, mixed and rubbed in the eye, will in almost every case effect a cure. Fomentation with warm water is recommended by another subscriber in the same State, who very justly condemns the brutal practice of removing the Haws from the first appearance of inflammation, as blindness is apt to follow.

Gas Lime.

Will you please inform the public whether refuse from gas works, such as has been used for purifying gas, and any benefit for agricultural purposes; and if so, how applied, and to what?—P. W. Oats, Johnstown, N. Y., 1859.

Gas lime, when fresh, is a mixture of sulphuret of calcium with carbonate of lime, and in some

eases it may contain small quantities of ammonia, but not enough to make it of any value on this account, and the small quantity it contains will be dissipated in drying. Fresh gas lime is considered by those who have given the matter particular attention, to be injurious to vegetation on account of the alkaline sulphuret of which it is in part composed. By exposure to the air the sulphuret of calcium speedily absorbs oxygen and becomes a sulphate of lime, or gypsum, in which condition it is valuable for clover or grass, or for any crop that would be benefited by plaster.

Wash for Outbuildings.

I WANT to know how to make a good, permanent whitewash for outside buildings and board fences.—A. LIND, Simcoe, C. W., 1859.

Wishing to know how to make a whitewash that is both durable and good, I thought the inquiry would perhaps be answered by you or your numerous correspondents. I have a fence inclosing about an acre of ground, a poultry house, and a small barn to whitewash, and I would like to have them appear well, and also the whitewash to last some time.—D. GETHART, Williamsport, Pa., 1859.

Take a barrel and slake it in carefully, with boiling water, half a bushel of fresh lime. Then fill the barrel two-thirds full of water, and add 1 bushel of hydraulic lime or water cement. Dissolve in water and add 3 pounds of sulphate of zinc, (white vitriol,) stirring the whole to incorporate it thoroughly. The wash should be of the consistency of thin paint, and may be laid on with a whitewash or other brush. The color is pale stone color—nearly white. If you wish it to be a low color add yellow ochre, 2 pounds in powder; if drab, add 4 pounds raw umber.

Another good wash is made as follows:—Slake lime with hot water, in a tub to keep in the steam. When dissolved, and in a half fluid state, pass it through a fine sieve. Take six quarts of this lime and one quart of clean rock salt for each gallon of water—the salt to be dissolved by boiling, and the impurities to be skimmed off. To five gallons of this mixture, (salt and lime,) add one pound of alum, half a pound of copperas, three-fourths of a pound of potash, (the last to be added gradually,) four quarts of fine sand, or hard wood ashes. Add coloring matter to suit the fancy.

A correspondent of the Country Gentleman gives the following:—One bushel unslaked lime; half a gallon salt; three pounds alum, powdered; three pounds saleratus. Mix and put in a tight barrel with one head out. If the lime is quite fresh, cold water—if not, then use hot water. Keep stirring while slaking, adding water as required, so as not to become dry at any time. If it heats dry it becomes lumpy, and must not be overflowed with water so as to prevent the slaking going on. Stir up well from the bottom. When finished it may be thick as mush. When to be applied by a brush, make the mixture the consistency of whitewash—about the thickness of cream. Apply the first coat very thoroughly, filling every crack or interstice between the bricks or in the boards. For wooden fences a second coat of the same material is all that is required. Those who desire to have some other color than white, can add coloring matter to taste.

For BRICK HOUSES.—For the second coat, add to the first named materials 12 pounds melted tallow, and mix as before. This coat is impervious to water—is brighter, looking clean longer than paint, and preserves the cement between the bricks better than paint.

THE OAT CROP.

MESSRS. POMEROY and MARSHALL, of Mobile, Alabama, write that they have perused with much profit our articles on Oats, as this is a crop to which they give particular attention, and in response to our appeal for information send the following in regard to Oat Culture at the South, and the varieties best adapted to Southern culture:

Oats flourish well on almost any kind of soil, if properly prepared and sown in due season. The quality of the land of course influences the product, and the greater its fertility the better the crops. Heavy manuring may be applied directly, as it cannot be to most other grain, without producing too great a growth of straw. Thorough and careful cultivation of the soil is not lost upon the oat crop. In favorable seasons, on well-tilled soils, with proper quantity and kind of fertilizers, sixty to eighty bushels per acre are produced, and cost of production does not exceed 15 to 18 cents per bushel.

In regard to quantity of seed required per acre, a difference of opinion prevails. Some think oats will tiller like wheat and rye; but the product of the side shoots is inferior, and it is better to sow sufficient seed to cover the ground—from three to five bushels are commonly sown, though some think two sufficient. On a rich soil we would sow four bushels; on poor land three would be a plentiful supply. Some varieties of oats require less seed than others.

Some varieties of oats require less seed than others.

PRINCE EDWARD ISLAND BLACK OATS.—These oats are a large heavy variety, grown in Prince Edward's Island, a small island in the British Province, situated in the Gulf of St. Lawrence; and they have proved a very superior variety for winter and early spring sowing, withstanding the coldest weather we have in this section; and being from three weeks to one month earlier, enables the planter to harvest his crop in season to plant the same land with other crops. They weigh from 5 to 7 lbs. more than the ordinary oat, and the large leaf-top makes it a superior variety for cutting in the milk state for forage. When properly cured, it is equal to the best fodder or hay, producing on our piney woods land from 2½ to 4 tons per acre of this superior forage. In harvesting, there is always seed enough falls to seed the ground again, and the same land can be planted with other crops, and the oats will come up in the fall and furnish another crop. Thus, once sowing will bring you crop after crop, until run out. No crop pays a better profit for the same investment and trouble.—This excellent variety was first introduced into this section some ten years ago, and its cultivation is increasing.

CALIFORNIA OATS.—Last season these remarkably heavy oats were introduced by us for the first time in this section. They far surpass any oat we have ever seen in size, weight, and yield. They are a white oat and will weigh from 40 to 50 lbs. per bushel, are thoroughly acclimated and have produced 125 bushels per acre. In California they have produced 125 bushels per acre. Sown from the first of January to May, about two-thirds usual quantity of seed. The following is the history of the origin and introduction of them, which is furnished us by the party who introduced them.—When in Napa Valley, California, during the spring and summer of 1854, a gentleman having heard much about a newly discovered oat, the incredulous tales about its enormous yield and height induced him, before starting home (in the spring of 1855,) to travel a considerable distance in search of the discoverer, who informed him that three years previously, in harvesting his wheat, the seed of which came from Chili, he found one bunch of oats the product of a single grain. Observing their great superiority to any ever seen by him before, he carefully preserved them and had sown them for three successive years; and though he came near losing them the first, they had that year produced 125 bushels to the acre. He would only part with a teaspoonful, which was sown in drills in the State of Georgia, in the memorable dry spring of 1855. Although affected much by drought, they yielded 2½ gallons. These were sown in 1856 (also a fatal year on oats, being very dry in the first part of the spring,) and eighteen bushels were gathered. In the spring of 1857, a portion of this eighteen bushels was sown on thin upland; lost considerably by allowing them to get too ripe, and harvested 388 bushels by measurement, which, by weight, would have been over 400 bushels, entirely free from smut and blasted heads. Their height, one to two feet higher than ordinary oats, and abundant yield. Their weight, and the superiority of their straw and fodder, and of their fertilizing qualities, will cause them to supersede all other varieties.

EGYPTIAN OAT.—This oat was imported into this country from Scotland. It sometimes weighs as high as 42 pounds to the bushel. It is a large white oat, and besides being the heaviest oat we have, my experience authorizes me to say that it is the hardiest also. Col. Croom, the President of the Alabama State Ag. Society gives his experience with this oat as follows:—"It is safer, both for a winter and volunteer crop, than any other oat which I have used, and quite as safe for a spring crop. It certainly, for a volunteer crop, adds much to its value, as these crops furnish fine grazing, usually from the middle of February until June; so that from a field of these oats, first, a valuable grain crop is obtained in June; next, grazing from native grass often till frost; and then four months' grazing from the volunteer crop, in the latter part of winter, and the entire spring sowing."

THE WESTERN BLACK AND WHITE OAT and the Northern White are suitable for spring sowing.

GREEN MOUNTAIN OATS.—M. GREGORY, of Orleans county sends us a short, plump, heavy white oat, a small package of which he received from Washington under the above name. Mr. G. says:—"these I have been endeavoring to increase, but owing to grasshoppers and other evils am not yet ready to supply 'Rural readers' with seed. I have sown six pecks this spring. They are a new variety to me, altogether, grow very rapidly and at the time they begin to head are some six inches higher than the common oat, and about the same at maturity. They ripen some ten days earlier than the common oat."

KETCHUM'S ONE-HORSE MOWER.

The above engraving represents Ketchum's One-Horse Mower, as now manufactured by Maj. R. L. Howard, of Buffalo, N. Y., in connection with Ketchum's Two-Horse Mower and Combined Machine. Ketchum's large Mower has long been a celebrated "institution" among farmers, by whom its inventor is regarded as a great benefactor, and if, as is claimed, this single machine includes all the best features and late improvements of the double one, it must prove a most valuable acquisition. It is thus described by the Manufacturer, and commended by the Press:

"This machine weighs about 450 lbs., cuts 3 feet 4 inches, is easily drawn by one horse, and capable of cutting from six to eight acres of grass per day. It combines all of the features of the larger machines, and has all of the late improvements. These valuable improvements consist of an improved guard-finger, lever and roller, by which the driver can raise the finger-bar at pleasure; a roller in the outer shoe, so that in reality the entire machine now runs on wheels, which wholly prevents any drag, and consequently much reduces the draft. The machine is warranted in every particular, or no sale. A trial of this machine took place at Columbus a short time since, of which the Ohio State Journal remarks, as follows:

"There was a trial in Capital Square, yesterday afternoon, of a beautiful one-horse mowing machine, on the

heavy clover which has already attained a height and thickness of growth unparalleled in this section of the State. It is well known that grass, before it ripens, or while in a green state, cuts easier with a common scythe than when stiff and ripe. Not so when a machine is used, for the knives, playing in the sheathes, are more liable to become clogged with the juicy, pliable stalk of unripe grass than the upright, hardened growth of hay. Nevertheless, the little machine, with a light lively horse attached, swept over the ground, and cut the heavy growth of grass with the greatest ease.—The machine used is Ketchum's patent, manufactured by R. L. Howard, at Buffalo, N. Y., and is warranted to cut from five to seven acres of grass per day.—Mr. Howard also manufactures Ketchum's Patent Grain and Grass Harvester—a large machine for both mowing and reaping, which will cut from ten to fifteen acres per day. A farmer who witnessed the machine operate in the State yard, was so well pleased that he immediately purchased one of Mr. Wm. Gill, the agent for their sale in this central portion of the State."

"The Buffalo Courier quotes the remarks of the Journal, and adds:—"Mr. Gill was a member of the Committee at the United States Trial at Syracuse in 1857, and, of course, witnessed the operation of the different machines which were tested at the time. Being strictly a practical man, it reflects credit upon and gives character to the Ketchum Machine, that he should have selected it from the many on exhibition, to sell and recommend to the farmers of his own State."

BUTTER MAKING.—PRIZE ESSAY.

[The following able and practical Essay on Butter Making is from the pen of our valued correspondent, PETER HATHAWAY, of Milan, Ohio. It is worthy the attention and study of all Rural readers interested, as its teachings are adapted to a wide range of latitude. We copy from advance sheets of the Annual Report of the Ohio State Board of Agriculture.—Ed.]

Preface.

SCATTERED over the State of Ohio, and forming an important division of the mixed husbandry which generally prevails in it, are very numerous small dairies, of from four to six, or ten cows each. From the surplus product of these small dairies, our market supply of butter is mainly derived. In the composition of this Essay, I shall write with special reference to these facts, and shall aim at practical results, rather than attempt a treatise which an amateur might pronounce perfect.

If correct and practical information, in the art of Butter Making, could be disseminated among all the managers of these small dairies, so as to attract and fix their attention, and bring their management into conformity therewith, who can doubt that the comfort of their homes would be improved, their pecuniary interests advanced, and a special favor conferred on all who partake of the product of their skill.

Having been, for the last thirty-three years, a practical farmer, and during that time connected with a Dairy, I have tested all that is contained in this Essay.

Best Breed of Cattle.

I think it may be "regarded as established," that, in selecting cows for a dairy, we may with success select cows for their individual character, without reference to any particular breed; that is, if the dairy alone is to determine the selection. It may be "regarded as established," that, while

the Short-horns, as a breed, are mainly adapted for beef, yet there are families and individuals of this breed, excellent for the dairy; and if a selection of such be carefully made they would give good satisfaction. It is said, that, in the London dairy establishments, nearly every cow is a Short-horn.—If, in the mixed husbandry associated with the dairy, beef is an object, then, by all means, select from the Short-horns.

The established character of the Devons is to yield milk in small quantity, but rich in quality; yet from this breed, as from the Durhams, individuals may be selected that are all the dairyman can expect, and some practical dairymen prefer them.

Of our native cows, it is on record that E. K. Evans, of Marcy, Oneida Co., N. Y., with five cows, selected from his native herd, made 217 pounds of butter, in thirty successive days; while George Vail, of Troy, in the same time, in competition for the New York State Premium, with five Short-horn cows, made 223 pounds. It may be "regarded as established," that, from native cows and crosses, individuals may be selected, that for dairy purposes are as good as the best.

The Ayrshires and Alderneys have established a famous reputation for the dairy, yet in Ohio they are not found abundant enough for the dairyman's selection.

On the whole, it appears clear, that, in selecting cows for the dairy, we need not be confined to any one breed, but may search for the best milkers, regardless of breed, being aware, however, that the quantity of milk does not always determine the quantity of butter. Of this, the churn or the lactometer should be the test.

Influence of Feed, Exercise and Shelter.

From whatever breed the selection is made, the dairywoman, who is required to make choice butter, may insist that the cows be healthy; that they

have access to good, sweet pasture in summer; that they have water at will, and that they are freely supplied with salt; and that, if excellent butter is still required after the pasture is injured by frost, that pumpkins and meal be added to their fare. I have observed, that, in seasons when soft corn abounds, and the cows are fed freely with it, that late fall butter may be made of excellent quality, little, if any, inferior to that made in the choicest part of the season.

The connection between the kind of food consumed by the cow, and the quality of the butter made from her milk, is as intimate as that between the food consumed by the bee, and the honey produced. Old fertile pastures of timothy, white clover, and June grass, or the aftermath of old intervals meadows, furnish a better pabulum for butter than fresh pastures of red clover. The last will be improved by a mixture of timothy, and the natural grasses. When the cows are fed on dry fodder, roots will increase the flow of milk; but for the production of excellent butter, experience has taught that grain is necessary. Indian meal, bran and shorts are good. For dry fodder, perhaps cornstalks are the best. It is very important that, in the winter, cows be kept in good condition, and not suffered to lose flesh, in view of both the quantity and quality of the butter made during the coming season.

Exercise is essential to the good health of all domestic animals. In summer, roaming the pasture secures it. In winter, such an arrangement of yards, straw-ricks and sheds, should be contrived, as will insure a sufficient amount of exercise at that season. It may be "regarded as established," that stables in winter are the best shelter, with yards for exercise in the day time; yet, for a small stock, and where the capital of the husbandman is inadequate for greater outlay, such an arrangement of ricks, sheds and board fence, may be devised, as will furnish very cozy and healthy wintering places for cows. The shelter of shade trees in summer should not be forgotten.

Dairy Salt.

The dairywoman should with all earnestness insist on being supplied with good salt, as poor salt will injure the very best made butter. Liverpool dairy salt, or the coarse solar salt made fine, are both excellent. If any doubts are entertained of the genuineness or fitness of the salt obtained, dissolve a little in a glass tumbler; if the brine formed is clear, the salt is good; if, on the contrary, it is of a milky appearance, it should be rejected.

Milking the Cows.

On the Western Reserve, (to their praise be it spoken,) mothers have taught the men to be careful of their wives and sisters; consequently the men almost invariably milk the cows. The mistress of the dairy should see that the milkers' hands are clean, and also the cows' udders at milking time. I would advise her to occasionally visit the milking yard, in order to superintend matters there. She should know the cows by name, together with the quantity and quality of each cow's milk, and should advocate tenderness and gentleness in that department. The milking yard ought not to be a place for scolding and blows, where harsh language may be heard daily, night and morning, but a quiet inclosure, where the cows may chew the cud in happy complacency, and where the thoughtful milker may peacefully think, or the merry one whistle or sing, while drawing the lactean stream. The milking yard should be a permanent inclosure, containing a pen for breaking heifers, and all fixtures necessary or convenient for the milking process; and as soon as the cows are milked, they should be turned into other inclosures for feeding or rest, so that the milking yard may be preserved sweet and clean, and but little trodden by their feet. I have been myself a milker of cows for more than thirty years, and I think it a scene worthy of a painter's eye, when a herd of beautiful, sleek and well-trained cows come orderly and quietly into the clean milking inclosure, each one taking her accustomed place, and evincing that confidence in man or maid, who may happen to be there, that proves established acquaintance and tried friendship between them.—There may be here, as well as in other scenes of the farmer's life, much of poetry, and those numberless small sources of contentment and delight, which are unhappily often missed where they might be enjoyed. Milking may be so managed as to be a pleasant relaxation from toil, rather than a hateful chore.

If, at any time, the milk pans exhibit a sediment proving a want of cleanliness in milking, the mistress of the dairy should have authority in the case, without appeal.

Dairy Apartment.

The dairy apartment should be cool, airy and clean. If a cellar is used, it should be plastered, whitewashed, have a stone or cement floor, be furnished with wire-grated windows, and be appropriated exclusively to milk, cream and butter. A dairy house built on the surface of the ground, scientifically constructed, and properly shaded, would doubtless be preferable to a cellar under ground; yet I do know that, all other things being right, very good butter may be made, in a good, well-ventilated cellar. Spring houses are out of the question, in very extensive localities, in our State.

Care of the Milk.

Immediately on the receipt of the milk in the house, let it be strained into six quart tin pans, and set on a long, narrow table, or on the floor of the dairy apartment, as the temperature of the season may indicate. For cleanliness and convenience, the table is preferable, but the floor may be used when the weather is very warm. A recent writer, whose essay has had a wide circulation in the columns of the New York Tribune advocates the use of tin pans, in preference to shallow pans, for setting the milk. I think his suggestion is not accompanied by sufficient experimental proof to change old established usage. The cream will doubtless rise more readily in shallow pans.

It may here, once for all, be written down, that great cleanliness must be observed ever and always in butter-making. The atmosphere, the table, the vessels, the floor, everything must be kept sweet and clean. The neat dairy woman will not allow dusty coats, muddy boots, or tobacco

odor, to come in close proximity to her butter bowl or milk table.

The time during which the milk should remain set, depends upon the temperature, natural or artificial, of the dairy apartment. Just long enough for all the cream to rise and no longer, is the rule, economically considered; yet if a sample of very choice butter is desired, regardless of economy, the cream may be skimmed off and churned sweet; this practice cannot be recommended as an ordinary one—it is wasteful. Again, if the cream is skimmed when the milk sours before it coagulates, or in the phrase of the dairy, becomes lobbard, choice butter may be made; but in order to obtain all the cream, it is necessary to wait till the milk coagulates. Very important is it that the cream be now removed before the milk and cream becomes wheyish; if this change occurs, good butter cannot be made. It is the want of skill and attention at this point, that causes much of the failure in making butter, in the practice of ordinary operators. The cream should now be stored in a stone crock; if it is to be kept till the next day, a small handful of salt added, and the mass stirred with a wooden spatula, kept for the purpose. When more cream is added on the succeeding day, the stirring may be repeated without further addition of salt. This process is to prevent the formation of whey. If the dairy is large enough, a daily churning will certainly be preferable; in that case put the cream in the churn as it is skimmed. In warm weather the churning should, in all cases, be performed as often as every other day.

Winter Care of Milk.

The winter care of milk differs somewhat from the above. On the approach of severe cold weather a dairy apartment should be provided, warmed in some way by artificial heat. The temperature of the room may be lower than will suffice to coagulate the milk. When the firm, leathery appearance of the cream, together with its thickness, indicates that it has all risen, an incision may be made in it with the skimmer, and by dexterously holding the cream back, the milk may be decanted from the cream expeditiously and without waste. The milk should not, at any time, stand longer than three days without skimming. The cream may now be stored in a cold apartment, and treated according to previous directions.

Churning.

The kind of churn I leave to the fancy of the operator. The kind I prefer is an upright cylindrical-shaped churn, made of oak; both extremities of the same size, and having a slight bilge, not in the middle as in a barrel, but swelling a few inches from the bottom. In such a churn the dash nearly fills the churn from top to bottom, excepting the slight bilge, and all the cream is continuously and uniformly agitated. The cream should be brought by cold or warm water surrounding it, or by such appliances as the ingenuity of the operator may devise, to the temperature of 62 deg. Fahrenheit, and at that temperature churned. I have known most excellent butter made by a skillful dairywoman, without other thermometer than a little of the cream taken on her finger and touched to her forehead. Experience has proved that such a stroke of the churn-dash as will bring the butter in about 30 minutes, makes the best butter. At a temperature of about 62 deg. Fahrenheit, from 50 to 60 strokes of the dash per minute will accomplish this result, if care is taken to strike the top of the cream and the bottom of the churn at every stroke. If the churn be filled so that the dash cannot strike the top of the cream, the operation can scarcely be accomplished at all. Rapid churning should be avoided at the commencement, though the motion may be accelerated after the cream curdles with butter. The butter, when sufficiently gathered by churning, should be transferred with a wooden ladle to a wooden bowl.

Working the Butter.

Language, here, ceases to be adequate to the theme. Who can, with the pen, teach a young lady to spin? Who can, by language alone, describe the peculiar feel in handling cattle? Who can find letters to spell that sound used in driving horses, the nearest word to which is chirrup? In like manner, who can give adequate directions for working butter? The writer who can do it will certainly deserve a premium larger than any yet offered. A mother's counsel, precept and example, conjoined with one's own experience and practice, are the best means by which this knowledge can be transferred. Yet the skeleton outline may be given.

The amateur dairy mistress is very particular in the selection of her ladle—it must be delicate and artistic in its curve, light, thin and strong, as every gentleman knows who has endeavored to purchase ladles for such a wife, bringing them home and seeing them cast aside as unworthy of her hand, until the right one was procured.

After the butter is taken from the churn, it should be skillfully worked until nearly all the buttermilk is out of it. And here arises the mooted question, whether cold water should be used in the process; whether the butter may be washed? My decision is, that if the temperature of the dairy apartment is under the control of the operator, so that a low degree can be secured in warm weather, that working out the buttermilk without water will insure the most exquisite excellence as its result. But the buttermilk must be expelled at all events; and under ordinary surroundings, and with ordinary appliances, a free use of cold water will more certainly and speedily accomplish this object than any other means; and all other things being right, water-washed butter will be very good—perhaps I might venture to say, good enough. The keeping quality of butter without washing, is thought by many to be the best. I have for years visited at the houses of two highly intelligent and experienced dairywomen, both famous, in their respective neighborhoods, for the excellence of their butter. One of them, who has obtained premiums at public exhibitions for the best butter, and who has supplied numerous regular customers, to their entire satisfaction, with crocks of choice butter for winter keeping, is a warm advocate for the free use of cold water in extracting the buttermilk, and she assures me that the good keeping properties of her butter have been fully tested. The other lady, whose numerous customers are always ready to attest the superior excellence of the butter made by her over

that of ordinary sale, will not allow cold water to come in contact with cream or butter, except in extreme cases of oily softness. I have often eaten butter at their houses, and my judgment is that the unwashed butter is slightly superior in delicate aroma and marrowy sweetness; yet to distinguish the difference, the taste must be set fine and the attention concentrated on the trial.

When the buttermilk is pretty well worked out, such a quantity of salt should be added as suits the tastes of those who are to be its consumers. Tastes vary greatly on this head. The habits of some sections require more salt than others. Some directions give seven-eighths of an ounce of salt to a pound of butter as a rule. Let the salt be thoroughly incorporated with the butter at its first working. The butter must be subjected on the ensuing day to a second working; these two may suffice for present consumption, but for butter, intended to be long kept, a third working on the third day will be necessary. Experience and practice can alone enable the operator to work the butter skillfully, so as to completely exclude the buttermilk, without rendering the butter salvy. A machine called a butter-worker will very much aid in the second and third workings. It is to be remembered that butter will keep, and that buttermilk will not—conjoined, they will certainly spoil.

Final Packing.

For keeping butter, for family or neighborhood use, I know of no vessel preferable to stone crocks, containing two or three gallons each. In these crocks pack the butter in layers of such thickness as will be convenient for use, sprinkling a little salt between each layer; this sprinkling of salt is for convenience in extracting the butter for use.—Continue until the crock is nearly full; then cover with a fine muslin cloth, on which place a layer of salt half an inch thick; then fill with strong brine, and cover with a stone cover, and the work is done.

If the directions given in this essay are followed with the skill and tact of practice, butter may at any time be extracted from salt crock, that good judges will pronounce A No. 1.

Even inferior butter may be long kept unchanged, if it be kept cold, and the air entirely excluded. I once, in very warm weather, suspended a package of once worked butter in a deep well; through accident it fell to the bottom. Several years after, on cleaning out the well, it was recovered, and on scraping away the dirt which had gathered on the surface, the butter proved to be unchanged in quality. From this fact, a hint may be derived that to keep it cold and exclude the air, will aid in preserving the good qualities of packed butter.

Condensed Correspondence.

"WHAT AILED THE STEER?"—In the spring of '58, I had an ox sickened and die in a very short time. At first he appeared in great distress, and commenced bloating. I took him from the stable, tied him to the fence, in order to try and do something for him, and in his writhings he jammed over the fence, fell, and died immediately. He was bloated as full as possible. In dressing, we found, to all appearance, that no food had passed his "paunch" for the previous 24 hours, perhaps longer, but all that he had eaten had lodged in said organ, and appeared to be harder than usual. Now, I wish some RURAL reader would inform me what the disease was. I can find nothing in any books that will touch the case. Some of our neighbors call it "Dry Murrain." I wish also to know the remedy—and if anything could be of any avail. He died too soon to have anything take effect, unless it would act immediately—was dead in about twenty minutes after I found he was sick. I had been feeding some grain all winter, and he was in good flesh.—T. P. H., Farmington, Mich., 1859.

WHERE SHOULD BEES BE KEPT?—We recollect reading in the *Genesee Farmer*, about fifteen years ago, an article detailing success in bee-keeping, in which the writer recounted an experiment of keeping bees in the garret of his house. He claimed that the plan was possessed of many advantages, which, judging from what we know of the instincts of the bee, we should consider true. The bee when left to select its own abode, fails not to locate it as high from the ground as possible. In this practice very many different species of bees and wasps join, although some species build upon the ground, and some even in the ground. We would recommend the trial of the experiment, believing it may result in adding valuable knowledge to our present fund of bee literature.—G., *Out West*, '59.

CULTURE OF ONIONS.—Last fall I noticed an article on the cultivation of onions, the manner of which I thought was not the best. Now, the best mode of doing things is what we want to know.—As far as my experience goes, I will tell RURAL readers how they may raise good onions every time they try. Onions require a dry soil. Manure well, plow deep, level off with rake or harrow, and here comes the secret in cultivating: Make the ground hard on the top by stamping or rolling, loosen the surface so as to plant your seed in drills half-inch deep, and one foot apart. Keep free from weeds, and all the scullions you have next fall you can eat at one mess.—S. A. C., *Smyrna, N. Y.*, '59.

TO KEEP EGGS FRESH.—Here is a recipe that I am informed will keep eggs sound one year. I presume it will do it; but I wish to be positive, as I expect to lay down a large quantity the coming summer, if I can obtain a reliable recipe.—Boil one pound of salt and one ounce of salt-petre for ten minutes in five quarts of water. When nearly cold add four tablespoonfuls of good lime. Keep them in a cool place. Will some of your correspondents inform me with reference to the foregoing, or give me another recipe that will answer the purpose, and much oblige.—A SUBSCRIBER, *Bronte, C. W.*

TO CURE HOLLOW HORN.—We are receiving much profit from the columns of the RURAL, and would cast in our mite for the general good, by giving a sure remedy for the cure of hollow horn, or horn-ail, in cattle.—Dissolve a tablespoonful of copperas in warm water, and mix with the creature's mess, if it is not past eating, if it should be, pour it down. This dose will seldom need to be given more than once. It has been our remedy for many years in a large dairy.—E. J. STANCLIFF, *North Collins, N. Y.*

Rural Spirit of the Press.

Large vs. Small Horses.

Our readers all know with what favor large-sized horses have been viewed by English farmers, and have read concerning the many experiments made to combine great bulk with perfection of movement and economy in keeping. The following article, from an English exchange, would seem to indicate a change of opinion and a seeking for good qualities only in medium-sized animals:—One of the principal mistakes of the present age has been the enhanced value set upon horses of great size. There is a standard of excellence which governs the size of all animals; those most essentially which are required for labor. It is often remarked that "a good big horse is superior to a little one." In theory it appears to be a just conclusion, but practice inquires "where the good big one is to be met with?" There is likewise something more than power requisite to complete a good horse; that is, the will to give effect to the power. This excellent faculty is derived from the nervous excitability of the brain and nervous system, which influences the muscles of locomotion; and when this property exists extensively, unless it be counterbalanced by some physical inability, ill health, or want of sufficient nutriment, the animal will possess equivalent good qualities. When the relative proportion of horses and mares is studied, it will be found that the horse is naturally of greater size; it is, therefore, by all means desirable to seek for mares of the largest frame. Nature is an excellent monitor on such occasions, and does not suffer her ordinations to be transgressed with impunity. Any oversized mare is very uncertain in her produce; one year she will give birth to a puny, weak, leggy foal, and the succeeding one will, in all probability, be too bulky, inactive, and clumsy.

Ravages of the Turnip Fly.

MANY devices have been recommended against the attacks of the Turnip Fly, but no absolute specific appears as yet to have been discovered.—Mr. Poppr's scheme for escaping it consists in sowing alternate rows, or occasional patches of common turnips in the midst of the Swedes, in the belief, to which his experience had led him, that the fly would confine itself to the former. He has since found that mustard attracts the fly from both common and Swedish turnips. Mr. Garx, of Dilston, Eng., has for some years planted field potatoes in rows alternately with Swedish turnips, on land which had been worked, manured, and drilled up in the previous autumn, or very early in the spring, the potato seed being put in with the spade. This he did to preserve the potatoes from the prevalent disease; and the turnips were always the best in the field. Lord Garx states his experience of the same practice thus:—"It is a curious thing that in one field, when I have tried your experiment of sowing two drills of turnips together between the drills of potatoes, the turnips have entirely escaped the fly, though in all the rest of the field, sown at the same time, they are completely destroyed." It would seem that the potato top is so distasteful to the fly, as to afford protection to plants of another kind growing in immediate proximity. Still another method has been furnished the *Canadian Agriculturist* by a Canadian farmer who has had considerable experience in raising turnips, and has never wholly lost his crop by the attacks of the fly—and seldom indeed much injured. His practice is to sow very thickly, and as soon as the smooth leaves begin to appear, to scatter over the drills a quantity of quick-lime, dry wood ashes, and soot, intimately mixed; the proportion of lime being equal to the other two ingredients.

About Feeding Pigs.

One of the Marietta, Ohio, farmers writes to the *Cultivator* upon this subject as follows:—"Persons who have had much experience in rearing swine, have noticed the woe-begone appearance of young pigs, suddenly deprived of nature's first food. Few persons, indeed, know how to wean pigs. I give you my experience for the benefit of the *Cultivator* circle. Provide yourself with troughs made of boards one foot in width, five feet long, with sides but two to three inches high. The idea is, to provide a trough that will be accessible to pigs as well as the sow. Each sow and litter, for manifold reasons, should have separate pens and ranges. Feed the sow sparingly for the first three or four days after farrowing. Afterward she should be fed in the shape of slops, all she can eat. *It will pay*, rest assured of it, reader. At the end of four weeks the pigs will take to the well-prepared slops, and consequently will gain faster and draw less heavily on the dam. At the end of seven or eight weeks, pigs thus fed, will look as Farmer Thrifty's should, and can be taken from the dam without injury, continuing, of course, to feed nourishing slops. In this connection I must tell you how I fix my swill barrel to keep the contents warm in cold weather:—I dig a hole 18 inches deep, and 10 or 11 feet in diameter, fill it 18 inches with fresh manure, warm from the stable, set the barrel in the middle of the heap, and pile manure around it as high as its top, cover with two or three inches of dirt and the work is done. Your pigs will compensate you for this labor by laying on flesh even in cold weather."

Corn Fodder.

SAYS the editor of the *New Hampshire Journal of Agriculture*, "let every farmer keep a load or two of fine manure to use for raising a patch of corn to cut up green in the fall. Those who have never tried it are not aware how much may be raised per square rod. After your planting is finished and you get breath a little, plow up a small patch (plow deep,) harrow well, and with a common plow furrow one way two feet and a half apart.—Scatter in your manure an inch deep—scatter in your corn—at the rate of thirty or forty kernels to the foot and cover it up. When up about a foot high, go through with a plow and turn a furrow against each side of the corn, sufficient to cover weeds. The corn will soon have the mastery and no weeds will appear. When feed begins to fail, begin on the corn, and if your cows get it, they will tell of it in the milk pail, and if you have a large dairy a few more pans will be needed. Some prefer the large sweet corn. Some of both kinds may be sown and then see which is the best."

Agricultural Miscellany.

THIS FROST.—Its Range and Effects.—Since our last, numerous letters and exchanges have furnished us accounts of the wide range and effects of the severe frost of June 4th. Many of the reports are conflicting, and it is impossible to arrive at any definite conclusion as to the extent of the actual damage, though it has no doubt been so great in some sections as to render the June Frost of 1859 memorable in the annals of Summer temperature. The frost seems to have prevailed over a wide extent of country, though, from the accounts received, the greatest damage occurred in Southern and Western New York, Northern and Western Pennsylvania, Northern Ohio, Wisconsin, and Canada. From various localities of the sections named we have mournful accounts of loss, many of which aver that the wheat is destroyed. This may be true to some extent, but we think the cereal crops have generally escaped, and that the general average will not be materially diminished, (taking the whole country together, and considering that the frost has been beneficial in destroying insects.) True, the first reports from various sections stated that wheat, rye, &c., were entirely destroyed—yet later accounts indicate that the extent of the injury was greatly exaggerated.

Corn, potatoes, garden vegetables, &c., were injured or destroyed to a considerable extent in portions of New York, Pennsylvania, Ohio, Michigan, Illinois, Wisconsin and Iowa; but, though untimely, the frost was not so late in the season as to prevent replanting, or substituting other crops, with the prospect of fair yield. Fruit has also been destroyed in some localities, yet we think the damage is not extensive. Viewed in the most favorable light, however, the frost has proved a great calamity, and calls for the exercise of patience and resignation—remembering the promise of "seed time and harvest"—as well as industry and wise and prompt action in replanting crops destroyed, or substituting such as will be likely to prove most remunerative. The much labor is lost, if all affected act promptly and prudently, the calamity will be overcome, and the country speedily recover from its effects.

—Another frost occurred on Friday night (June 10th,) which was somewhat destructive to tender vegetation, but so far as ascertained the damage was comparatively trifling in this vicinity.

SEASON AND CROPS IN NEW ENGLAND.—Our New England exchanges speak very favorably of the season and crop prospects thus far. The *N. E. Farmer* of the 11th inst. says:—"The promise is at present strong for abundant crops. The hot days which we had about the middle of May brought the plants forward with great rapidity,—but the cooler weather since has given them a desirable check, so that they have grown stocky and strong, instead of aspiring to reach the skies. The apple blossom has been full in this region. The cherry blossom only moderate, while we have met only two farmers who have seen a peach blossom this spring! A copious rain fell here on the night of the 31st of May, and the ground is well wet below,—so that if little or no rain should fall before haying, the grass crop will be an average one. Hay still commands a somewhat high price, however, in consequence, we suppose, of the high price of grain, as it brings readily in our market from \$1.00 to \$1.15 per hundred pounds, according to its quality. Planting was somewhat delayed by the northeast storm which occurred in the last half of May; but the crops were got in seasonably, notwithstanding, and the grain crops are up and appearing well. Corn has come up promptly, and looks well, and so do many fields of potatoes. Winter rye and winter wheat are of good height and due color, and have a fine start for rich harvests. Spring wheat also looks well."

RATS TAKE THE CORN.—Illinois papers say that some sections of that State are greatly troubled with rats, and the plague begins to look as formidable as any of those which overran Egypt. The animals have increased to such an extent, it is said, that large corn-fields are entirely ruined by their burrowing in the soil and eating the kernels, even after they have germinated and the plant obtained some growth. One farmer near Pontiac mixed corn with arsenic and spread it on the field. The result was a general destruction of the rats, six wagon loads of the dead vermin having been removed, 150 out of one hole! These stories are rather huge, but are probably partially true. The people of Logan county have felt constrained to offer \$100 in premiums to be paid at next County Fair—\$50 for the largest number of rats killed, \$50 for the second, and \$20 for the third. Under this stimulus it is said one man has already killed nearly a thousand of the depredators.

WESTERN NEW YORK CO. INDIA.—A letter just received from a friend in India (dated Singapore, March 29,) says:—"I might write to you of wide, smooth roads lined with bamboo hedges, interspersed with acacia trees—of fields covered with the sensitive plant—of groves of nutmeg and palm trees—of the coco-nut, clove and chocolate tree—of the mango, and the mango-goose so white and delicate—of the Jack and bread fruit, &c., but fear I should not write understandingly, or so as to give you any definite idea. We have all heard somewhat about 'India's coral strand,' and 'air perfumed with spices'—of delicious fruits and magnificent flowers, &c.,—but one whiff of old Ontario's breeze—one good-sized pebble on Genesee's shore—one good Bartlett pear, or ripe peach, with the thermometer somewhat below toasting heat, would be a luxury."

THE PRIZE ESSAY ON BUTTER MAKING, published in preceding columns, is a model in its way—being practical, brief, and withal so comprehensive as to include every branch of the subject. In our remarks on first page, we ought to have stated that the Essay was written in competition for a Premium of Fifty Dollars, offered by the Ohio State Board of Agriculture in the following terms:—"For the best Essay on Butter Making.—This essay is expected to embrace whatsoever may be regarded as established respecting the adaptation of different breeds of cattle for butter making, with influence of feed, exercise and shelter, and the whole process and rationale in making and curing."

NOTES ON EUROPEAN AGRICULTURE.—We have the pleasure of announcing that a series of Letters on European Agriculture will appear in the second half of this volume of the RURAL, commencing with July. They will be contributed by SARGENT HOWARD, Esq., of Boston, who is so widely and favorably known as a sound, practical man, and able writer on agricultural subjects, that the simple announcement of his name is a sufficient guarantee that the letters will attract attention and prove interesting and instructive to thousands of our readers. Mr. H. is now in Europe, and we hope to receive an instalment of his Notes in time for the first number of our new half volume, July 2d.

THE PAPER WEIGHTS, made of Grand Rapids Gypsum, cut and polished, and kindly sent us by Mr. N. S. HAMMOND, of the Mich. Central Nurseries, near St. Johns, Mich., are very beautiful and especially appropriate for the RURAL sanctum. They are both useful and ornamental—keeping papers in their places, and being much admired by friends.

HORTICULTURAL.

FRUIT CULTURE—ITS DIFFICULTIES.

THE opinion is becoming quite general that our springs are colder and more variable, and the fruit crop far less certain, than in former years. There is a disposition, we know, to magnify the evils we are compelled to endure, and to think too lightly of our greatest though common blessings; and we might, as some have done, moralize on this point, and endeavor to show that this evil of which there is much complaint, is not real but imaginary, and that there has been no change. We despair, however, of being able to convince our peach-growers, ably as we might reason. In former years, as regular as the season came round, they sold hundreds and thousands of baskets of luscious fruit, and gathered in the golden harvest. It would be hard to convince them that the vacuum in their unused peach baskets, and in their pockets, is not real but imaginary; or that the almost leafless, dying trees are as healthy and vigorous as they were ten years since. In 1850, one of our largest and most experienced fruit growers declared that in over twenty years' experience he had known but two failures of the peach crop. Now, we are sorry to say, a good crop seems to be the exception. And this result cannot be attributed to want of care, or to the age of the trees—for we believe as much care is given them as at any other time, and our farmers and fruit growers have continued to plant with the greatest courage and perseverance. More peach trees were planted within 20 miles of Rochester in 1857-8, than in any two years since the settlement of the country. That our seasons in Western New York are far less favorable than in former years to the more tender fruits, as the Peach, Apricot, &c., we cannot doubt; and may we not hope for a change for the better, before long? Some persons, we know, assign causes for the change, such as the destruction of forests, &c., which would preclude a hope; but a similar change has been experienced in some parts of Europe, where this cannot be the cause.

The seasons are beyond our control, but there are other things lessening our fruit crop in a fearful degree, and which must be charged to the carelessness of cultivators. The principal of these is the rapid increase of insects. With the increase of fruit culture, which furnishes them the means of subsistence and propagation, the fruit-loving and fruit-destroying insects have increased in a four-fold ratio, until almost every apple orchard is swarming with caterpillars, bark lice, &c., the luscious plum and the apricot are banished from the garden by the curculio, the currant, that everybody supposed could be grown in any out-of-the-way corner, uncared for, is eaten by the gooseberry fly-grub, the garden disfigured by its bare limbs, and every hill of melons swarms with flies, striped bugs and squash bugs, and fortunate or persevering is he who saves a single plant from their ravages.—Here and there a cultivator has been diligent to destroy injurious insects, but as a general rule they have been allowed to increase unmolested, until they have over-run our orchards and gardens. We need plain talk and prompt, thorough action, on this subject. Every one should not only attend to his own garden and orchard, but urge upon all his neighbors a similar course of action, for a few cannot arrest this evil. It should be made the subject of discussion in every farmer's club, in every neighborhood and in every farm house; and every one should be zealous to set a good example to his neighbors.

It is useless to wait for any patent remedy, any Paxon gun that will annihilate an army of insects at one discharge. Untiring watchfulness and diligence is the price of success in this work. The best of remedies will fail if not faithfully and repeatedly applied. Wage a war of extermination, and if one thing fails, which you supposed to be rare as well as certain, try another that you know to be certain, though more difficult; catching and killing is sure death in all cases.

The past winter was unusually warm, with the exception of two or three days. The buds were swollen and tender, when a degree of cold that in ordinary seasons would be productive of no evil, killed the peach buds and injured many half-tender things. The spring was mild and forward, and all flowering shrubs and trees were in bloom two weeks earlier than last season. Corn, beans, cucumbers, melons, &c., were planted as a general thing quite early, and up to June 4th everything seemed favorable for an abundant crop. On the evening of that day, however, it became quite apparent that we were to be visited by a frost, and means were taken by a few for protection, by spreading mats, sheets, &c., over their plants, by which many were saved from material injury. In gardens unprotected, corn and potatoes were injured, but not destroyed, melons, cucumbers, beans, tomatoes, &c., mostly killed. Since that time the weather has been cold and windy, with occasionally a cold rain storm, and last night, (the 10th,) there was a slight frost. The grape vines have suffered in many places, the tender shoots being killed. The apple and pear trees have been thinned of their fruit,—the older and more matured specimens have received no injury, but the smaller and more immature fruits are falling from the trees. It seems that all that had arrived at a certain stage of growth, were hardy enough to withstand the frost. Perhaps enough will be left for a good crop.

The past winter and spring in England was in many respects very similar. The *Florist* and *Farmer* of May, says

"The extraordinary vicissitudes of our English climate have never within our memory been so grievously realized as in the present season. After the frosts which occurred at the end of November, we have had no winter to speak of; indeed, December, January, February and March were remarkable for unusual mildness, and this, too, accompanied with a high barometer and the absence of rain in

PROTECTION OF FRUIT TREES FROM SPRING FROSTS.

many localities. Our last English winter, in fact, might have answered for the South of Italy, by its immunity from frost, and generally clear, bright weather. Very early in February, a number of shrubs were fast breaking into leaf, and Apricots opening their blossoms; during March all went on unchecked, so much so, that by the beginning of April, notwithstanding the severe frost of March 30 and 31, the woodlands and pasture grounds presented all the appearances usually shown by the first week in May, and every description of garden produce partook also of the general earliness of the season. On the 31st of March we had 10° of frost, which, following after a snow the previous evening, did a vast amount of mischief to such fruit trees in bloom, besides destroying in several places the crops of Apricots, which were then of a considerable size. Peaches had partly set, and suffered more or less throughout the country; and early Pears and Plums also. The weather became warmer, and the 4th, 5th, 6th and 7th of April were remarkable for their great heat, the day temperature having been 88° in this neighborhood on the 7th, and between 70° and 80° the greater part of the former three days, an extraordinary temperature for the first week of April, and exceeding by a few degrees the two or three hot days occurring later in the month of April, 1858. The weather next became sensibly colder, and on the 14th and following days, indications of winter made their appearance, followed by snow storms, cold north-west winds, and frosty nights. On the morning of the 20th we had 8° of frost, accompanied by an easterly wind; this frost has almost completed the ruin of our crops of Pears, Plums and Cherries, excepting perhaps those in some favored locality, or which had ample protection, a thing almost impossible to effect within the means of an ordinary garden expenditure, to say nothing of orchards and open garden fruits."

To remedy the vicissitudes of the climate, and the consequent uncertainty of the fruit crop, Orchard Houses are being very rapidly built, and are becoming a substitute for the old brick walls. These we have before described, but like grape houses, and all glass structures, they are expensive, and this will prevent their general adoption in this country, if not in England. The *Florist* proposes a plan "to ensure crops of fruit without the assistance of glass," which the following description and engraving will make plain:

"To render our meaning clear, we will take a south wall, cropped, say with Peaches and Apricots; take the wall 14 feet high, and the border at 14 feet wide. Let the soil the whole width be duly prepared for fruit trees, as it generally is near the wall for the Peaches. We would then throw an arched trellis, springing two feet from the ground at front over the border, to within five or six feet of the wall, under which we would plant other kinds of fruit trees for covering the trellis, say the best kinds of Pears and Plums on south aspects; Cherries, Plums and Pears on east and west borders; and Warrington Gooseberries and late Currants on north aspects. The accompanying diagram represents the wall and trellis, and will help to show the plan of protection recommended. When it is wished to put on the protecting material, the upright (a) which, however, may be permanent, should be set up, to hold the front horizontal bar, and strips of wood, iron bars, or even cordage, run up every eight or ten feet from the front horizontal bar to the one under the coping (g). If the strips are not considered sufficiently strong to sustain the covering, wooden uprights may be substituted as a support for the tie (h)."

The whole of the frame and supports (a, f, h, i) can be easily put up and removed, and may be used when the fruit wants protection in the autumn, equally when the bloom requires it in the spring. It now remains to notice the best material for protecting the bloom; this should be so arranged on rollers as to draw up to the coping (g) when not wanted. Woollen netting is perhaps the best known protection against frost; but, as it is necessary that the bloom be kept dry if possible, a thin waterproof material is yet wanted, manufactured sufficiently thin and light not to be inconvenient in drawing up and letting down, and yet impervious to rain. We hope manufacturers will try what can be done towards supplying this deficiency in horticultural materials. In the mean time Shaw's Tiffany, or Brown's Shading, dipped in oil and dried, would answer the purpose of excluding damp and a great deal of rain, and would last for a number of years, substituting netting for the autumn, when birds, wasps, &c., only are to be kept from the fruit. When new gardens or new walls are in course of formation, we see no difficulty in the matter; and we are very strongly impressed with the conviction that a concentration of our best varieties of fruit trees, so as to admit of an entire covering when necessary, will be found as sound in practice as it will in the end prove to be economical when glass cannot be afforded."

STRAWBERRIES.

Messrs. Editors:—I notice in the *RURAL* of June 16th an article signed I. W. Briggs, in favor of the *Wilson Seedling*. In your remarks it is intimated that if the *Wilson* had been subjected to the same treatment as *Hovey's Seedling* and the *Early Scarlet*, its fruit would have presented a similar appearance. I do not assert the contrary, but desiring that the relative merits of these varieties may be fairly placed before the public, and admitting at the same time that one experiment in one locality may not afford conclusive evidence, I submit the following facts.

In the Spring of 1856 M. QUINBY, of St. Johnsville, procured a number of each of the above named varieties. They were set in the same plot of ground, tended by the same person, and cultivated with the same care. Very soon after planting the *Wilson* exhibited a more vigorous and healthy growth, but it was not until the following summer that its greater excellence became fully manifest. Then its vast superiority in size and quantity of fruit became strikingly apparent. Not only were the berries, on an average, full one-half larger, but the quantity by measure was three or four times as great. In flavor this berry is considered, by many, quite equal to either *Hovey's Seedling* or *Early Scarlet*, and it is certainly not inferior as a market fruit.

St. Johnsville, N. Y., June, 1859.

REMARKS.—It was not our intention to say aught against the productiveness of the *Wilson Seedling*, but to prevent our readers from getting the erroneous idea, which was conveyed in the article, that the old and neglected beds would have been productive, had they been composed of the *Wilson* instead of the *Hovey* and *Early Scarlet*. We have never seen the *Wilson* grown as large as the *Hovey*. Last season we expressed our opinion of its merits as follows, and have no reason yet for changing a word:—"Wilson's Albany thus far proves to be exceedingly productive—indeed, we know of nothing like it. The fruit is borne in immense clusters, on a very strong fruit-stalk, but still not strong enough to bear up the extraordinary weight of fruit. The plant grows with great vigor. The fruit is from medium to large, and irregular in form. It cannot be considered high flavored, but is a pleasant mixture of sweet and acid."

Inquiries and Answers.

STRAWBERRIES DRYING UP.—Can you, or some of your numerous readers, tell me what will prevent strawberry plants from drying up and dying? Last fall I got some plants and set them out. Under them in holes I put horse manure and leached ashes, and this spring they all withered up and died. I got some more and they are dying the same. Now, can you tell me what to do for them and oblige—A. CONSTANT READER, Centerville, 1859.

The ashes and manure, we suppose, killed your plants. Neither strong manure nor ashes should touch the roots of plants. The manure should be thoroughly incorporated with the soil before planting, or else, spread on the surface afterwards, to be forked in at the time of hoeing.

PRUNING A WINTER-KILLED GRAPE VINE.—Either yourself, or some of your correspondents, perhaps, will be kind enough to inform me what course I should adopt with my grape vines, which are partially winter-killed. They are apparently dead from the lowest main branch, excepting here and there a bud just broken open near the bottom of the canes, but from thence to the top of them, not the least signs of vitality. Should I cut away all the dead parts, or what process should I pursue? The vines are trained on trellises against the southeast of the wood-house, and grew last year very luxuriantly. My neighbors have vines exposed to all aspects without showing any injury.—J. T., South Bristol, N. Y., 1859.

Your object must be to remove all the dead wood and lay in a stock of live as rapidly as possible.—How this can best be done, we cannot tell without knowing more of the condition of the vine, the way in which it is trained, &c.

STRAWBERRIES.—Will you please inform the best method of raising strawberries? Is it best to keep the runners cut and the plants cultivated, or the whole bed in a mass of vines, thus shading the fruit?—EUGENE, Wisconsin, 1859.

Do we wish to grow berries of extra size we would grow strawberries by single plants, at least a foot apart, removing the runners and mulching the ground. To produce the greatest quantity, however, it would be best to allow the plants to run into rows, say two feet wide, and with a foot of space about a foot wide between the rows. Keep the weeds destroyed, and thin out, so as not to allow the plants to grow within three inches of each other. After the third year, after fruiting, dig under the center of the rows a foot and a-half wide, leaving a few plants on the edge of the rows, to

throw out runners for the next year's crop. That which was the center of the rows will now become the open space between the rows, and that which was the open space before, (after being forked up,) will be covered with plants. This process may be repeated from year to year, giving a good coating of well-rotted manure every time the plants are dug under.

DEGENERATION OF FLOWERS.—Will you, or some of the readers of the *RURAL*, please inform me how to preserve flowers double? I have several times obtained seeds from the East and different places. The first year the flowers are beautiful and very double, but after that the seeds from those produce single flowers, particularly the annuals. Double Hollyhocks and even my White Peonies have dwindled down to half their former size. They are planted in a rich soil, and I think they have very good care.—A. W., Lake Mills, Wis.

Good culture, and care in preserving seed from the finest flowers is the only means to prevent degeneration. Where plants are designed for seed, remove the side-branches and allow only a few of the finest flowers to form seed. It is almost impossible, however, to obtain good seed of some varieties of flowers in this country, and this is particularly the case with *Asters*. The finest *Balsams* give but few seeds, and must be watched, or these will be lost. *Hollyhocks* and *Peonies* do not produce their like from seed, and therefore plants raised from seed by ordinary care are apt to be inferior. The *Hollyhock* should be divided and replanted, when a good flower is obtained, for the old plant dies after the third year.

EGG PLANTS.—Having a prospect of raising a crop of eggs the ensuing season from the egg plant, and not being acquainted with either the mode of culture, or cooking of this vegetable, I wish to inquire the proper mode of cultivating, and the best manner of serving its fruit for the table?—MISS LIZZIE, Greensboro, Ind.

The culture of the *Egg Plant* is not difficult. The plants may be raised in a hot-bed and transplanted into the open ground the middle of May, or they may be grown on a warm border, when they will be ready to transplant early in June. Plant out during showery weather, two feet apart each way, in a good, rich soil. Keep the ground free from weeds and mellow, by a diligent use of the hoe, and as growth advances draw earth to the stems. A few may be left in the seed-bed, where they will grow and do well. They are fit to be eaten when of about the size of a goose egg, and until nearly ripe. The usual way of cooking is to cut into thin slices, and fry them, when they taste something like fried oysters. We believe they are also used in soups and stews, though we have never tasted them prepared in this way.

RAISING GRAPES FROM SEED.—I have just commenced the culture of grapes, on a small scale, and of course take great interest in all you say about them, and particularly new varieties. You are my oracle on this subject. But my mind has been puzzled not a little by a remark in your notice of the *Blackwood Golden Hamburg*, in which you say "it was raised from the *Black Hamburg*, impregnated with the pollen of the *White Sweet Water*." Please gratify all your subscribers in this locality, and me in particular, by a more minute description of the process by which this new variety was propagated. I can imagine how a new or mongrel fruit could be raised from two different varieties by pollen impregnation; but cannot imagine how a new vine bearing the same kind of fruit could be more readily raised from such fruit seed than from the seed of any other, unless all the information has been erroneous on this subject, for our nurserymen are unanimous in the saying that grapes, like apples, grow very uncertain from the seed.—S. A. D., Kokuk, Iowa, 1859.

If we understand our correspondent, the difficulty in his mind is that the seedling should partake of the character of the parents, when it is known that "grapes, like apples, grow very uncertain from the seed." This is true, and so it is of strawberries and other fruits, and yet we often trace in a new variety a strong resemblance to the parents, to one, perhaps in foliage and habit of growth, and to the other in fruit. The plants raised from the same seed will also differ much in character, some resembling one parent, some another, some, perhaps, very little of either. We will give a chapter on Hybridization before long.

EXHIBITION OF FRUITS AND FLOWERS IN ROCHESTER.—THE SPRING MEETING of the *Fruit Growers' Society of Western New York*, will be held at the Court House, in Rochester, on Thursday, June 23, 1859, at 10 o'clock A. M. Important questions pertaining to the interests of Fruit Cultivators, will be discussed, and any member wishing any particular subject brought up, will please send early word to the Secretary, C. P. ENSLEY, Rochester. An Exhibition of Strawberries, Cherries, and other seasonable fruits will be made.

THE JUNE EXHIBITION of the *Genesee Valley Horticultural Society* will be held at Corinthian Hall on the same day, (June 23d.) At this show there will be a fine exhibition of *Roses*, *Peonies*, *Strawberries*, *Cherries*, &c. Indeed, we believe it is the intention to unite the two Exhibitions, making only one, and that at Corinthian Hall, the discussions, only, being had at the Court House. This is an opportunity to examine fruits and flowers that occurs only once in a year, and should not be neglected. A new feature has been introduced the present season. Hitherto the *lecturing* has been confined to the Judges; arrangements are now being made to furnish every visitor with a dish of strawberries, of any variety preferred.

MELONS.—In the *RURAL* of May 14th, you have made some very unfavorable remarks upon my melon article. The substance of your remarks is,—"Half an inch is not sufficient covering for such a bed of fresh, hot, horse manure." Why it should not be enough is of course a mystery to me, and the only way that I can take it is, that things that will answer here, will not answer in your part of the country, for I have always treated my melons in the way described, and always have raised good ones, and the plants look thrifty all summer, however hot the weather may be. The bed of fresh, hot, horse manure loses its heat, and becomes cool and damp, and remains so through the season. But, before I close I will say, that if the quantity of horse manure is as small as I described, it will not heat in the least all summer.—DAVID W. HENMAN, Fairville, Wayne Co., N. Y., 1849.

CAKES, GINGER SNAPS, COOKIES, &c.

EDS. *RURAL*.—Notwithstanding this is my first effort to aid in contributing a few good recipes for the benefit of those who are lovers of "good things," I do not intend it shall be the last. The following recipe I know from trial to be palatable, if nothing more:

GINGER SNAPS.—One and one-half cups of molasses; $\frac{1}{2}$ cup of sugar; 1 of butter; 2 tablespoons of ginger; 1 teaspoonful of soda dissolved in a cup warm water.

GINGER COOKIES.—Two cups of molasses; 1 of butter; 1 tablespoon ginger; $\frac{1}{2}$ teaspoon saleratus dissolved in a cup water; 2 of alum dissolved in $\frac{1}{2}$ cup water.

DOUGHNUTS.—Two cups sugar; 1 egg; 1 teaspoon saleratus; 1 do. salt; 1 nutmeg; $\frac{1}{2}$ pint cream; $\frac{1}{2}$ pint buttermilk—out in rings and fry.

QUEEN'S CAKE.—Two cups of sugar; 1 of butter; 1 of buttermilk; 4 of flour; 4 eggs; 1 teaspoon saleratus; 1 nutmeg; 1 pound raisins.

SODA CAKE.—Two cups loaf sugar; $\frac{1}{2}$ do. of butter; 1 of sweet milk; 1 spoonful cream tartar; $\frac{1}{2}$ spoons soda; the whites of 5 eggs beat to a stiff froth.

SNOW-BALL CAKES.—One cup of sugar; 1 of butter; $\frac{1}{2}$ cup buttermilk; 1 teaspoon soda; the whites of 8 eggs beat to a froth—bake in small tins. AUNT ISAAC.

CHICKEN PIE AND INDIAN PUDDING.

Take two full-grown chickens, (or more if they are small,) disjoint them and cut the back bone, &c., as small as convenient. Boil them with a few slices of salt pork in water enough to cover them, let them boil quite tender, then take out the breast bone. After they boil and the scum is taken off, put in a little onion, cut very fine, not enough to taste distinctly, but just enough to flavor a little; rub some parsley very fine when dry, or cut fine when green, this gives a pleasant flavor; season well with pepper and salt, and a few ounces of good fresh butter. When all is cooked well, have liquid enough to cover the chicken, then beat up two eggs and stir in, also some good sweet cream. Line a fire quart pan with a crust made like soda biscuit, only more shortening, put in the chicken and liquid, then cover with a crust the same as the lining. Bake till the crust is done and you will have a good chicken pie.

INDIAN PUDDING.—Boil a quart of water, put in a little salt, stir in corn meal while boiling till quite stiff. Take it off the fire and stir in cold new milk till thick enough to level itself. Beat up three eggs and stir them in the batter. Butter a pudding dish, put in the mixture, and let it bake an hour and a half. Serve with good, rich sweet cream and sugar. A FARMER'S WIFE.

BEEF PIES AND CRULLERS.

Messrs. Eds.:—As it is the duty and privilege of farmers' wives and daughters to contribute something in the shape of good recipes for the domestic corner of "our *RURAL*," I will offer one or two which I think good.

BEEF PIE.—Take nice white potatoes, pare and slice thin, boil in just water enough to cover them. When done have ready the paste, put in a deep dish, place layers of potatoes and beef, (which must also be cut in small, thin slices,) alternately until the dish is full, then cover with a nice crust, and bake thirty-five minutes. To be served warm. Call in your papa, husband, or lover, as the case may be, and try it.

CRULLERS.—Here is a recipe for crullers which I consider superior to any others I have tried. Take seven spoonfuls of coffee sugar and seven eggs, well beaten, or a spoonful of sugar to each egg, more or less, add a little salt, and season to your taste. Fry in nice white lard until a light brown. A quarter of a dried apple put in the fat while frying, will prevent them getting too brown. Pavilion, N. Y., 1859. Miss A. M. BISHOP.

CRACKER PIE.—Correction.—In the *RURAL* of May 28th I noticed a recipe for cracker pie. The recipe is a good one, with the exception that the chief ingredient is omitted. One cup of sugar should be added. I take the liberty to mention this to save pies from being spoiled, and the recipe being condemned, which is a good one in a scarcity of fruit.—AUNT CHARITY, La Roy, N. Y., 1859.

INQUIRIES.—Will some of the lady readers of this department give some good recipes for making Crackers? Also tell us something of Cooking Meats, as a knowledge of this is essential to every housekeeper. Those who can compound such cake and pie as our *RURAL* housekeepers, can certainly prepare meats for an epicure, however dainty.—A., Empire State, 1859.

JOHNNY CAKE.—One pint sweet milk; 1 teaspoon soda in the milk; 3 tablespoons sugar; 3 do. flour; 1 do. butter; 1 teaspoon salt; 2 eggs; 2 teaspoons cream tartar in the flour. Indian meal to make it about as thick as pound cake.—EDWARDS, Skaneateles, N. Y., May, 1859.

PICKLED EGGS.—At the season of the year when eggs are plentiful, boil some four or five dozen in a capacious saucepan until they become quite hard. Then, after carefully removing the shells, lay them in large-mouthed jars, and pour over them scalding vinegar, well seasoned with unground pepper, allspice, a few races of ginger, and a few cloves of garlic. When cold, bung down closely, and in a month they are fit for use. When eggs are plentiful, the above pickle is by no means expensive.—Selected.

REMEMBER ME.

BY GERTRUDE GEE.

O, not in youth's bright spring-time
When skies are brightest o'er me,
When with flowers fair and sweet
My path is strewn before me;
Not when upon my cheek
The glow of health you see,
When life and joy are in my eye—
Not then remember me.

And not when bright wing'd Hope
Sheds her mystic radiance round me,
When in life's garish noonday
Summer friends surround me;
Not then when Fortune smiles,
When my heart is light and free,
When earth is but a fairy land—
Not then remember me.

But, O, when friends forsake me,
When all is lone and dark,
When wintry storms o'ertake me,
Tossing my foundering bark;
And when my cheek is fading—
When Hope's bright day-dreams flee,
When sorrow my brow is shading,
Then—then remember me.

Cleveland, N. Y., 1859.

Written for Moore's Rural New-Yorker.
QUEEN MARY'S LOVE.

BY MRS. ALLEN MORRIS.

O! DARK is the gloom o'er my young spirit stealing!
Then why should I linger where others are gay!
The smile that I wear, is but worn for concealing
A heart that is wasting in sadness away.

(Mrs. WELBY.)

At sixteen, MARY, the eldest daughter of JAMES the Second, was married to WILLIAM of Orange, who was then twenty-eight. She was pretty, graceful, loving, and of common understanding; but she lacked that strength of intellect which would have been worthy the counselor of the greatest Prince of his times, yet what she lacked in mental capacity was much more than ordinarily supplied by the constancy and depth of affection with which she regarded her cold and reserved husband. Had she been a woman of ambition and great mind, she would have reigned alone upon the throne of her ancestors, but untold love and adoration for WILLIAM filled the soul of the noblest and purest of Princesses.

They had been married about nine years, and though the faithful wife had tried every means in her power to make her husband happy, she could not help perceiving that something weighed heavily upon his mind,—that he was far from being happy,—and a few words from MARY's instructor in divine matters, revealed to her the cause of WILLIAM's strange reserve.

At the death of King JAMES, MARY would then be the ruling sovereign of a great Kingdom,—a person of no small consequence,—while her husband would occupy only a subordinate position. This thought continually galled the proud spirit of the ambitious Prince, while MARY, in the simplicity of her heart, never cared or dreamed that she should ever be more than the wife of her husband.

WILLIAM was a man of good morals, of trusting friendship, of clear judgment, great strength of intellect, and indomitable will—yet with a soul of the deepest feelings, the keenest sensibilities, under the most implacable reserve, and most perfect self-control. He was worthy the love of a noble woman, like MARY of the STUARTS, and of the love and homage of his own subjects, and better qualified than any living Prince to succeed to the British throne. He did not wish to rob his wife of her own rights, but he could not rank below her, and he little understood her heart and her devotion.

One day in summer time, when nature was inviting, the Prince, who brooded over his griefs but never spoke of them, started out on the chase, of which he was exceedingly fond. His figure was slender, for his health had always been delicate. His eyes were bright and piercing, his cheeks thin and furrowed with lines of care, his forehead high and broad. He was a great warrior rather than a statesman—he rivaled in the battle field even the old and renowned Generals of his times. While he was pursuing the game through his native forests the Princess retired to her private apartments. She looked about upon the rich and costly adornings of her palace chamber, but not all the grandeur, the wealth, the homage paid to a Princess, could fill her heart with gladness and her life with happiness—she mourned over unreturned love. She sat down upon a low cushion and buried her face in her hands and wept. Slowly the tears rolled down her beautiful face, and her bosom heaved with heavy bursting sobs. "Why, oh, why, my God, can I not inspire the love of the Prince—there is nothing in the world I would not do for him—my life, even; would I give for his happiness," were the thoughts of her yearning, loving nature.

There was an altar erected in her apartment for her private devotions. She knelt there long, long, for the burden of her soul was great—too great it seemed for mortal to bear. Her jeweled hands were clasped, and her beautiful eyes raised toward heaven—she needed no form of prayer then, her own lips alone could frame the prayer of her soul—she was very devotional, and possessed great faith in God. She left the room, and was soon after sought by BARNET, her spiritual instructor, who had long known the cause of the estrangement between the Prince and Princess. He plainly told her what were the feelings of WILLIAM—the cause of his unhappiness—and she learned for the first time that when she became Queen of England WILLIAM would not also be King.

"Oh," she said, "there was no proof of love and submission that she was not ready to give."

"The crown is yours in legal right—it is your own, your just inheritance, my esteemed Princess, and you can easily, when you ascend the ancient throne of your fathers, induce your Parliament to give your husband not only the regal title, but the administration of affairs; but your Royal Highness should consider well before announcing such a resolution, for having once made it, you cannot safely or easily retract."

"My best of counselors,—I want no time, it is enough that I have an opportunity for showing my regard for the Prince. Tell him what I say, oh, tell him now, and bring him to me, that he may hear it from my own lips."

BARNET went in search of the Prince, but he had not yet returned from the chase—was many miles away. It was late when he returned, and MARY did not see him until next morning. She passed the night anxiously counting the slow hours, for she wished to make her husband happy. At the invitation of MARY, WILLIAM sought her in her apartments. She arose, and with a beautiful smile of love and devotion, begged him to be seated—she knelt at his feet, taking his hand, and looking tenderly in his large beaming eyes.

"My husband, I did not know until yesterday that there was such a difference between the laws of England and the laws of God. But I now promise you that you shall always bear rule, and in return I ask only this, a large place in the heart of WILLIAM of Orange for his wife—a husband's love is all I ask—and I shall observe the precept which enjoins wives to obey their husbands, and you will observe that which enjoins husbands to love their wives."

This generous affection could not but gain the love of so worthy a man as WILLIAM. From that time the confidence of the happy pair was entire, complete, and at the sad day of MARY's death he was carried from her room in convulsions. She was loved by him as woman is seldom loved—for where in the annals of history is an example so full of self-sacrifice—of entire devotion. Their names are associated together in history—it was the reign of "WILLIAM and MARY." There have been other Queens who have achieved triumphs by the greatness of their minds, the brilliancy of their reigns—such as ELIZABETH of England, and CATHERINE of Russia—but the true and noble heart of the woman we love and ever admire, is MARY the Princess of Orange.

FEMALE EDUCATION.

Let the education of the young woman be commensurate with her influence. Is it true that, in the completion of social life, she is the mistress of that which decides its hues? Then let her be trained to wield this fearful power with skill, with principle, and for the salvation of social man. Does she sometimes bear the sceptre of a nation's well-being in her hand? Cato said of his countrymen, "The Romans govern the world, but it is the women that govern the Romans."

The discovery of this very continent testifies to the political influence of women. Who favored the bold genius of Columbus? Do you say Ferdinand of Spain? I answer Isabella, prompting her partner to the patronage he so reluctantly bestowed. Her influence unexercised, the Genoese mariner had never worn the laurel that now graces his brow. Will you now leave this all-potent being illiterate, to rear sons debased by ignorance, and become dupes of the demagogue?

Look at the domestic circle! Not more surely does the empress of night illuminate and beautify the whole canopy of heaven, than does woman, if educated aright, irradiate, and give her fairest tints to her own fireside. To leave her uncultivated, a victim of ignorance, prejudice, and the vices they entail, is to take home to our bosoms a brood that will inflict pangs sharper than death. For the love and honor of our homes, let us encourage the most liberal culture of the female mind.—*Young Maiden.*

ROMANCE OF THE NEEDLE.—What a wonderful thing is this matter of sewing! It began in Paradise, and was the earliest fruit of the fall. Amidst the odor of flowers, and by the side of meandering streams, and under the shade of the dark-green foliage, the cowering forms of the guilty progenitors of our race bowed in anguish and shame, as they took their first lessons in that art which has ever since been the mark of servitude and sorrow. And yet the curse has not been without its blessing. The needle with the thimble has done more for man than the needle of the compass. The needle-work of the Tabernacle is the most ancient record of the art. Early used to adorn the vestments of the priests, it was honored by God himself, and became a type of beauty and holiness. "The king's daughter is all glorious within; her clothing is of wrought gold; she shall be brought unto the king in raiment of needle-work." The magnificence of kingly pomp, the imposing spectacles of religion or wealth, the tribute of honor to the great, the charm of dignified society, the refined attractions of beauty, are dependent upon the needle.—*Christian Intelligencer.*

SISTERS AND MOTHERS.—These are ties which like the invisible strings of conscience, bind man to the world of kindly affections, and are the last things forgotten when one leaves life. The marriage situation may be one of pure and uninterrupted felicity; there may be no cloud in its whole happy horizon; it may be ever sunny, and flowers spring in it at every season of the age; but even these happy ones, who are in this climate of bliss, remember long and late the claims of a sister or a mother to their best affections. The feelings inspired by both sister and mother are all derived from sources pure as the Divinity that inspired them.

ENVY, like a cold poison, benumbs and stupefies; and thus, as if conscious of its own impotence, it folds its arms in despair, and sits cowering in a corner. When it conquers it is commonly in the dark, by treachery and undermining, by calumny and detraction. Envy is no less foolish than detestable; it is a vice which they say keeps no holiday, but is always in the wheel, and working upon its own disquiet.—*Jeremy Collier.*

Written for Moore's Rural New-Yorker.
SUMMER.—A SONG.

How often, loved Summer, when cold Winter, dreary,
Held all these thy beauties in his chill embrace,
Have I longed wished, until patience grew weary,
For thou, Queen of Seasons, to reign in his place.
Now fair, blooming Summer, I hail thee with pleasure,
Thy soft genial breezes—thy sweet breathing flowers,
Thy verdant fields waving—thy promising treasure,
Thy forests delightful and ambrosial bowers.

The jet-plumaged warblers a welcome are singing
To thee, thou blest harbinger, Summer, with me,
As o'er the green meadows they gaily go winging,
All buoyant and happy, all gullible and free.
Through all the wide woodlands rise anthems unnumbered

To Him who hath sent thee o'er nature to reign—
Dull man, O, awaken! too long hast thou slumbered,
Lend thy feeble efforts to lengthen the strain!
Friendship, N. Y., 1859. GERALDINE.

Written for Moore's Rural New-Yorker.
THEORY vs. PRACTICE—HEART vs. TONGUE.

MAN's life is full of strange contrasts and queer contradictions. From the cradle to the grave he is continually playing a double part. The language of his heart, and the acts of his life are often at total variance. He can talk and theorize most admirably on all matters of public or private policy; but heart and practice ever stand out in bold relief and opposition thereto. We see the working of this everywhere—all around us, at all times and places. For instance, see that group of school-boys. They are engaged in the noble, health-invigorating game of ball. They are all attention, and enjoying it finely, when lo! the school-bell rings. Everything is dropped instantly,—it is "bide for school," &c., and a casual observer might imagine, from the alacrity of their obedience to the summons, that of all possible spots, the dear old school-room was just at that very moment the most attractive and inviting. Not so—if the truth was only known, they wish heartily for another half hour's enjoyment of their favorite sport.

See that unsophisticated youth who is about leaving home for the first time to shift for himself, or, in other words, to "paddle his own canoe" upon the great sea of life. With what tender solicitude does the anxious mother caution her darling boy against evil associations, and the many temptations incident to youth, enjoining him to remember the precepts he has been taught from his infancy, and exhorting him, by the cultivation of habits of industry, strict integrity, and usefulness, to reflect credit upon himself, his parents, and his friends. Now we do not pretend to say that that mother really felt in her heart that the noble boy would fail; no, she knew better all the while! To all these cautions, injunctions, and exhortations he dutifully assents, and readily promises implicit obedience,—but his heart replies, "Does my mother suppose that I do not know enough to take care of myself?"

Look at the scheming politician and statesman. Hear him lay down his brilliant theories for the furtherance of the wealth, prosperity and happiness of his dear country! Doesn't he expatiate, and promise—and isn't he all *suavity* immediately before election! but how does his *practice* agree with his fair professions? Truly, he is very forgetful, very inconsistent—rather reminds one of a guide-board, which will point the way, but will not walk therein.

Take the disinterested parson—loud in declaiming against the greed of gain, love of mammon, sin of covetousness, etc., exhorting his flock by all means,

"To hate the world—in holy ways be bold;
And shun the soul's seducer—glittering gold!"
See him yield a ready compliance to a loud call elsewhere—as the poet pertinently observes:

"What though the stipend was a trifle more
To one who placed in wealth so little store
This had no weight, you know, at all;
'Twas not the cash; Oh, no, but 'twas the Lord commanded!"

And, though 'twas hard to go away,
Should he refuse the Lord's obey,
And be a careless servant branded?
No, sure, so he must go."

"Pray keep your sitting—make yourself perfectly easy," says the impatient editor to his tedious visitor, who has already detained him until the "boys" are frantic for "more copy"—casting a distracted glance at his unfinished "leader,"—while in his inmost soul he has long been wishing him well clear of his sanctum!

"Why, how do you do, my dear Mrs. C.," exclaims the fashionable Mrs. B., as she languidly sails into her splendid parlor, (just from the perusal of the last novel,) to receive her visitor. "How rejoiced I am to see you! and how are your little children? Let the little dears make themselves perfectly at home." After a lapse of fully ten minutes, during which time "little dears" had found ample employment for their mischievous fingers, to the no small detriment of table-ornaments, and window drapery, the lady is most obsequiously bowed out, with a pressing invitation to call again soon, with her interesting children.—Simultaneous with the closing of the door, the language of the heart is heard, in the soliloquy which follows very much after this sort:—"Oh! dear, was there ever such a bore?—did I ever see such ill-behaved children! They have ruined everything they have laid their dirty fingers on. I hope Mrs. C. will keep her ugly brats at home in future!"

Behold the lawyer shedding great tears, as he piles on the pathos, (after he has sufficiently belabored the intelligent and discriminating jury,) for his client, the great rascal whom he knows is guilty, who sits there in all the meekness of injured innocence, where the convincing arguments

and touching appeals of his learned counsel have so adroitly placed him.

Who has not heard the pretty maiden declare, time after time, her firm resolve never to marry? Does she *practice* what she preaches? Does she mean what she says? On the contrary, while in the very act of giving utterance to her scornful disclaimer of anything like affection or regard for the man, her thumping heart declares—"Fie, SATUR, that's a bouncing lie!"

And so it is, go where you may—this popular antagonism of *practice to theory*—*heart to tongue* is ever seen. We might extend these examples, but trust our meaning is sufficiently apparent. A thought suggests itself, however,—is this inconsistent being we have been considering, man?—man, created in the image of his Maker, endowed with talents of a high order, and placed at the head of all created beings? If it is man, has he not sadly degenerated from what he should, and was intended to be? Is this false appearance and double-dealing necessary? We answer, emphatically, *No*. And far nobler would man appear if his *tongue* ever gave utterance to the sentiments of his *heart*. We should then see him honest with himself, honest with his fellow, honest with his Maker, and Pops says,

"An honest man's the noblest work of God!"

DAY DREAMS.

It is a very easy matter to sit with folded hands and be a hero. Imagination never tires; our feet never falter from fatigue; we have no need to wipe the sweat drops from our aching brows; no need to turn aside from loathsome sights and unpleasant sounds; to hear the gibes and sneers of those who walk not as we walk; but living ever in an ideal world, among flowers and singing birds, dream away the life God gave for active deeds of benevolence, and loving kindness to our fellow creatures. No wonder that so many of us wander unsatisfied; our aspirations unrealized. We have no right to expect to enjoy what we have never earned. Have our dreams ever placed upon our heads a brighter crown than decks the brow of FLORENCE NIGHTINGALE? and yet, we can but partially see how it was won. Our Father only knew the heart aches; the fearful struggles, ere the world, its pleasures, and its friendships could be resigned for a work so merciful, that angels must have hovered very close around her pathway, ready to minister unto her, when poor human nature felt the strain too keenly. And you, my sisters, (I speak to the pure, the good, and the true,) would gladly exchange your dream wreath, for the bay that so beautifully crowns our own ELIZABETH BLACKWELL; and yet it was not easily obtained. Alone, and unassisted, she walked bravely on; her own sex, those for whom she was toiling so patiently, looked at her askance, turning aside, lest contact with one so daring, might leave a stain upon their own garments. They could not comprehend the high and holy spirit which incited her mission, their own hearts had never been stirred by that deep love for humanity which impelled that noble woman on, until prejudice was disarmed; and the prize she sought was won. This was not the diploma she received in common with her brothers; but a more satisfying result to a mind like hers. She has opened a path in which her sisters can now safely tread; and thousands of earth's suffering daughters, are blessing her, who dared to be true to her own lofty nature, regardless of the world's smiles or frowns.

Dreams can never satisfy us, but leave the mind enervated and incapacitated for any real good; one effort of the will, one act of self-denial will do more for us than a life-time of wishing; and though we may not become what some others have, we may still be workers in our Master's vineyard, and if we hear at life's close the words, "she hath done what she could," they will sound no less sweetly to our ears, than if earth's loudest praises had greeted them here.

Covington, May 17, 1859.

USE OF ADVERSITY.—You wear out your own clothes. You are not troubled with many visitors. You are exonerated from making calls. Boreds do not bore you. Sponges do not haunt your table. Tax-gatherers hurry past your door. Itinerant bands do not play opposite your window. You avoid the nuisance of serving on juries. You are not persecuted to stand god-father. No one thinks of presenting you with a testimonial. No tradesman irritates you by asking, "Is there any other little article to-day, sir?" You practice temperance. You swallow infinitely less poison than others. Flatterers do not shoot their rubbish into your ears. You are saved many a debt, many a deception, many a headache. And lastly, if you have a true friend in the world, you are sure in a very short space of time to learn it.—*Selected.*

SATURDAY NIGHT.

THE week is past; its latest ray
Is vanished with the closing day;
And 'tis as far beyond our grasp
Its now departed hours to clasp,
As to recall the moment bright
When first creation sprang to light.
The week is past! If it has brought
Some beams of sweet and soothing thought,
If it has left some memory dear
Of heavenly raptures tasted here,
It has not winged its flight in vain,
Although it ne'er return again.—*Boring.*

THE PRESS.—Much has been accomplished; more than people are aware—so gradual has been the advance. How noiseless is the growth of corn!—Watch it night and day for a week, and you will never see it growing; but return after two months and you will find it all whitening for the harvest. Such, and so imperceptible in the stages of their motion, are the victories of the press.—*De Quincey.*

COLUMBUS, speaking of the zest for new truth felt by those already well instructed, as compared with the indifferent mental appetite of the ignorant, says:—"The water-lily, in the midst of the water, opens its leaves and expands its petals to the first pattering of the shower, and rejoices in the rain-drops with a quicker sympathy than does the parched shrub in the desert."

AFTER THE NIGHT, MORNING.

When the day is clouded,
Dreary, dim and cold;
In its web of shadows
Not one hope of gold—
Wing with hope the hours,
Till the morrow's hand
Flings a veil of amber
O'er the smiling land;
Just outside the cloudy gate
All the golden sunbeams wait!

When the heart is sombre,
Shrinking like a tomb
Joys that droop to ashes
From their richest bloom—
Though life's rare enchantments
Die with their decay—
Wait till some white angel
Roll the stone away;
From its grave some bliss may rise,
Purer than the joy that dies!

When dear hopes have vanished,
As the bright stars flee
From the wrathful midnight,
Wait thou trustfully—
Buds that die in autumn,
Sunny June will bring;
And some hopes must perish
That new joys may spring!
Every cheerless winter day
Leads at length to bloom and May.

THE IDEAL.

There are so many rough places in our pathway that the frequently repeated maxim, "Life is real, life is earnest," grates very harshly on our ears. We long to leave the dull routine of practical life, leave behind the world as it is, and take a ramble with fancy, to look at things as they *might be*, or build for ourselves airy castles, decorated with beautiful pictures, and place therein an image which is the embodiment of all that is *pure and beautiful*. When our hearts sicken at the sight of sorrow, crime, and error, then this image casts its shadow over the objects about us, removing much of the gloom of stern reality. And we ever endeavor, though vainly to make ourselves like unto this image, and though this temple and these shrines have been broken down; though we have wept to see them crumble, yet they have been rebuilt, and we have had purer, nobler purposes, higher aspirations, and warmer desires to elevate ourselves and the world.

The world has its dreamers and its actors; the practical portion of mankind keep life's machinery in motion, while others, finding no attraction or congeniality in life as it is, dream their lives away, crowning and re-crowning some ideal goddess.—Nor do they dream in vain—they dream noble dreams; think noble thoughts; originate grand schemes which they leave for their more practical neighbors to carry out—thus the dreamer and the actor each has his work to do, but there is not that harmony of character that there is when the several parts are so fitted together as to make one perfect, complete whole, when the ideal and real are blended.

Practical people denounce the ideal as a fair mockery, treacherous as beautiful, they look upon the creation of fancy as a waste of time, and a dissipation to the mind, rather than as a gentle force to add strength to the mental powers; as life is this to be wondered at, for once these cold, stern, practical mortals, yes, even they once had an ideal shrine at which they sacrificed their hearts' best, warmest impulses; but they have seen them polluted, and now they are broken down. Perhaps the vivacity of youth has passed away, and they look back upon their early fancies as an idle dream. But there are some young persons who seem to have no particular object in life, no ideal standard, to which they strive to attain, no fancy imagery to make their youthful lives more beautiful. It always makes one sad to see them, for when they reach maturer years they will be still more cold, and chill other youthful hearts. On the other hand imaginative persons are no less severe in their denunciation of the practical; they have such a disgust and disrelish of the busy life about them that were they the representatives of mankind in general, the machinery of every-day life would very soon stand still.

We read in that Great Universal History, of a city with golden paved streets, the Great White Throne, and the most glorious of all of Him who sits thereon. Here are blended the ideal in character with the real in existence.

Let the worshiper at fancy's shrine, still worship there, and, with a soul ennobled by beholding the grand first image of ideal, be ready to perform life's great practical mission, and let him whose mind never rises above dull, prosy care, cast a glance upward to Him who sits on that Great White Throne, and may the image of the Greatest and Best be stamped indelibly upon all souls.

MATTIE M. MINER.

"LEADING MEN."—It is customary to speak of sundry men in the Church of Christ, as "leading men;" i. e., they go before others, and make and second the motions which others vote for. It should not be forgotten, however, that a man in a Christian Church, who really deserves the name of a "leading man," serves the Church. He moves and goes in the right direction. As DAXTER well remarks,—"Church greatness consists in being greatly serviceable."

HERE AND HEREAFTER.—It is strange that the experience of so many ages should not make us judge more solidly of the present and of the future, so as to take proper measures in the one for the other. We dote upon this world as if it were never to have an end, and we neglect the next as if it were never to have a beginning.—*Fenelon.*

TEACHING.

DEAR READER, did you ever teach school? If not, let me tell you (unless you are an Editor,) that you know little about trouble, and still less about human nature. Just imagine yourself surrounded by a crowd of "young ideas" four years old and upwards, which you are expected to initiate, advance, and graduate in the art of "shoot"-ing, and then determine how many various compounds, permutations, combinations, and arrangements, may result from the heterogeneous mass, and you will have in advance, some idea of experience which awaits you. If you do not, before the close of the first session, gather material for a volume of sermons, a treatise on family government, a quarto of adventures, (i. e., if you board around,) a book of poetry and a comic almanac the fault will be your own. You will be pretty sure, also, to acquire a good portion of orthodoxy in the line of doctrine. I never knew a teacher who was not a firm believer in "total depravity," and but few who did not consider Solomon unquestionable authority on the use of the rod.

Theoretically, the teacher's is a high and holy calling—practically, it is an awfully responsible one, burdened with the interests of eternity; yet, after all, when we come down to the every-day minutiae, there is so much of nature in its primitive simplicity, so much to excite the risibilities, that I sometimes wonder whether comic almanac-makers are not retired school-teachers. From the youngster in pinafores to the young lady past her teens (I beg her pardon) it is comical all the way up.—The little fellow who reads "p-o-t, kettle," has just as clear an idea of what he is doing as the young lady who tells you, on the authority (I) of the master of criticism that "the natural signs of passion are voluntary," and both compare favorably with a third, whom I once heard render a passage from Byron's "Darkness," in this wise:

"The palaces of crowned kings, the hails,
The habitations of all things which dwell—
Were burnt for fuel on."

It was enough to upset the gravity of a Puritan, and yet where is the school-room in which such blunders never occur?

As for patience, Jon himself would have needed a fresh supply, had he turned teacher. In the school-room, as elsewhere, it is not the dashing of the great wave, but the continual dropping which wears the stone. Great troubles do not often occur; it is the little trials, the petty cares, the constant watchfulness that try one's temper. It requires all one's self-control not to give way, sometimes, to impatience, yet to him who does give way—his empire is at an end.

The teacher must not expect too much. Perseverance will accomplish wonders, but it will not always bring success, and he must be prepared for an occasional failure. There are some scholars that *won't* learn. They are too lazy to study, too stupid to think, too easy to be ambitious, and if, perchance, they are forced out of the common branches into any of the higher studies, their ignorance cannot be concealed. They never know *d* from *d*. Like the *Shibboleth* of the Ephraimites, these letters are sure to betray them.

Notwithstanding these petty trials, the teacher receives, in the success of those who will learn, an ample reward for his labor and his care. They whose character he has formed, whose intellectual symmetry he has fashioned, will remember him with grateful affection, and future generations "shall rise up to call him blessed."

Standardsville, Va., 1859. BERTHA MORTIMER.

THE TEACHER IN THE SCHOOL-ROOM.

If we enter successively a number of school-rooms, we shall probably discover a contrast something like this:—In one we shall see a presiding presence, which it will puzzle us at first sight to analyze or to explain. Looking at the master's movements—I use the masculine term only for convenience—the first quality that strikes us is the absence of all effort. Everything seems to be done with an ease which gives an impression of spontaneous and natural energy; for, after all, it is energy. The repose is totally unlike indolence. The ease of manner has no shuffling and no lounging in it. There is all the vitality and vigor of inward determination. The dignity is at the farthest possible remove from indifference or carelessness. It is told of Hercules, god of real force, that "whether he stood, or walked, or sat, or whatever thing he did, he conquered." This teacher accomplishes his ends with singular precision. He speaks less than is common, and with less pretension when he does speak, yet his idea is conveyed and caught, and his will is promptly done. When he addresses an individual or a class, attention comes, and not as if it was extorted by fear, nor even paid by conscience as a duty, but cordially. Nobody seems to be looking particularly, yet he is felt to be there, through the whole place. He does not seem to be attempting anything elaborately with anybody, yet the business is done, and done remarkably well. The three-fold office of school-keeping, even according to the popular standard, is achieved without friction and without failure. Authority is secured, intellectual activity is stimulated, knowledge is got with a hearty zeal.

Over against this style of teacher we find another. He is the incarnation of painful and laborious striving. He is a conscious perturbation, a perpetually excited paroxysm; an embodied flutter; a mortal stir, an honest human hurly-burly. In his present intention he is just as sincere as the other. Indeed, he tries so hard, that by one of the common perversions of human nature, his pupils appear to have made up their minds to see to it that he shall try harder yet, and not succeed after all. So he talks much, and the multiplication of words only hinders the multiplication of integers and fractions, confuses the government and beclouds the recitation. His expostulations roll over the boys' consciences like obliquely shot bullets over the ice, and his gestures illustrate nothing but personal impatience and despair. — *American Journal of Education*.

In an easy flowing style.

The sun that throws his halo o'er This Eden of the brave; The wild waves of the ocean's shore, The rock-bound coast they lave;

6/8

But ocean, like a yawning grave, Seems eager for its prey; The famed of earth, the good, the brave, Bloom but to pass a - way.

6/8

Earth hath no joy unmixed with pain; Pure friendship is unknown; There's dis - cord in its purest strain: Peace blooms in heaven lone

Poetry by Miss Hazard.

The Reviewer.

THE LIFE OF GENERAL H. HAYLECK, K. C. B. By J. T. HEADLEY, author of "Napoleon and His Marshals," "Washington and His Generals," "Sacred Mountains," etc. Illustrated. New York: Charles Scribner.

By the agency of a neat volume containing nearly four hundred pages, we are placed in possession of a full and extended biography of the eminent Christian soldier, HENRY HAYLECK. The author, in his endeavor to account for the peculiarity of the fact that the biography of so distinguished a British general should be first attempted by an American, remarks "that HAYLECK was one of those rare characters that belong to the race, and are not the exclusive property of any nation. The mere fact that when the news of his death reached this country, the flags of the shipping in the port of New York were hung at half-mast—a mark of respect never before shown at the death of any chieftain or potentate of the Old World—shows how deeply the sympathies of the American people were enlisted in his career." Mr. HEADLEY undertook the present work only at the urgent request of a friend of HAYLECK's family, and of the missionaries with whom HAYLECK was on the most intimate terms, and on the assurance that those relatives of the deceased soldier who had contemplated issuing a memoir would be unable to accomplish the object for several years. Of Mr. HEADLEY's style it is unnecessary to speak, suffice it to say that every opportunity has been afforded him to procure the material for a work of vivid interest, and the manner in which he has improved these facilities, has in nowise tarnished his fame in the field of letters. For sale by ADAMS & DABNEY.

THE *North British Review* for May will have ardent friends when its merits are thrown forward in comparison with the other publications of the quarter. The review of the first volume of MASON'S *Milton and His Times*, gives us all that is known of the poet's life, when viewed in connection with the political, ecclesiastical, and literary history of his day. We are also furnished with a biographical sketch of the late Douglas Jerrold; Select Memoirs of Port Royal; Sketch of the History and Development of Socialism; Lectures on Metaphysics and Logic; Miss Proctor's Legends and Lyrics; The British Press; Public Life of Lord Brougham, and a well-written paper on Ornithology Anatomy. LEONARD SCOTT & Co., New York. Sold by DEWEY.

ANECDOTES OF WILD GESE.—NO. II.

My first story was rather lengthy, and I promise this time to be more brief. For years, and I may say always since I commenced to think for myself, have I been a lover of wild geese, and to tell the truth, I believe my interest was first enlisted upon hearing that "the cackling of geese once saved Imperial Rome." That it was the cackling of wild geese I do not say, but this little incident made such an impression upon my boyish fancy, that since then I have taken every possible occasion to inform myself and get posted up in this particular branch of natural history.

The first pair of wild geese I possessed, and which I valued as only an amateur knows how, met with an early and unfortunate death. They were very wild when I obtained them, and I took the utmost pains to make them acquainted with my presence and whistle, and imagine my pleasure when, after much trouble, I quieted their fears, so that they would feed out of my hand, and always approached me as if for protection, when any stranger or strange thing made its appearance. But after all this affection on their part I never dared to allow them to go past the seasons, (spring and fall,) without having their wings clipped, which, if suffered to grow out, they would take advantage of and fly away.

They were only a year old when I got them, and when the third year came about I was looking with intense interest and speculation upon the probability of their breeding—imagine my disappointment and vexation one fine spring morning, upon hearing the report of fire-arms at the pond, I hastened on with my clothes and quickly as possible got down there—only to find my poor pets unceremoniously being dragged by their necks out of the water by the vandal who had shot them. What I said it matters not, as I am a person of a very quiet temperament; but why, you ask, did he kill them on private grounds? I will tell you. He was a new-comer in our neighborhood; some kind of a mechanic in a large furniture establishment, who, returning home just at night, espied the geese in the pond, said to himself, "if you will only wait patiently until morning I will load my gun and kill you." Sure enough they were there in the morning and with a good round charge in his fowling piece, he fired away at them almost under his nose, and as the sequel is already told, killed them both. The fellow was just from California, or some place where wild geese frequented, and had been in the habit of shooting them; but after the mild address I gave him, I doubt not he was more careful where he sent his lead.

After this experience, nothing daunted, I procured another pair, who, in due course of time, commenced breeding—nor have I since been without their happy look. But to give an anecdote as the heading indicates. As the past fall approached, all of my geese showed more or less sign of uneasiness and disposition to take a journey south, which was prevented by their being pinioned.—One particular pair (and handsome birds they were,

too,) tormented me, by wandering to a small stream half a mile off, and sometimes I was obliged to follow it up a long distance before I could find them. Finally I concluded to shut them up. Before I imprisoned them I lost two of my geese by the rump and in a few days I heard the female shut up, making that peculiar noise which (swan like) had preceded the death of the others, and which I hoped might not prove fatal if good nursing could save her; but, alas! passing the coop late in the afternoon I heard a struggling and fluttering as though some animal had the geese by their necks and was choking them. Upon hastening to open the door and look at them I found the gander had the goose by the neck and was evidently trying to choke her to death, and she it was that made the noise of strangulation. Pulling her away from him, which made him perfectly furious, so that he attacked me, I found, upon examination, that she was badly bruised and very bloody. Putting her by herself I visited her on hour afterwards and found her dead, why and wherefore I could not explain, and must say I felt exceedingly puzzled.—Finally, one day I happened to meet a friend that had more experience than myself and I told him my story, asking him if he could account for the gander killing his mate. Oh yes, he said, nothing easier, I have had the same thing occur twice. In both instances the females were the parties attacked by the rump and their mates killed them in like manner as did yours, besides which I have heard of the same thing from other sources. The rump is a distressing sickness, and one from which they seldom recover, and the loving husband, rather than witness such cruel pain, kills her to put an end to her agony.

By-the-by, let me ask if you, or any readers of the *RURAL*, have ever seen or heard of a *white* wild goose? Two of my friends that have been in California insist upon it that they have seen with wild geese, *white* ones, and more than that, have killed them. I cannot understand how this can be, and think they must have been mistaken.

Dedham, Mass., 1859.

SOMETHING FOR GEOLOGISTS.

On the bank of Buffalo Run, a small creek near the southern boundary of Greene Co., Va., is one of the most remarkable curiosities which I have ever seen—a rock marked with human foot-prints. The surface of the rock, which is several feet square, slopes gradually towards the stream, and the tracks extend to the water's edge. In appearance the foot-prints are those of a child of three or four years. The first tracks are not deep; the next are irregular, as if the child had tottered and crossed its feet to preserve its balance. Below, the ball of the foot and toes have left a deeper impression, as if the little thing had attempted, by bracing its feet in the soft clay, to stop in its downward course. Then the tracks are a little lengthened at the heel, as if the foot had slipped—each one, as it proceeded farther, presenting a longer slide, until the doom of the little one was sealed by the last foot-step which slips off into the water.

There are many conjectures as to the origin of these tracks. Some maintain that they are the true impressions of a child's feet, made while the rock was in a clayey state, others suppose them to be the work of the Indians, carved there in commemoration of some unfortunate little one, that had walked down the rock into the water. There is material for a poem in either conjecture.

Standardsville, Va., May, 1859. BERTHA MORTIMER.

FEEDING CALVES.

Messrs. Eds.:—I will give you something I am sure will help some of your *Young Ruralists* in the vexing business of feeding calves. Where there are a number together, every boy who has tried to feed with pails knows what danger there is of losing milk, toes, and patience. Having a dozen to feed one year we made stanchions for them on the side of the lot facing the house.

We took a basswood stick about thirty feet long and faced it on one side. Then dug out troughs as large as wanted, 2½ feet apart. Then, by setting a post at each end and in the middle, we stretched strips two by six the whole length, the bottom one being on a level with the trough and the upper one two feet higher, nailed on the top of the posts. The strips should be bored previously for the stanchion rounds opposite each trough. By making one of the rounds fast and boarding up between, the thing was made.

After this it was mere fun to feed calves. We had just to pour into each trough the required mess, and by simply raising the loose round the fellows are let in and fastened in a moment. This was made on the farm of Hon. Geo. Geddes, in Fairmount, N. Y. It did well.

If you think the patent right worth a copy or so of the *RURAL*, we can use them among our neighbors who have none.

B. G. MASON.

Fowlerville, Livingston Co., Mich., 1859.

AN OUT-DOOR CELLAR.

Messrs. Eds.:—I noticed a letter from one of your correspondents requesting information how to build an out-door cellar where he could not dig. My father made one last fall and I will describe it for his benefit as well as for the rest of your readers. We first laid up the frame of logs and built a sloping wall around it, out about three feet at the bottom and sloping to within eighteen inches at the top. Filled in with dirt between the logs and the wall, filling the cracks with straw to keep the dirt from running in.

Then we laid a log across for the middle of the roof to rest on and laid sticks across it. Then put on two feet of straw and covered thick with dirt. With double doors this made us a good warm cellar.—E. W. MASON, Fowlerville, Livingston Co., Mich., May, 1859.

QUIET VS. FUSS.—It is amusing to notice how, in some parts of the world, noise and pretension pass for power and merit. In reading the life of WATT, the inventor, recently published, we find in his correspondence a paragraph which both illustrates this popular infirmity of judgment, and exhibits the pleasant humor of the mechanist. Writing to his partner, respecting one of the first steam engines put in operation in Cornwall, WATT says:—"The velocity, violence, magnitude, and horrible noise of the engine give universal satisfaction to all beholders, whether believers or not. I have once or twice trimmed the engine to end its stroke gently, and make less noise; but Mr. — cannot sleep unless it seems quite furious, so I have left it to the engine man. And, by the by, the noise serves to convey great ideas of power to the ignorant, who seem to be no more taken with modest merit in an engine than in a man."

CONTENTS OF THIS NUMBER.

AGRICULTURAL.	
Inquiries and Notes.—Hocks, or Haws; Gas Lime; Wash for Outbuildings.	197
The Outcrop.—Prince Edward Island Black Oats. Call for Oats.—Fragrant Oats, Green Mountain Oats, &c.	197
Kernel.—One Horse Mower, Illustrated.	197
Butter-Making.—Prize Essay.—Preface: Best Breed of Cattle: Influence of Feed, Exercise and Shelter; Dairy Salt; Milking the Cows; Dairy Apartment; Care of the Milk; Winter Care of Milk; Churning; Working the Butter; Final Packing.	197, 198

MOORE'S RURAL NEW-YORKER

NEWS DEPARTMENT.

ROCHESTER, N. Y., JUNE 18, 1859.

DOMESTIC NEWS.

Matters at Washington.

This Administration has not yet fully determined on its course of action pending the war in Europe, but has under consideration a declaration or statement of the principles by which the United States, as a neutral, will be governed. It clearly sets forth the just rights of American citizens engaged in peaceful pursuits of commerce, which, as far as possible, the Administration designs to protect. The precise positions which will be assumed, cannot now be ascertained, but they approximate to the principles heretofore declared, namely:—That free ships make free goods, contraband of war, excepted, and that the goods of a friend captured on board the vessels of an enemy, with the like exceptions, shall not be subject to confiscation, and that the rights of war ought not, in the nature of things, to extend further than to exact from neutrals the interruption of all trade with a blockaded port, and to subject articles contraband of war to capture and confiscation. The official exposition will involve the discussion of important questions, including that of blockade, as to how far this belligerent right should be exercised.

The Secretary of the Treasury has given notice that sealed proposals will be received until the 30th inst., for the issue of any portion or the whole of \$5,000,000 in Treasury notes in exchange for the gold coin of the United States, under the authority of the acts of Congress of 1857 and 1859, the interest not to exceed 6 per cent. The receipts of the Treasury for the week ending Monday, were \$1,263,000. The amount of the drafts issued \$1,718,000, and the amount subject to draft \$2,574.

A dispatch from Washington on the 11th inst., states that owing to complaints from the English authorities, of the inefficiency of our Navy in carrying out the treaty stipulations for the suppression of the Slave Trade, President Buchanan has determined to send to the Coast of Africa and Gulf of Mexico all the gun-boats now being built at the several Navy Yards.

Personal and Political.

Gov. Goodwin, of New Hampshire, in his late Message, congratulates the Legislature on the very small public debt of the State. It now amounts to \$73,886, having been reduced the last year \$17,700; also, upon the flourishing condition of the public schools, and upon the great improvements made within a few years past in agriculture. But, tho' much has been done and is done in this behalf, by the agricultural societies, there is ample room for further advancement, and as a means toward it, the Governor refers with much satisfaction to a plan in progress to establish an agricultural department in Dartmouth College.

New-Hampshire has also derived great benefit from the manufacturing establishments set up within her borders—in which is invested a capital of sixteen millions of dollars—by means of which towns and cities have been built up where, a few years since, there were no inhabitants. This busi-

ness is recovering from its late depression. Ligation seems to be on the decrease in the State.—The business of the Courts is so much diminished, that it might be well to inquire if some of the terms might not be discontinued without any detriment to the administration of justice. The banking system of the State is in a sound and satisfactory condition. The banking capital is five millions; the circulation three millions; the specie and specie funds upward of eleven hundred thousand. The Insane Asylum supports itself, as does also the State Prison. The House of Reformation for juvenile and female offenders promises to fulfill the objects of its establishment. Though the law against the sale of intoxicating liquors does not in its operation satisfy all the wishes of the friends of temperance, yet, it is a great aid to their efforts, and ought not to be disturbed.

The Democracy of Louisiana, met at Baton Rouge on the 25th ult., and after a stormy session of three days, nominated a ticket for State officers, in the selection of which the Slidell wing of the party seems to have triumphed by a small majority over the Soule faction. The result of the Convention was the nomination of Mr. T. O. Moore, for Governor; Mr. Hyams, for Lieutenant-Governor; Mr. Hardy, for Secretary of State; Mr. Semmes, for Attorney-General; Mr. Robertson, for Auditor; Mr. Deffense, for Treasurer; and Mr. Avery, for Superintendent of Public Instruction. The Convention adopted resolutions highly laudatory of the President, and adjourned.

After the adjournment of the Southern Convention a Society was formed for the encouragement of the Slave Trade.

The House of Delegates of the Virginia Legislature consists of 162 members. The election returns thus far received show that 77 Democrats and 50 Opposition members have been elected.

State Editorial Convention.

The Sixth Annual Meeting of the N. Y. State Editorial and Typographical Association was held in Convention Hall, Syracuse, on the 9th inst. About forty representatives of the press were present at the business sessions—principally from Central, Southern and Western New York—including the following named gentlemen:

Franklin Tutbill, N. Y. Times; D. D. Walle, Daily Republican Advocate, Batavia; J. Tarbell, Times, Oswego; N. Burrill, Transcript, Jordan; Oscar F. Knapp, Advertiser, Auburn; Isaac Fuller, Seneca County Courier, Seneca Falls; J. H. Belknap, Journal, Ithaca; J. J. Mattison, Ontario Messenger, Canastota; W. Johnson, Courier, Geneva; Henry Stowell, American Reveller, Seneca Falls; H. N. Beach, Republic, Brockport; N. T. Hackett, Niagara City Herald; W. T. Tinsley, Republican, Lyons; James T. Norton, Livingston Republican, Genesee; C. B. Thomson, Gazette, Le Roy; A. M. Clapp, Express, Buffalo; A. M. C. Chester, T. S. Treat, J. G. K. Treat, R. L. Adams, Journal, Syracuse; P. H. Agan, M. Summers, Standard, Syracuse; D. J. Husted, Courier, Syracuse; H. C. Page, Sentinel, Danville; R. Perry Staples, Republic, Brockport; W. J. LaRue, Times, Danville; H. M. Pettengill, New York; H. J. Mason, Ontario, Cohoes; Edward D. Van Slyke, Republican Banner, Cortland; C. G. Beach, Orleans Republican, Albion; R. K. Sanford, Patriot & Gazette, Fulton; O. Farchild, Bee, Ovid; Chas. Sentell, Seneca Observer, Waterloo; H. L. Tobey, Herald, Utica; Geo. D. A. Bridgman, Democrat, Penn Yan; S. C. Cleveland, Chronicle, Penn Yan; Mr. Brunel, Record, Dundee; D. D. Moore, Rural New-Yorker, Rochester.

The President, THOMAS S. TRUBAIR, Esq., of the Syracuse Journal, made a very happy and appropriate speech on calling the Association to order, and the proceedings were generally harmonious. Various matters pertaining to the interests of editors and publishers were introduced, discussed and adopted. Among the propositions submitted by the Business Committee, and adopted by the Association, were the following:

As a means of protection against imposition, it is recommended that in cases of strangers, liberating and new advertising agencies, &c., seeking to advertise, satisfactory references or advance payment be invariably demanded, and that advertisers failing to pay, be reported to the Secretary of the Association, and by him made known to all those present at this meeting.

Of the Advertising Agency, the firm of S. M. Pettengill & Co., is recognized as the first and most satisfactory, and recommended to the press for good prices and as a model advertising agency.

The Committee further recommended a strict adherence to remunerative prices, and a nearer approach to the cash system, by exacting prompt pay, believing long credit to be particularly onerous to publishers.

The following resolution passed by this Association, at its last annual meeting, is again submitted as worthy of being constantly kept before the minds of those conducting the press:

Resolved, That we regard it as the duty of the editor to cultivate more and more that kindly and courteous feeling that should ever exist among gentlemen; and that in the controversy of the day, may and political or otherwise, the personal of the editor should not be named, but ever sunk in his article or public course.

Buffalo was designated as the place for holding the next Annual Meeting of the Association, and the following officers were elected:

President—A. M. CLAPP, Buffalo Express.
Vice-President—J. Tarbell, Oswego Times; I. Burrill, Rochester Union; Jos. Warren, Buffalo Courier.
Wm. Stuart, Birmingham Republican; I. Fuller, Seneca County Courier; D. J. Hackett, Central City Courier; O. F. Knapp, Auburn Advertiser; J. H. Belknap, Ithaca Journal; H. L. Tobey, Herald, Utica; C. Comstock, Albany Argus; Alex. Mann, N. Y. Times.

Secretary—Jas. T. Norton, Livingston Republican.

Treasurer—T. S. Treat, Syracuse Journal.

Resolutions were unanimously adopted thanking the Press of Syracuse for the courtesy and hospitality extended to members of the Association, and complimentary to the retiring President.

In the evening an Address was delivered by Dr. F. TUTBILL, of the N. Y. Times, and a Poem by A. G. CHESTER, Esq., of the Syracuse Journal, to a highly pleased and appreciative audience. Both were excellent, and well worthy the four complimentary adjectives, (able, eloquent, instructive and appropriate) included in the resolution of thanks and request of copies for publication. We shall endeavor to publish extracts in a future number. The evening's exercises included the singing of several fine ballads by Mr. JAMES G. CLARK.

After the public exercises the members of the Association repaired to the residence of Mr. President TUTBILL, and spent an hour or two most pleasantly in social intercourse. A fine collation was partaken of, an unexpected serenade listened to, and a beautiful display of pyrotechnics witnessed. The occasion was apparently most pleasant to all participants.

The Press of Syracuse, and the hosts of the Voorhes House, Syracuse House and Globe Hotel, are entitled to the acknowledgments of members, for the courtesy and hospitality manifested. Those who remained over Thursday night, visited the Salt Works and Idiot Asylum on Friday, under the escort of Ex Mayor WINSTON and Messrs. CHESTER and HALSTED, and were highly pleased with what they saw of the works and institutions of the Central City—of which we may say more anon.

Conflagrations, Casualties, &c.

A FIRE broke out in Cincinnati, at 8 o'clock, on the evening of the 10th inst., in John Piper's tin shop, on Front street, and communicated to Mr. Jones's carpenter shop, and French and Wilson's feed store, all of which were destroyed. Loss \$25,000. At 2 o'clock in the morning, the saw-mill of Richard Swift, on East Front street, was almost destroyed by fire. Loss \$10,000; partially insured.

A FIRE broke out in Salem, Mass., at 1 o'clock on the morning of the 8th, in the stable of the Mansion House, in Essex street, destroying it together with 18 horses. The hostler, named Hatch, was burned to death. The stable of the Essex House was next destroyed. The Mansion House, the largest and oldest hotel in the city, was also destroyed, as well as a large number of smaller buildings, containing twenty stores and shops. The loss is estimated from \$100,000 to \$150,000.

The steamer John Lawton exploded near Savannah, Geo., on the 9th inst., killing the Captain, Pilot, Asst. Engineer, and John S. Montholin, a passenger, and a man named G. F. Barnwell. A number were scalded and bruised, some of them, it is feared, fatally. The number killed and missing is eight. The steamer is a total loss.

MISSOURI papers contain full details of the recent flood in the Mississippi. The damage done appears to be far greater than at first stated. The levee at St. Paul is entirely submerged, and at St. Anthony and Minneapolis, the storm and flood combined were terribly destructive. In the former place property to the value of several hundred thousand dollars was destroyed. The St. Anthony Water Co. lost 5,000,000 feet of logs, valued at \$40,000. The boom at Coon Creek, containing 10,000,000 feet of logs, is momentarily expected to give way. Logs to the value of \$13,000 went over the Falls during the three days previous. The river is twenty-one feet above low water mark, it being within a foot and a half of its height at the time of the great flood of 1850. The storms of the last week in that section of the country are described as the most frightful ever witnessed.

The steamship Edinburg, from New York for Glasgow, put into St. Johns on the evening of the 7th inst., with two of her compartments full of water, having struck an iceberg on Monday at 11.20 A. M., 180 miles east of St. Johns, in a heavy fog. The iceberg was first discovered directly ahead of the ship, being in lat. 47.40, lon. 48.20. The helm was put hard aport, and she passed close alongside without touching the part above water, but struck under water, a little abaft the port bow, and stove in one of her forward plates. The two foremost compartments filled almost immediately with water. The pumps were quickly set going and sails and bedding lowered over into the boats. All the male passengers assisted the crew in working the pumps and bailing. There was a dense fog all day Monday and Monday night, with rain—wind fresh, but sea smooth. At noon of Tuesday an observation was taken for the first time for three days, and the ship was found to be in lat. 47.41, N. lon. 50.29, at a distance from St. Johns of 47 miles. At 1 o'clock, made the land, all hands working vigorously at the pumps and bailing to keep the ship from sinking. The water was only kept from flowing into the other compartments, by incessant labor.

News Paragraphs.

The export of cotton to Great Britain this season is 500,000 bales larger than for the corresponding period of 1857; and the total foreign export is 640,000 in excess. This furnishes a basis to the extent of \$20,000,000 at least, in liquidation of indebtedness abroad; and makes amends for the short supply of grain.

The St. Johns News learns from reliable authority that orders have been received from England to dispatch the regiments of the line in Canada to England, and to break up the military stations at Montreal and Toronto. Quebec and Kingston are to be the only garrisoned cities, and the headquarters of the Royal Canadian Rifles are to be fixed at St. Johns.

GARIBOLDI, the white-haired leader of the Italian volunteers in the army of Sardinia, was exiled from Italy in 1849, and found refuge in the United States. A Western exchange says that he kept a coffee-house in Cincinnati a few years ago. He is now a General in the Sardinian service, commanding fifteen thousand men, and to a great extent controlling the destinies of States.

It has lately been discovered that the Post-Office Department loses about a million dollars a year by counterfeit postage stamps. It seems that there are two classes of persons engaged in this nefarious business—one which manufactures, either from engraved or photographed plates, and sells new postage stamps; and another, that gathers those which have been used, from waste paper collections, and by means of an acid washes off the Post-Office stamp that was put on them when they passed thro' the Office.

A Boston paper states that of 933 clergymen attending the late Anniversaries in that city, but 73 wore the professional badge, the white cravat.—The growth of hair on the faces of many of the divines, was another sign that they are willing to stand as men among men; and to find their appropriate distinctions in something of more consequence than peculiarities of costume.

The imports of dry goods at New York, during last week, amounted to \$1,296,087, against \$497,753 same time last year, and \$334,676 in 1857. The total for the year thus far is \$47,799,858 against \$42,082,586 in 1857, and \$19,769,641 in 1855. While these immense importations are made, trade is nearly stagnant. Millions of coin are flowing out, while luxuries are coming in at this prodigious rate.

The whole North American Continent has only 35,000,000 of inhabitants, hardly as much as France or Austria. The whole of Central and South America has only 23,000,000; less, then, than Italy. European Prussia, with its 60,000,000, has as many inhabitants as America, Australia and Polynesia together. More people live in London than in all Australia and Polynesia. China proper has more inhabitants than America, Australia and Africa put together, and India has nearly three times as many inhabitants as the whole of the New World.

FOREIGN NEWS.

From the Seat of War.

In the RURAL of last week we gave the particulars of the first collision (at Montebello) between the Allies and Austrians. Since that period we have been particularly favored with foreign arrivals, and the ball then opened seems to be kept up although a lack of spirit is observable. An official Sardinian bulletin says that the Sardinians passed the Senia in the face of the Austrians, who were fortified at Palastrio, after a severe conflict, and carried the place, making many prisoners. The Sardinians were under the command of King Victor Emanuel. Garibaldi was making some bold movements in Lombardy. On the 27th, after a furious fight of three hours, he entered Como. The Austrians retreated to Camerlatta, where the combat was renewed, and the Austrians again retreated towards Milan. All the steamers on the lake were in the hands of the patriots. It was reported, via Berne, that on the 29th, Garibaldi was defeated by a superior force, and withdrew into the Canton Tessin, but this lacks confirmation, and Turin dispatches give the impression that he was making further progress.

The *Moniteur* publishes the following telegram: "The Emperor is enjoying perfect health. We have but few sick. The weather is beautiful and the harvest is begun. The army is abundantly supplied, and the soldiers continue to feel full of confidence, and are in high spirits. The Emperor was about to remove his headquarters from Allessandria, and it was reported he would go to Casale."

GRAND BRITAIN.—The London *Post*, in reply to some statements as to Lord Palmerston and Lord John Russell being actuated by mutual rivalry, says the public may rest assured that if the Liberal party cannot act unitedly the fault will not rest with its chiefs.

The English Parliament met May 31st.—Speaker Denison was unanimously elected.

The terms offered by the Government to the Atlantic Telegraph Co. to be considered at the approaching meeting are $\frac{1}{2}$ per cent. guarantee for twenty-five years, provided the cable is in successful operation, at the rate of 100 words per hour, and they will pay \$20,000 per annum—the arrangement for \$24,000 per annum to stand good. The company in return surrender the exclusive privilege of landing a cable on the coast of Newfoundland.

The Red Sea cable was believed to have been successfully laid from Suez to Perim, a distance of 261 miles.

The London *Times* alludes to the designs on the part of the Viceroy of Egypt to take advantage of any disturbance which may arise in Turkey, for the purpose of obtaining, if not independence, at least a large measure of authority. The influence of France for the moment is supreme, but England will allow of no trifling in the matter. The slightest sign to evade the treaty of 1840, will bring down on the Viceroy the whole weight of England's power.

COMMERCIAL.—Breadstuffs.—Richardson, Spence & Co. report that the weather has been very favorable for the crops. Breadstuffs were declining. Flour was dull, and 2400d lower. The quotations are 11s@11848d. Wheat was also quite dull, and the prices were nominal. Unchanged. Western red 6s@106d; western white 10s@106d; southern white 10s@106d. Corn dull and neglected. Mixed western quoted 6s@6d@5d; yellow 6s@6d@5d; white 6s@6d@5d. Provisions continue scarce.

Clippings from Foreign Journals.

The French army in the city of Paris is larger than it was before the war.

AUSTRIA has recognized the neutrality during the war of the States of the Church.

The Vienna correspondent of the London *Times* says, Austria can keep 650,000 men on foot, Prussia 400,000, and the other German States 250,000.

The London *Times* Turin correspondent says the feeling there and in some other parts of Italy was particularly hostile to England.

A BATTALION of Hungarian volunteers, 2,000 strong, arrived at Vienna on the 10th of May, and were received with the most enthusiastic cheers by the people.

A VIENNA letter says that by the middle of June the Austrian army in Italy will probably be 325,000 strong, with 76,000 horses and 850 to 900 guns. A conscription of 100,000 men was expected to be made in Austria in a few days.

It is announced by the Suez Canal Company that the digging of the Isthmus of Suez commenced on the 25th of last month, and that the first sod was turned by M. Ferdinand de Lesseps, at the point determined on for the outlet of the Canal in the Mediterranean.

The London *Advertiser* states that Kossuth intended to quit England in eight or ten days for Hungary. He goes, in the first instance, to Genoa, with the full concurrence of the King of Sardinia and the Emperor Napoleon, and will then concert, with Gen. Klapka and other eminent Hungarian officers who are waiting to receive him, measures for throwing off the Austrian yoke in their native country, and for restoring its independence.

A DISPATCH from Vienna announces the death of the Ban Jellachich, famous during the Hungarian war as an unscrupulous ruler, and a firm adherent of the Emperor of Austria. No Ban of the Croats ever possessed such entire power over that wild, unruly tribe, as Jellachich. In spite of the life of warfare he had led, he was devoted to the arts and sciences, and was the inventor of the art of fixing the color on zinc by means of acid, now so generally adopted, and which, in France, has increased the value of zinc, according to returns of the *Vieille Montagne*, more than forty per cent. during the last few years.

FROM BRAZIL.—TERRIBLE STORMS AND TERRIBLE RAVAGES OF YELLOW FEVER.—Advises from Pernambuco represent that there has been a terrific storm on the coast of Brazil, and the whole coast from Bolivia southward was covered with wrecks, and the loss of life is terrible. A Brazilian frigate went down with over 400 on board, only 40 of whom were saved. The yellow fever is worse than ever at Rio. People are dying by thousands. The devastation among the shipping was unparalleled.—One English brig had lost five captains; the sixth was sick and not expected to recover.

The News Condenser.

- The prospects for a large harvest in Oregon are good.
- A knitting factory is about to be started at Oswego, N. Y.
- It is stated that M. Collard, a Parisian, photographs at night.
- The wheat harvest commenced in North Carolina on the 23d ult.
- Copper ore, very pure, has been discovered in Mo-Henry Co., Ill.
- The manufacture of silk was introduced in Europe in the year 651.
- Two boys only 7 years old have been arrested in Utica for burglary.
- The telegraph cable has been laid under the Red Sea from Aden to Suez.
- At the period of his retirement Mr. Buchanan will be seventy years of age.
- The European steamers week before last took five million dollars in specie!
- The vintage in Cincinnati bids fair to be the most prolific for many seasons.
- It is estimated that the Americans spend forty millions a year in pleasure travel.
- Incendiaries are at work in Hamilton, C. W., destroying barns and other buildings.
- The number of emigrants who landed in this country during last week was 5,331.
- The Spiritualists at Sturgis, Mich., have built a Gothic temple, costing \$3,000.
- Several dogs, supposed to be rabid, were killed within three days in Cincinnati.
- In New Jersey there is a good prospect of apples, pears, and cherries, but no peaches.
- A number of ripe watermelons were shipped from Charleston last week to New York.
- Eggs are selling in Minnesota at five cents per dozen, and potatoes at forty cents per bushel.
- Immense swarms of grasshoppers have made their appearance in different parts of Bucks Co., Penn.
- Henry O. Ware, of Youngstown, Ohio, entered a gas receiver to make some repairs and suffocated.
- Several lady editors are to attend the Editorial Convention which is to come off shortly at Milwaukee.
- An Italian translation of Mr. Longfellow's poem, "Evangeline," has recently been published at Florence.
- Count Teleki, the former Ambassador of Kossuth in Paris, has just left for Italy as a volunteer of the army.
- A French photographer has discovered a process for obtaining photographs of red, green, violet, or blue color.
- John A. Washington has received another \$10,000 instalment for Mount Vernon. About \$50,000 remains unpaid.
- Twenty-two steamships arrived at Boston, New York and Quebec, during the month of May, from Europe.
- The locusts have made their appearance in Egypt, or Southern Illinois, and cover the woods and orchards in swarms.
- In a recent pistol target shoot at Peoria, Ill., the ladies (Germans) entered the lists and took six out of the nine prizes.
- The Tiffin (Ohio) Tribune says that the wheat fields in that vicinity never looked better than the present year.
- Three cities, Chicago, Boston, and New York, have been the scenes of 44 murders since the 1st of January last.
- The library of a clergyman lately deceased in England, was valued at \$3, while his wine is estimated to be worth \$300.
- A lawyer from Iowa, late clerk in the general land office, is in jail in Milwaukee for forgery of Senator Douglas' frank.
- A Vienna letter declares that the subscriptions to the Austrian patriotic fund amount to 106,409 florins (about £10,000).
- The Haytian Legislature will not expel Boulouque for life, and President Geffard thinks of expelling the Legislature itself.
- The Italians residing in Richmond, Va., are forming an association to raise funds for transmission to their brothers in Italy.
- It is a startling fact that 80,000 out of 85,173 persons arrested for crime during last year in New York were intertempers.
- One of the little Aztecs, who have been exhibited in the United States and Europe, died early in May at Swansea, England.
- Mr. Joseph Roy, one of Napoleon Bonaparte's soldiers, died in Warren, Macomb Co., Mich., on the 10th ult., aged 76 years.
- Over 1,000 hogs died of cholera at Jersey Ferry, Ill., within a few months past. At last accounts, the disease was abating.
- It is reported that Lieut. Gen. Scott has made a bet of 500 bottles of champagne that Louis Napoleon will never return to Paris.
- A large-sized "elephant," with yellow skin, is now on exhibition in the vicinity of Pike's Peak, and is attracting many visitors.
- The Syracuse Courier tells of a hen's egg weighing one pound twelve ounces, which has been sent to that office for inspection.
- On Monday week four hundred and fifty dogs were impounded in New York, and before sunset they were all drowned. Poor Tray!
- Hallatones, from the size of a partridge egg to that of a goose egg, fell in Talladega Co., Ala., recently, doing considerable damage.
- The Oshkosh (Wis.) Democrat says that 57 new buildings are already under way in the district burnt over by the recent great fire.
- Charles W. Allen, of New Haven, has a coin taken from the ruins of Nineveh, which cannot be less than from 2,800 to 3,500 years old.
- The New York Historical Society are trying to raise \$34,000, necessary to complete the purchase of Abbott's Egyptian collection.
- The City Council of Boston have appropriated \$14,000 to defray the expenses of the public celebration of the Fourth of July this year.
- An emigrant, on his way to Pike's Peak, was fortunate enough to be struck by lightning lately before he had gone beyond St. Joseph, Mo.
- A mammoth butterfly, brought to Plymouth from Brazil, and measuring ten inches from tip to tip of his wings, has been sent to Prof. Agassiz.
- L. B. Towseley, the Children's Minister, has received since the injury which disabled him, the sum of \$13,197, contributions from various Sunday schools.
- Some papers have a queer way of talking. For instance, the Boston *Gazette* boasts of the "healthy growth" of a cemetery in that neighborhood.

With an Able Corps of Assistants and Contributors.

THE RURAL NEW-YORKER is designed to be unsurpassed in Value, Purity, Usefulness and Variety of Contents, and unique and beautiful in Appearance. Its Conductor devotes his personal attention to the supervision of its various departments, and earnestly labors to render the RURAL an eminently Reliable Guide on all the important Practical, Scientific and other Subjects intimately connected with the business of those whose interests it so assiduously advocates. It embraces more Agricultural, Horticultural, Scientific, Educational, Literary and News Matter, interspersed with appropriate and beautiful Engravings, than any other Journal.—readership is the most complete AGRICULTURAL, LITERARY AND FAMILY NEWSPAPER in America.

All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

For Terms and other particulars, see last page.

PRACTICAL SUGGESTIONS.

The Corn Crop is one that requires constant attention, and this consideration should be freely awarded, for we very much doubt if there be among all our farm products any one that will pay agriculturists better dividends for care bestowed than this. Cultivator and hoe ought not now be permitted to wear the garb of idleness—rust is the viper which stings the farmer's purse—nor will they where the largest possible yield is diligently sought. The ground should be stirred often (to prevent the growth of weeds which would rob both crop and husbandman,) and deeply, that the roots may extend and appropriate the moisture and fertilizing elements which would otherwise be denied them.

In this connection we may add a paragraph relative to corn for *soiling* purposes. Prepare any good strong soil in same manner as for full crop, mark with corn-marker in drills, and sow at the rate of four or five bushels to the acre—thirty or forty kernels to the foot. Take a light corn plow and run it each side of the drill, and the seed is covered. A Connecticut correspondent of the RURAL, who has for several years thus occupied any spare day between June 15th and July 1st, states that he has met with the best success in the use of either the Southern flint or Ohio gourd seed, these varieties attaining a much greater growth than any of the kinds commonly planted in the New England States. The only after-culture given is to run the cultivator or shovel-plow once between the rows, when the corn is from eighteen inches to two feet high. Cut and feed when the pastures are affected by summer drouths. By so doing plenty of room is furnished upon which to completely cure whatever may remain standing late in the season. If any attempts are made to preserve the surplus for winter fodder—for which it will prove of exceeding value—it must be spread very thin to prevent heating and mildew. The editor of the Springfield (Mass.) Republican last year tested Southern corn for this object, and thus relates his experience:—"About the middle of May last we planted the seed in rich heavy loam. By the middle of July it had grown nearly five feet in height. We cut some of it close to the ground and some of it twelve to eighteen inches high, in order to test its ability to produce a second crop from one sowing. We find that that cut close to the ground does not start, while that cut higher grows at the rate of about three inches a day. The younger the corn the lower it will do to cut it. We anticipate cutting repeated crops, of course each time higher up, until frost comes."

When it gets through raining and blowing cold—which it probably will one of these days—there will be a loud call upon the farmer from the hay-field, and this is one of that class of "calls" which must be received and responded to with promptness. When the heavens are propitious, and the grass in just the right condition for the commencement of operations, every man ought to "put in an appearance" immediately, and each implement be in readiness. There will be no time for repairs then—if mowing machines or scythes need an introduction to a mechanic, give it now—if rakes exhibit marks of last year's contest, and require dental improvement, let such measures be instituted as will attain the desired object to-day.

As regards the process of hay-making, our views have been so fully and frequently given in the RURAL that we will not at present trench upon the subject, except in one respect,—the manner of curing. There are men in this vicinity who, when they have a load to sell, are oftentimes compelled to stay in the "market all the day long," and never get as good prices as their neighbors (whose surplus may be readily contracted,) can command. The grasses cultivated by both parties are the same—the same heavens overhead and the same earth under their feet—equal opportunities are afforded each—then, why the difference? These things being so, it is evidently caused by carelessness or a lack of knowledge. The process of curing should, if possible, be perfected in the cock. Hay thus made retains more of the color and juices of the grass than when thinly spread over the field exposed to the rays of a burning sun. It should, if spread, be gathered into windrows or "foot-cocks" at night—dew falling upon it when scattered results in more or less injury. The chief point after cutting is to preserve it from dew and rain, as these soon wash away the soluble salts, and its keeping qualities are thereby seriously affected, for hay thus deteriorated ferments very readily when stacked. If the weather is unfavorable the less hay is shook about the better. It will preserve its nutritive properties for a considerable period of time if left undisturbed, but when submitted to repeated dryings and wettings it is soon utterly ruined.

The time for Weaning Lambs is fast approaching, as an inquiry upon the subject from a Pennsylvania subscriber indicates. When the facts that increased attention has been given to the growth of this species of farm stock in many portions of the country, and that an unnecessary degree of mortality is observable among the young at this period,—causing heavy losses to flock-masters,—is considered, a few words thereupon may prove of value, especially to the inexperienced. About four months from date of parturition is the time usually given the lamb to suckle in this latitude. This is governed somewhat by the breed, condition, and disposition to be made of the young. If of mutton varieties, and designed for the butcher, a longer or shorter period may be allowed, the rule being *fitness* for sale. The first thing is to separate ewes and lambs as widely as possible—they should be out of sight and hearing of each other. A better pasture must be provided (not too luxuriant, however,) for the young, as an equivalent for the loss of the mother's milk. Here is the spot at which many flock-masters fail. An opportunity to over-feed being given, the lambs gorge themselves, and acute diseases quickly decimate the flock. Where an error of this nature has been made, L. A. MONRELL, in *American Shepherd*, says all baneful effects will be "prevented if they have been previously trained to eat salt, which when given freely, operates much to counteract hoove, and some other diseases of the digestive organs. When lambs are first placed upon clover, give them all the salt they will eat. If this is done, the gases evolved, instead of acting as in cases of hoove, will pass naturally through the intestines." For the ewes, the poorest pasture should be selected for a week or two, else distension of the udders and inflammation, or garget, are likely to result. Should this prove the case, they ought to be separated from the rest of the flock and milked for a few days. In this department, as in every other upon the farm, the watchful, careful man will not only merit but meet with the highest reward.

NOTES AND INQUIRIES ABOUT POTATOES.

The Fluke and Prince Albert.

I ask that you state the Fluke and Prince Albert to be one variety. This may be, but the Flukes with me grow with large, rank tops, requiring rather poor land to check their growth, or wide planting, and I had been informed that the Prince Alberts were as good as the Flukes in all respects, and somewhat similar, but with shorter tops, and therefore better for close planting, and better in all respects for strong land.—S. S. Grecco, Monroe Co., N. Y., 1859.

The Fluke is always described in the English journals as being a "coarse grower." Indeed, the greatest objection made to it is being "too rank in the haulm," and when grown on rich land that the tubers are too large, and deformed. This accords with your description. You have, no doubt, the genuine English Fluke. The Country Gentleman, in noticing our recent article, says:—"The RURAL NEW-YORKER pronounces these two varieties identical, and thinks the change of name was given for purposes of speculation. Perhaps this is so. The potatoes considerably resemble each other, but our experience in growing each sort has resulted so differently that we have thought them different kinds. The Fluke turned out very poorly for the two or three years under trial, while the Prince Alberts, grown last season,

were a decided success. The vines of the first-named were dwarf and bush-like, those of the last of medium length, and the usual appearance. The product of the first was very small potatoes, though on equally good soil with the Alberts, which were mostly very large and handsome. We have seen Flukes of equally good appearance."

Our Albany friend must have grown his Flukes, with "dwarf and bush-like vines," on some of the "Albany barrens." If the Prince Albert grows more rank than the Fluke, it is not wanted in Western New York. But of their identity we have no question. We have tubers received under both names in our office, from different sources, and no person can tell the one from the other. We have them growing on the same soil, side by side, and our labels are the only means we have of distinguishing them. We have no question of their identity. If the Prince Albert is not the Fluke, who can tell where and when it originated?

Potatoes Mixing in the Hill.

Do potatoes mix by different sorts being planted together? Some say they do not. I think they do. Please settle the question through the RURAL beyond doubt.—L. F. H., Belfast, Alleg. Co., N. Y. 1859.

POTATOES will not mix, as supposed by our correspondent. Plant a set of a *Merino* and a *Maikan* in the same hill, and continue this practice for ten years, and you will see no change in the character of the two varieties. We have done this for several years. Potatoes raised from the seed of either would be likely to partake somewhat of the character of each, though this is uncertain. We have raised white, red, and black potatoes from the same seed hill.

Jenny Lind Potatoes.

I wish to make an inquiry about potatoes that I have just become acquainted with. It is a large, oblong potato, deep eyes, part-colored (red and white,) flesh white and mealy, yields well, but rots some. It is called the Jenny Lind potato. I wish to ask if that is the true name, and if it is a profitable potato to grow extensively?—Wm. C. MILLER, Silver Creek, Chaut. Co., N. Y.

We are not acquainted with this variety. Who can answer the questions of our correspondent?

DEEP PLOWING OF PRAIRIE SOD.

EDS. RURAL:—By reading your valuable paper I discover that the subject of "Deep Plowing vs. Shallow," is attracting the attention of practical farmers generally, and that both systems are being supported by intelligent men of the class above mentioned. In the RURAL of April 16th, under the head of "Deep Plowing of Prairie Sod," is an article, from the *Missouri Democrat*, stating that "recent experiments in deep plowing, with the Michigan double plow, have begun to create doubts as to the correctness of the idea of shallow plowing." Another from the *Prairie Farmer* states that "Mr. VAN DOREN says he gets more corn from one acre of deep plowing than from four ordinarily plowed."

That the first sod corn crop will be greatly increased by deep breaking, (say five or six inches deep,) I do not deny; but the question I propose is:—Does it pay through a series of years? I will try and answer it both experimentally and theoretically. Three years ago I plowed a field in Wisconsin that had been under cultivation twelve years, and yet the grass roots were more troublesome than those of an adjoining field which had been cultivated only one year. I inquired into the cause and was told that it was plowed too deep the first year. Last year I broke prairie, here in Kansas, at an average depth of three inches. In September when I went on with my harrow to prepare for winter wheat, I found the sod entirely rotted, and in as fine condition as I could wish. During the season I broke six acres for a neighbor, fresh from New York, who had not been initiated into Western customs, consequently it must be plowed six inches deep. His corn crop surpassed mine, I admit, but I observed him breaking it up again this spring with a heavy breaking plow and team, preparatory to another sod crop, while I am raising an "old land crop" (as we term it,) on one field—having plowed it with one yoke of cattle and light plow—while on another I have a fine crop of wheat, simply by harrowing my last year's breaking.

The reason that sod rots quicker in shallow breaking is obvious. But very little soil is turned over with the turf, consequently the grass roots are more exposed to the burning heat of the sun, and during the hot summer months are literally burnt up; while in deep plowing the roots are shielded from the sun by six inches of soil, thus rendering the decomposition of the sod almost impossible. Sod rots much better without a crop than with, but here, in this new country, corn is our main dependence for bread, and the newly arrived emigrant must raise it on sod, or not at all. Where sufficient old land can be obtained for

PATENT WIRE FENCING.

Though many of the attempts to introduce wire fence, during the past few years, have proved failures, the manufacturers of the Patent Lowell Wire Fencing, above represented, think they have succeeded in making a cheap and durable article. It is "made of annealed wire, formed by machinery into a strong network, the wires of which are so firmly twisted together at the union of its angles, that it requires a force equal to the strength of the material to dislocate or separate the meshes." The wires may be larger or smaller as desired, and the size of the open spaces may be varied, according to the use for which the fence is intended. The sizes of wire used in making the different styles of fencing vary from No. 8 to No. 14, and are said to be sufficiently strong and durable for the purposes for which they are designed.

After weaving, the fencing is coated with Japan, made of asphaltum, to prevent rusting. When completed for transporting, it is rolled up in bales containing from 20 to 25 rods each, and weighing from 200 to 300 lbs. per bale, thus making it the most portable fencing material in use. It is claimed that this mode of weaving the wire makes it much better than any other process. Unlike the fence made by running parallel wires from post to post, the woven fence is not expanded and contracted by heat and cold, as it acts on the principle of a combined spring. Indeed the manufacturers claim that it is "a practicable material for fencing, where the requisites are strength, closeness, elegance, portability, cheapness and durability." For railroads, highways and lanes it is claimed to be superior, as snow does not

drift by it. In some places it may be very desirable for lawn and division fences, where the owner does not wish to have the fence very conspicuous. For ornamental purposes it is said to cost about as much per rod as other kinds of iron fence cost per foot.

This style of fence is also made of galvanized wire, and presents a neat appearance. The cost of it when galvanized is of course somewhat greater than when coated with the black Japan. Various fancy structures and articles, such as summer houses or arbors, trellises and window guards, are made of the same material and serve a good purpose—are both ornamental and useful, as well as cheap.

These statements are condensed from a pamphlet furnished by Messrs. Z. ROSSMAN & Co., Boston, Mass., who are the General Agents of the manufacturer, and of course are not made upon our own knowledge of the fence. From the descriptions and testimonials given, however, we think the Wire Fencing worthy the attention of those interested, and any one can procure a pamphlet and other testimony, and judge of the merits of the article before purchasing. The above cut is No. 8 in the pamphlet. The sample represented is made of 10 and 14 wire, 2½ feet high, meshes 4 inches wide. Weighs 3½ lbs. per rod. Price, \$1.50 per rod. The fencing is made of different heights—from 16 inches to 4 feet, we believe—and costs from 75 cents to \$2 per rod, according to size of mesh and weight. We believe Messrs. Moore, Hazen & Co., of No. 74 Main street, Rochester, are Agents for the sale of the Wire Fencing in this vicinity.

corn, I think it more profitable to let the sod land rot without a crop until fall—then sow to wheat, as the heavy growth of corn stalks prevents the heat of the sun from reaching the roots almost as effectually as deep plowing. If the increased crop for one year on deep breaking compensates for the extra labor and decreased crops of succeeding years, why, then, break deep; if not (and I contend it does not,) break shallow, and thereby save time and money. After the sod has become decomposed, let the plow go down deeper, not ten inches the first "pop," as this is "running the thing into the ground," but increase gradually in depth each year until you get to the depth desired. Cottonwood Falls, Chase Co., Kansas. C. S. HILL.

THE APIARIANS.

E. KIRBY'S REVIEW OF MR. QUINBY'S CRITICISMS ON THE APIARIAN CONVENTION.

MR. QUINBY says that I am "ignorant of their natural habits," (that is, of the natural habits of the bee,) "and deficient in practical experience." He attempts to prove this position by an extract from an article which appeared in the RURAL of April 23d, entitled "The Apiarians in Convention." In that article I said that "they deposit their honey at the top of the hive," &c.; and that "after cold weather sets in they collect in the upper part of the hive, where they have previously provided and placed their food." In this I claim that I am right, that the expression I then made use of was correct, and that Mr. Q. is wrong. We both admit that capped honey is in the top of the hive, but Mr. Q., by his manner of quoting, makes me say that they cluster upon the capped honey—which I did not say nor imply, as I am perfectly aware that with the bee, food does not mean honey alone. I am sorry to think that the author of "The Book for Bee Keepers," and who appears to be so well acquainted with the English language, should either intentionally, or ignorantly, misinterpret an English sentence so perfectly clear and plain as the one which he has selected. He quotes a second time this expression of mine, "collect in the upper part of the hive, where they have previously provided and placed their food," by substituting the word honey in the place of food, and makes this change either carelessly or intentionally, so that it will better bear out the argument he is trying to advance. Now, I submit, that this using of quotation marks upon sentences that I did not utter,—sentences changed by inserting words which I did not use, to prove some-

thing that I did not say,—is not very fair reasoning, to say the least of it.

"All the twaddle," says Mr. Q., "about perverting the laws of God, amounts to nothing." To this "twaddle" I must add a little more. In Ecclesiastes, iii, 14, we find this passage:—"I know that whatsoever God doeth, it shall be forever; nothing can be put to it, nor anything taken from it." We cannot change the laws of God; they are unchangeable. In our dealings with the creatures that He has made, we must act in accordance with those instincts that God has given them; we must take those creatures and those instincts as we find them. "But," asks Mr. Q., "if man has nothing to do, if God has done all, why was it necessary for man to dress and keep the garden of Eden?" &c. I will answer it by saying that man, by violating the commands of God, brought sin into the world, and some of those things which he has to do, are parts of the penalties inflicted for that transgression. But I have not contended that man has nothing to do, or that God intended him for perfect idleness. He asks, "Why does man cut down the forests, why invert the soil?" &c., bringing up a number of examples in the vegetable kingdom, and reasons that from my argument it would appear that I would take all things in their natural state, without bestowing upon them the art of cultivation. These questions I regard as somewhat foreign to the subject, as I was treating, not of the Vegetable, but of a department in the Animal kingdom; and although the two kingdoms are somewhat analogous, yet in the main they differ pretty widely. But in regard to bees, any person who has read without prejudice the article which has given the gentleman so much trouble, in which I gave so minute a description of what I considered the best plan for protecting the hive, will see at once that I was by no means a stickler for having everything in its natural state, as the gentleman seems disposed to infer. I am really sorry that Mr. Q. has so far misrepresented my meaning, as he certainly has done, and I feel unwilling to think that he has done so willfully; but if he has done so, I can only remind him of the words of Holy Writ:—"Devise not evil against thy neighbor, seeing he dwelleth securely by thee." From the most reliable sources of historical information, no particular place or climate can be pointed out as the peculiar home of the bee, and therefore we regard Mr. Q. as having no authority for saying that the bee was "located by Nature in the sunny South." He is also greatly mistaken in supposing that bees are created for and placed in only a

—The article above alluded to was sent with directions to "print in your [our] next issue and send a dozen copies for distribution," etc. And in a private note our correspondent says:—"I intend to write other paper on the subject of preventing droughts, long-continued rains, by a systematic course of confining, conducted upon scientific principles!" We our friend *won't do so*—at least not until we recover from his first shock. We can't bear too much, even a good thing, and feel confident that (though it is the "Celebrus Fourth," the farmers of this "Ked'ntry" are too peaceable to beat their plow hooks and plows into cannon! Shooting the might possibly do, but the idea of killing both drought and rain with the same gun is too much of a stunt. Where is Prof. Ears, the "Storm King?" Hasn't mantle fallen upon D. N.?

HORTICULTURAL

CITY AND COUNTRY LIFE.

We love the country and country life—the green fields, the waving trees, the fragrant flowers, the grand old woods—even the stumps and rail fences and log cabins of the country. Here we see on every side the wisdom, power and goodness of the Creator. Here, as in the city, man with an unaccountable perverseness, often endeavors to deform what has been made so perfect and so glorious, yet thanks to the sparseness of population essential to the practice of agriculture, man, in the country, has not been able to obliterate the impress stamped upon nature and natural scenery by the GAZAR ARMOR of all beauty. The birds still sing in the tree tops, the sighing of zephyrs and the shouting of the tempest is still heard among the lofty pines, the brook murmurs on in its pebbly bed, and the water-fall continues to send up its silvery spray. Happy are they whose lot is cast in the country. They should appreciate the privilege, and sympathize with those who are imprisoned in large cities, where light and air and sunshine are admitted only in quantities barely sufficient to sustain life; where, instead of fragrance from the wild honey-suckle, the vine and the clover blossom, gutters and cellars send up their effluvia; and instead of the pleasant hum of the bees and the low of the cattle, is heard the clatter of horses' feet upon the stone pavement, the rumbling of wheels, and a confusion of cries. The poor and the rich alike have reason to rejoice in the glorious country, for the poorest log cabin or shanty may be clean and healthful, and it is the poor man's castle, sacred to him and his family. The broad acres on which it stands, the prospect from its windows, the wealthy of cities would give thousands could they possess.

We were led to these reflections by a report recently made at a meeting of the Sanitary Association of New York, showing that, on an average, over three families reside in each house in New York city, while there are about 14,000 houses that average six families to a house!

Three years ago the dwellings and buildings of all kinds in the metropolis numbered 53,000. The city is divided into 22 wards. In 1856, 19 of these wards contained a population of 535,027 inhabitants, divided into 112,833 families, averaging a little less than five souls in each family. For the accommodation of these 112,833 families residing in nineteen wards, there were 36,089 dwellings, averaging about three and one-half families to each dwelling. There are but 12,717 of these families occupying an entire house; 7,146 of these dwellings contain two families; 4,600 contain three families. Thus while 24,416 of these dwellings contain but 36,213 families, the remaining 13,623 have to shelter 76,620 families—averaging nearly six families to each house,—showing that about three-fourths of the whole population of New York live averaging but a fraction less than six families in a house, while only about one family in ten occupy a whole house.

The effect of living in this condition, upon the health, comfort and morals, we leave for our readers to imagine, if possible. From the bottom of our heart do we pity the poor children who have no green fields or lanes to run in, no dandelions or buttercups to pick; no opportunity to play in the meadow or the barn, or frolic among the new mown hay. And yet these city children love flowers, for it is a love which God implants in every heart, though the weeds of selfishness sometimes choke it in after years. The *New York Tribune* gives a very beautiful incident, showing how hungry the children of a large city are for flowers. Our old friend and correspondent, B. G. PANDER, who is now living in New York city, visited a day school last fall, when the Astors were in flower, and promised to save seed, plant them in the spring, and the present June to give each child a plant who would agree to set it out in the yard, or a pot, and take good care of it. A few days since, Mr. PANDER visited the school again, to see if the children remembered the promise, and not one had forgotten it.

"Now," said he, "I am ready to fulfill my promise. I have planted the seed, and God has blessed it and the object for which it was planted; for he loves little children. Now about these little plants. I can't pull them up and bring them here, because they will wilt, and perhaps die; but, as many of you as can find a place to plant one in the ground, and will promise me to take care of it, shall have one to-morrow at 5 o'clock, at my house in Thirty-fifth street. I will take them from the bed where they are growing, and wrap a little paper and dirt around the roots, and you can each take one in your hands and run home and set it out, and water it, and it will live and grow and bear flowers. But no one need come who is not willing to take care of it for months, and wait patiently for its flowers."

"I fear," said the teacher, "that they will be troublesome in going to your house."

"Oh, no; I presume of the thousands here, not more than a hundred will come."

In this he was mistaken; for before 4 o'clock the streets began to fill with children. They soon filled the steps of Mr. Pander's house, as well as those of his neighbors, and the sidewalks were lined with amateur florists. For two hours he labored as fast as possible to supply their little hands—the girls first, the boys, at his suggestion, generously giving way and quietly waiting their turn, until, instead of the anticipated one hundred, he furnished a majority of the whole school. For two hours, the street was a scene of great interest. Passers by stopped to gaze and wonder, and inquire what it all meant. The windows and doors of neighboring houses all exhibited curious faces, and eyes gleaming with pleasure at such an unaccountable scene in that quiet locality. Already had the flowers blossomed and borne fruit in the hearts of the children.

What a rebuke is this to those children of a larger growth, who, with abundant land and means, and every facility for making the desert blossom as the rose, never grow a single flower; and even pretend to think it manly to affect a contempt of such things as beneath their notice, and only worthy of women and children.

In the country it takes but a little means to make a tasteful and beautiful home. Land is cheap, and trees and shrubs abundant. A few weeks since we visited the village of Fairport, in the eastern part of this county, where D. B. DE LAND, Esq., has been making improvements, and ornamenting his grounds, and we were more than pleased with what we beheld. For more than a quarter of a mile, from the railroad to his residence, Mr. DE LAND has made a gravel walk, high, dry and well drained, planted with shade trees, and fenced, so that no stray cattle can injure it. West of his house are about eight acres of naturally heavy, retentive land, which has been too wet for successful cultivation, and this has been thoroughly underdrained with tile, and made as mellow and dry as can be desired. This has been planted with shade trees and seeded down to grass, in English Park style. Around the house is a velvet lawn, made by laying down turf, in which is cut tasteful flower beds for roses, verbenas, &c., while the lawn is ornamented with shrubbery. In the center stands a *Rustic Summer House*, thatched with straw in the old English manner. (Mr. D.L. traveled in Europe last summer, we believe, and this accounts, we suppose, for his taste in this and some other matters that have a decided English look.) Back of the lawn, and separated from it by an evergreen hedge is the kitchen garden, which has been thoroughly trenched, and well planted; indeed, all the work appears to be well done. And all these improvements, which command the admiration of visitors to that village, as we had good reason to know, when attending a Convention there recently, cost but about \$1,500. The people of the village could well afford to pay Mr. D. this amount, for it has been of far more advantage to village property than this. A few such improvements in the villages surrounding a city, and the denizens of the town will soon be attracted to them, in search of pleasant homes. But what would \$1,500 have done towards beautifying a city home. Four times this amount would hardly have purchased the materials for a three-story brown stone front, and after it was done it would have been lost in the crowd,—and been out-shown by more pretentious edifices. Let us be thankful that we have homes in the country, and improve the privileges we enjoy.

STRAWBERRIES.

We are now enjoying the *Strawberry Season*, and having spent several days among the beds, and taken some notes as to quality, productiveness, &c., we purpose to transcribe a few to our columns, reserving the remainder for a future occasion. Next week we shall be able to give a report of the Exhibition of the *Genesee Valley Horticultural Society*, and of the *Fruit Growers' Society of Western New York*.

Messrs. FROST & Co. have very extensive beds, and fruit this season over sixty varieties. H. E. HOOKER & Co. fruit all the best sorts. Their berries are well grown, and show what each will do with fair treatment. C. P. BISSELL & Co. have large beds of *Hooker*, and other leading sorts. ELLWANGER & BARNY have made this season a new and extensive Strawberry plantation, that next year will be in perfection, their old beds are consequently neglected, though producing very well. To all of these gentlemen we are indebted for such information as we needed to aid us in our investigations.

The *Hooker* maintains its reputation, we think, as a *high-flavored* variety, and a fair producer. *Burr's New Pine* is not much cultivated now, as it is considered rather tender, and not a first-rate producer. Of its quality there can be no doubt, and we prophesy that it will be more prized.

WILSON'S *ALBANY* sustains the reputation it gained last year, as a most productive variety, of rather ordinary quality. The two-year-old plants, however, in some beds, are producing little fruit, while in others they appear to be doing full as well as last year.

McAVOR'S No. 1, is of poor quality, but a great producer, almost if not quite equal to *Wilson*. We saw a bed in the grounds of MATHEW G. WARNER, Esq., four feet wide and twenty-five feet long, from which twenty-one quarts had already been picked. The proprietor had no doubt but he could pick as many more.

JENNY LIND is a good-flavored fruit, large, and as early as *Early Scarlet*.

TRIOMPHE DE GAND.—For three years we have watched this fruit, and this season we are prepared to recommend it as one of the best. Fruit of the *largest size*, generally conical, but the largest specimens flattened, as shown in the engraving, and often irregular and of cockscomb shape. Color blood red, becoming glossy crimson at full maturity; seeds yellow, and standing out from the surface. The flesh is quite firm, pale red, juicy, melting, musky and perfumed, partaking of the pine-apple flavor. It has a hard, glossy surface, and will bear handling better than any Strawberry we are acquainted with. It bears abundantly, and is a most desirable variety either for the amateur or market grower.

PRINCE'S *ECLIPSE*, a bright scarlet berry, rather inferior in flavor, but a good producer. The fruit-

stalks are very strong, keeping the fruit entirely from the ground, and the berries clean.

LONGWORTH'S *PROLIFIC* is a good bearer, and of good quality.

PRINCE'S *CHILLIAN* is a very good berry, and this season is bearing an abundant crop.

FILLBASKET, is a bright, showy berry, of medium size, and good quality. It gives evidence this season of being a good producer.

PRINCE'S *SCARLET MAGNATE* gives a good crop, but is of very poor quality. PRINCE'S *IMPERIAL SCARLET* is of very poor quality this season, and this is the only opportunity we have had of tasting it. DUC DE BRABANT we have observed for several seasons. It is early, ripening with *Early Scarlet*, large, conical dark crimson, glossy, with yellow seeds slightly imbedded in the surface. High flavored, like *Triomphe de Gand*.

THE BLACKBERRY.

SINCE the almost entire failure of our standard fruits, as apples, peaches, plums, &c., it becomes a matter of necessity as well as expediency to supply their place, at least temporarily, by the domestication and improvement of our native wild fruits. To do this successfully, a knowledge of the distinct varieties, and an intimate acquaintance with their habits of growth and fruiting, is necessary. To this end I have for two years carefully studied, with a wide range for observation, the habits and distinctive features of the wild *Blackberry*. I find four distinct varieties, each marked by well defined characteristics. The first is the *Trailing or Pine Blackberry*,—but as my object is to direct in the selection of plants of the only reliable variety, I have only to deal with three varieties that grow alike, and are intermingled, often on the same square yard, but differ widely in worth.

1st. THE *THORNLESS*.—The cane of this is smooth, or with only an occasional very small thorn. It rarely grows more than four feet in length—stocky at the base, but tapering rapidly,—generally bending over in a half circle, and branching considerably. It is the earliest variety in fruiting,—fruit short, of large, full globules, juicy, and very sweet, but is not a fruitful bearer. Only occasionally, and in favored situations, does it seem to fruit well, and a distinct feature in its fruiting is that the fruit all ripens nearly at the same time. On account of its shyness of bearing I could not recommend its cultivation, though this obstacle overcome, which cultivation might do, it certainly would rank high. Is not this the same, or similar to, *Newman's Thornless*.

2d. THE *LARGE LONG BLACKBERRY*.—This berry needs no description. The cane is thick, set with large thorns; it rarely branches, grows upright, and ranges from five to eight feet in height. Sometimes it reaches sixteen feet. This variety in any favorable situation and season, rarely fails of fruiting full, and continues in bearing from three to six weeks, and in favorable weather even longer. This is the *Blackberry*, but it also has the thorns.

3d. THE *PATER BLACKBERRY*.—I so name it, because it is false in its berry, being small, short, dry, and knotty; false in its thorns, being few and those slender, only about one-half the size and number of the large, long variety. It is false also in its case, having a more slender form, and never growing more than five or six feet high. It frequently grows intermingled with No. 2, and hence the need of careful discrimination in taking up plants, for No. 3 will always deceive the expectations of cultivators. H. H. DOOLITTLE. Oaks Corners, N. Y., 1859.

FRUIT GROWING IN MICHIGAN.

Messrs. Eds.—In reply to the inquiries of your "Subscriber" concerning fruit growing on the eastern shore of Lake Michigan, I would submit a few observations from my experience.

The lake shore country from St. Joseph to the Kalamazoo river is, beyond question, well adapted to the growth of tender fruits. Further south would be less sheltered by the lake, and further north would be, of course, colder. At St. Joseph the lake-protection does not extend far inland, one, two, or three miles at most, but in the region of the base line, some 80 miles further north, 15 miles from the lake, peaches, since first raised, (a dozen years ago), have never failed, while in the interior of the State, not only has the crop failed, but the trees themselves have mainly been destroyed. On the Kalamazoo river, peaches have been grown for the last twenty years without even a partial failure until last year, when the crop was very light. At St. Joseph, where peaches have been raised most extensively, they have had eminent success.

Our winters are not extremely cold—10° below zero being the coldest weather ever known at our place, and the banks and drifts of ice, which the prevailing westerly winds drive upon our shore, keep the atmosphere cool and the fruit buds back until all danger from frost is over.

The region spoken of is nearly all heavy timbered, yet it embraces every variety of soil, from light sand to heavy clay.

I might, were it not for trespassing too far upon the indulgence of the Editors, give many proofs and illustrations of the fact that we can raise tender fruits profitably here; and when the delicious freight is ready for exportation, we are within six hours steaming of one of the best markets in the world. Any one wishing further information may address the subscriber. A. S. DYCKMAN. South Haven, Van Buren Co., Mich. 1859.

AMERICAN PEARS IN ENGLAND.—Mr. RIVERS, writing to Mr. HORT, says, that the *Seckel*, *Moyamensing* and *Tyson* are the only ones that have proved really good. The *Seckel* they "make a standard of flavor."

FINE STRAWBERRIES.—We are indebted to Mrs. H. N. LANGWORTHY, of Greece, for a bountiful supply (for one day, at least,) of *Hooker's Seedlings*. This variety is always excellent when ripe, but these were voted extra by the family. S. BOARDMAN & Co., of the Rochester Nurseries, Brighton, have favored us with a dish of McAvor's Superior—large and fine-flavored.

CAUSE OF THE FLOW OF SAP.

FRIEND MOORE:—H. H. BARRETT's communication on the "Circulation of Sap," published in the *Rural* of April 16th, induces me to offer my views, since it is a question not yet decided, and one, too, about which theories are too apt to be based on hypothesis.

His argument is to prove the "cause for the ascent of the sap" in plants. He thinks capillary attraction is the true cause, and refers to experiments with tubes, sponge, sugar, &c. There is some resemblance certainly, but if this attraction is the true cause, why does not the sap continue to flow as abundantly during the winter as through spring and summer? And why does it cease when the tree dies? The roots and trunk are still composed of tubes, which are there in immense numbers, in a more favorable condition than can be represented by any experiment we can adopt, with dead or unvitalized matter.

In all our inquiries into the whys and wherefores of vegetable and animal growth, we can mostly discover the beautiful adaptation of the organization to an especial purpose. But the cause we cannot always detect separate from that All-pervading Spirit which can animate or vitalize all things.

It cannot be questioned that the sap flows from the roots up through the true wood to the leaves, and after exposure to the light flows downward next the bark, and deposits, in its progress, material for new wood and buds for the succeeding year. But like the blood in the human system, its motion and deposition of particles with such regularity, must be assigned to the vitality in the plant, whether that vitality is inherent to all parts or only the crown.

He remarks that DRAPER "has observed these motions occurring against the pressure of many atmospheres." The flow of sap will operate against the pressure of many atmospheres in the living plant, but take the vitality away, and the capillary attraction will fall far short of proving this assertion.

This can be tested with the grape vine, thus:—While it is in vigorous growth, cut the vine off six feet from the root—then tightly fix a glass or iron tube, four or six feet long, (open at both ends,) over the cut end, and the sap will be forced upwards until the tube is filled, and perhaps for a considerable time afterwards.

When this is fairly tried, take the vine and roots from the ground, and place them in a dry situation until the plant is entirely dead,—then place the roots in a tub of water and repeat the experiment with the tube. The result will be similar, and equal to the former experiment, if capillary attraction is the true cause for the flow of sap.

Chemists would long ago have imitated vegetable growth, did the flow of sap depend on capillary attraction alone, but their efforts, to form either vegetables or animals from inert material, have thus far been futile. Were we as well acquainted with the principle of growth, as is the cause of that principle, we then might operate without stumbling, and teach others to do likewise. Springdale, Lou. Co. Va., 1859. G. A. NEWBOLD.

BROOKLYN HORTICULTURAL SOCIETY.—The June Exhibition of the *Brooklyn Horticultural Society* was held on Wednesday, the 15th inst. From one of the *New York* papers we obtain the following facts:—This exhibition surpassed in all respects any of those in the month of June in former years. Mr. Langley, one of the Vice-Presidents, sent to the exhibition a black Hamburg vine in full bearing, although only a year old. Mr. John Ellis, of Hart's Corners, Westchester Co., exhibited several varieties of hot-house grapes, which received the highest premiums. A single bunch of black grapes weighed over five pounds. There were very choice strawberries, "Peabody's Seedling," from Dr. Thornton, of Brooklyn, which were entered too late for competition, but the beauty and large size of this variety attracted much notice. John B. Kitching, Esq., of Bay Ridge, made a very large and fine display, and took the first premium.

Among the flowers the most attractive were the orchids, from Dr. Knight, of New York, and Mr. Isaac Buchanan, of Astoria, and the hot house plants of Mr. B. were among the choicest exhibited. The President of the Society, Mr. John W. Degraw, exhibited a very elegant floral design, which ornamented the center table and attracted much attention. Mr. George W. Ingram, of Greenwood, had a display of roses, that has probably never been surpassed, although Mr. A. G. Burgess, of East New York, proved a very strong rival.

LARGE STALK OF VICTORIA RHUBARB.—I was this morning presented with a stalk of *Victoria Plant*, grown by A. FIRCH, Esq., of Riga, that I think worthy of notice. It measured 22½ inches clear of leaf, largest circumference 5¼ inches, weight 16 ounces after being cut from the root about two days. Entire weight of stalk and leaf two lbs., and the circumference of leaf twenty-two feet and six inches, with a natural diameter of two feet and ten inches. Beat this who can.—F. A. MARSH, Holley, N. Y., June 9th, 1859.

GAS IN TREES.—A committee appointed in New Haven, to examine the subject of the injury done to shade trees by leakages from gas pipes, report that forty trees have been killed in that city, from this cause, during the last three or four years, twenty-one of them last summer, owing to a flash of lightning which followed the pipes under ground and caused leaks.

BORERS IN MAPLES.—In certain parts of Maine, the locust tree borer (*xytus pictus*) has destroyed nearly all the locust trees. In another part of Maine the apple-tree borer (*aperda candida*) has destroyed whole orchards, which a very little pains-taking would have saved, had the farmer only known the habits of the insects. A borer very similar to the last mentioned, has done much damage to the sugar maples in Maine.—*Maine Farmer*.

THE STATE OF OHIO has purchased for her school libraries 1,000 copies of "Downing's Landscape Gardening," and 500 of "Darlington's Agricultural Botany."

CURRANT WINE.

No. 1.—Take ripe currants, wash them clean, clear them from the stems, and add a gallon of water to a gallon of fruit. Bruise them well in the water, and strain the liquor through a cloth. To one gallon of this liquor add two pounds and three-quarters of good brown sugar, and stir well. When the sugar is dissolved, put the wine in a cask not stoppered. When the fermentation is over bung it up tight, and in six (6) months it will be fit for use.

No. 2.—Take ripe currants, clear them from the stems, strain through a cloth. To every quart of juice add three quarts of water and four pounds of sugar. When the sugar is dissolved, put the wine in a cask not stoppered—the third day, (after filling it up with some of the wine reserved for the purpose,) bung it up tightly and let it stand twelve months unmoved, when it will be fit for use.

The above modes are both very good—the second being, on the whole, rather the best. Wine made according to it has been preserved, without any extra care, fifty years, perfectly sound—not a drop of spirit being added, none being necessary. That which was brewed in 1800 was found, in 1856, unexceptionable in every particular. This was owing to the liberal supply of good sugar, faithfulness in every stage of the process of manufacture, and the time allowed (twelve months) for it to ripen before it was bottled. Some persons purchase the lowest-priced sugar which they can find—saying that any sugar is good enough for wine, and thinking this is the cheapest. They are sadly mistaken. Low-priced sugar always contains much dirt, and dirt is not good economy at any price. The writer has known three instances, in two years, where it was necessary to add to the liquor afterwards a very liberal supply of sugar, in order to prevent its entire loss—the cost being much greater than would have been the case, (to say nothing of the additional labor and trouble,) had good sugar been used at the beginning. Good wine cannot be produced without good materials, and patient, faithful manipulation. It is often said that it can be manufactured for twenty-five cents a gallon. Perhaps it can, but one who regards economy, and his palate at the same time, had better keep his quarter and dispense with the liquor. It will never be decent *vin-aigre*, much less wine. Connecticut, 1859. O. W.

TO COOK BEEFSTEAK-COOKIES, &c.

Messrs. Eds.—Having read in the *Rural* a recipe for making Fruit Cake which I think is very good, I will add another that I know to be good:

FRUIT CAKE.—Take 5 eggs; 3 cups of sugar; 4 of flour; 1 pound of raisins, stoned and chopped; 1 of currants. Brown half of the flour and stir the other half with the fruit, add cloves, cinnamon, nutmeg, and a little allspice; 1 cup of molasses; a tablespoon of essence of lemon and a wine glass of brandy. This cake will keep a year or longer.

TO COOK BEEFSTEAK.—A very good way for cooking beefsteak is to take slices of beef, hack it with a knife instead of pounding, and then lay it in a spider, add pepper and salt, turn and press it while cooking. When done lay the meat on a platter. Add butter to the gravy, a little flour and water, stir it until it thickens and pour over the meat. This is better than broiling, as it saves the juice and flavor of the meat.

CAROLINA CAKE.—Take the whites of six eggs beaten to stiff froth, add 2 cups of white sugar; 2 of flour; 2 tablespoons of butter; 1 cup of sweet cream; 1 teaspoon of cream of tartar; ¼ do. of soda; 1 tablespoon essence of lemon. This makes a very nice and cheap cake.

CUSTARD.—Take 1 pint of rich sweet milk and boil it, then add the yolks of six eggs beaten with a tablespoon of sugar, stir into the milk until it is thick as you would like it—flavor with essence of lemon. MRS. E. ORANSON. Middlebury, Ind., 1859.

"No. 1" JUMBLES.—Rub to a cream a pound of white sugar and half a pound of butter; add eight well beaten eggs; essence of lemon or rose-water to the taste, and flour to make the jumble stiff enough for rolling out. Roll out in powdered sugar about half an inch wide and four inches long, and form them into rings by joining the ends. Lay them on buttered tins and bake in a quick oven.—MARY SEABER, Ypsilanti, Mich.

TO CLARIFY SUGAR FOR PRESERVING.—Put into a preserving pan as many pounds of sugar as you wish; to each pound of sugar put half a pint of water, and the white of an egg to every four pounds; stir it together until the sugar is dissolved; then set it over a gentle fire; stir it occasionally, and take off the scum as it rises. After a few boilings-up, the sugar will rise so high as to run over the side of the pan; to prevent which, take it from the fire for a few minutes, when it will subside, and leave time for skimming. Repeat the skimming until a slight scum or foam only will rise; then take off the pan, lay a slightly wetted napkin over the basin, and then strain the sugar through it. Put the skimmings into a basin; when the sugar is clarified, rinse the skimmer and basin with a glass of cold water, and put it to the scum, and set it by for common purposes.—*Selected*.

TO KEEP PRESERVES.—Apply the white of an egg, with a suitable brush, to a single thickness of white tissue paper, with which cover the jars, overlapping the edges an inch or two. When dry, the whole will become as tight as a drum. To prevent jams, preserves, etc., from graining, a teaspoonful of cream of tartar must be added to every gallon of the jam or preserves.—*Selected*.

THE ECHO.

BY ADRIAN STOUT.

Where, amid the opening flowers,
The light-winged zephyrs stray'd;
Beside a merry, tinkling rill
A little maiden played;
Where the brightest flowers grew wild
Sweetly sang the happy child.

Now, with rosy lips apart,
The bright-eyed maiden stood,
Listening as her merry notes
Were echoed through the wood;
Half in wonder, half in fear,
To hear the echoes silver clear.

'Twas no fairy's voice, my child,
Softly falling on thine ear,
But thine own sweet merry tones
Ringing in th' greenwood near;
The joyous laugh—th' silvery tone—
'Twas but th' echo of thine own.

So methinks we ever are
Waking echoes like the child,
And they ever come to us
Silvery sweet, or harsh and wild;
The notes of love, or angry tone,
Are but the echoes of our own.

Written for Moore's Rural New-Yorker.

Plain Talks to American Women.—No. 13.

BY MRS. M. P. A. CROZIER.

FOLLOWING, or accompanying, in a course of mental culture, the acquirement of the art of reading, we should advise that of penmanship. By the use of the pen, much knowledge which might otherwise be lost, may be permanently secured. In a course of reading, children should be encouraged to make frequent abstracts of the author's sentiments, and of the instruction conveyed in his work. Blank books should be furnished them for preservation, and in which they may be allowed to write out also their own reflections upon, and inquiries concerning, the subject which has engaged their attention. They may thus become accustomed, very pleasantly, to composition. And, as aiding further the easy acquisition of the latter very useful art, they should be permitted and encouraged to frequent letter-writing, and to the keeping of a journal of their daily life. This latter employment may also become the means, if conducted under the direction of a judicious mother, of exerting a powerful moral influence. The child's diary should ever be open to the maternal eye. How pleasantly might she spend a half hour each evening with her children, recalling the incidents of the day, the sources of their enjoyment, the lessons they have learned, whether physical, mental or moral, and assisting them in classifying and arranging all for an entry into their diaries. And it has occurred to us that a family journal, kept perhaps by some older member, might be useful. Here, on opposite pages, might be recorded the pleasant and the unpleasant incidents which have taken place, and memoranda made of everything worthy of special notice, as new ideas, moral sentiments illustrated, &c. In the moral discipline of the family, this might be made a powerful instrument for the accomplishment of good. And how pleasant, in after years, for the children to be able to look over these records of the past, to trace the growth of their own minds, and the advancement of their souls in the ways of wisdom!

In connection with reading and writing, spelling and defining will naturally be taught; then successively will the child be introduced to other studies. In everything there should be an aim at thoroughness—at mental discipline. The child should learn to think. It is thinking which constitutes the great difference between the intellectual giant, and the mental Lilliputian. The one may have had greater opportunities, but thinking alone has caused those opportunities to benefit him. It was thought that led GALILEO to the conclusion that the world moved, that led HARVEY to ascertain the fact of the circulation of the blood, that led COLOMBUS to the discovery of America, that led NEWTON to adopt the theory of gravitation, that led FRANKLIN to identify lightning with electricity, and MORSE to the invention of the Electric Telegraph. Thought has been the parent of all the noble works which fill our libraries,—thinkers have been the individuals whose names have been written upon "the walls of fame," and live in the hearts of a grateful posterity. Teach, then, the child to think—to reason—to investigate! When informed how an effect results from a certain cause, lead him to inquire also why it is so. This little word "why,"—frame it in gilt and hang it up in your school-room, a motto for each day's practice!

For the exercise of the reasoning and investigating faculties of her children, it would be well for the mother to have at hand a list of scientific and other questions, from which she may occasionally select,—say once a week,—one for their examination. This will add variety and interest to their studies. Care should be taken that the questions selected be adapted to the degree of advancement and intellectual discipline which the child has attained, that he may not be discouraged by repeatedly failing of success in his search for truth. Let them at least be such questions as he can answer in some way, and if he make mistakes, do not, by laughing at them, discourage him from trying again. Show him kindly, and carefully, how and why he is wrong, and be sure to give him due credit for all he deserves, in the patience, thoughtfulness, and thoroughness of his investigations. A word of encouragement from the mother, how like an electric thrill will it give new life to the desponding spirit! The child has, perhaps, labored hard, has become all flushed with excitement at the thought that he has achieved a triumph—how like a child will come over his heart the idea that all his toil has been of no avail! But guard with sympathy

thy the information you would convey of his error, show him that although his conclusion is wrong, yet he has done nobly in his search, and by further trial may very likely succeed,—if necessary put him upon the right track, and his ambition will be likely to remain unquenched, and he be ready for renewed effort.

But, while nothing discouraging should be said, and a great deal of encouragement given to the child, there is a limit to the praise which should be bestowed. He should be made to feel that it is his duty to do the best he can, and to look for his greatest reward in the approbation of God, and the consciousness of having done right. His mental attainments should not often be spoken of in company, and the parent should be watchful of the tendency to self-conceit. He should be made to feel how very little he knows of what is to be known, how very little the wisest of mankind have learned of the mysteries of Nature. Thus may his desire to learn be kept brightly burning, while his heart is humble. Thus will he occupy a teachable position, and there may be anticipated a rapid advancement in knowledge. But if the idea obtains with him that he already "knows a little more than anybody else," he will see little necessity of further exertion, and be likely to content himself with very imperfect culture.

Each mother should try to stimulate within her children the laudable ambition of "true nobleness"—the ambition to do something in the world. They should be reminded of their indebtedness to society, and of their duty to pay up that indebtedness with full usury; and this they should be taught it will be impossible for them to do if they lay away in a napkin the talent with which they have been intrusted, and repose in "imbecile idleness." Action, ACTION, should be taught them as the watchword of the true life. They should learn to look upon labor as the wise ordination of God, without which men would be the most miserable, as the most useless of beings. The pearls upon the temples of the humble laborer in the field should be in their eyes gems of the purest lustre—the silver threads that gleam out among the locks of the noble thought-toiler, as but the record of the lines of light which have radiated from his brain as sunbeams into the darkness of the world.

There is in the world too much of the pride of uselessness. It may not assume in any mind exactly this phase of appearance to him who cherishes it, but what else is that aristocracy which says "I am greater than thou," because of the wealth which releases my hands and my head from toil, because of my "lily hands" and unbrowned face? Oh, let us feel, let our children feel, that God made labor honorable when he created the world,—that Jesus Christ dignified it when he worked at the humble trade of the carpenter! Have not the truly noble of all ages had respect to this ordinance? Did not CINCINNATUS, after having toiled in the cause of his country, return to his toil at the plow? Did not WASHINGTON, after the most arduous labors as the Father of his Country, retire to his Mount Vernon, that he might labor on in the humbler avocation of the farmer? Why did not these heroes of patriotism, having seated themselves on the pinnacle of honor, fold their hands, and repose in the luxury of their own fame? They were too much men to do it. Never let us be guilty of giving to the world children who shall shrink from bearing their part faithfully, whether their duty lie in the field of manual or of mental exertion!

But something more than the desire to be, and to do, something more than a willingness to undertake duties which are "thrust upon them," must exist in the minds of those who would become truly great and wise. "The longer I live," remarks GORDON, "the more certain I am that the great difference between men, the great and the insignificant, is energy—invisible determination—an honest purpose once fixed—and then victory." We must arouse our children's energies. The genuine Yankee "go-a-head-iveness" should be stirred up within them; they must feel that to accomplish anything great, there must be great effort, and that the reward is worthy the toil! Point out to them how great have been the exertions of the HUMBOLDS, the WILSONS, the KANES, the MILLERS, who have so indelibly written their names upon the temples of science; of the WASHINGTONS, the JEFFERSONS, the ADAMS, and the FRANKLINS, who have engraven their names so deeply in the hearts of their countrymen; of the PAULS, the LUTHERS, the WESLEYS, the CHALMERS, the WHITEHEADS, who have done so much for religion; of the HOWARDS, the FRYS, the NIGHTINGALES, whose names will never be forgotten while human hearts bleed, and the angel of Philanthropy finds a dwelling-place in human souls.

But in order that the requisite energy be developed, physical health is almost indispensable. How can a mind dependent from childhood upon a poor, tired, weakly body, be expected to arouse itself to great endeavor? And how can a frame borne down by disease, sustain long the additional burden of laborious exertion? But let the vital forces be strong, let health bound like a mountain stream through the arteries, and then, with a mind properly disciplined, and a heart governed by Gospel principles, we may look for something worthy of humanity—of beings created in the image of God.

THE CHILD'S ANSWER.—Little Nellie L., had lost her father, and her mother was poor. Her sweet temper and her winning ways gained her many friends. Among them was an excellent lady, Miss N. A glimpse of Nellie's bright face peeping in at the door always brought a smile of peculiar tenderness over Miss N.'s placid features. She loved to sit by the child, softly stroking her hair, and while gazing thoughtfully into her smiling eyes, would often say, "Poor, poor Nellie!"

When Nellie shook her head, with a heart too happy to forbode evil, her friend would caress her still more fondly, and then say, "Poor little Nellie!" The child's heart seemed troubled by these pitying words, for she asked one day,—"Why do you call me poor? Please don't, Miss N. I'm not poor; why, I've got twenty-five cents and a good mother!" "Rich little Nellie," said her friend. "A good mother! Ah, how long I was in learning what this little one already knows." "A good mother"—could any earthly treasure have made her so truly rich!—Selected.

THE SONG OF OCEAN.

I love to sit at "eventide"
By the side of the "deep blue sea,"
And gazing out on the waters wide,
Catch the song they bear to me.
A mournful story they unfold
Of maiden fair and proud,
Lying there "in death so cold,"
With bridal dress for shroud.

They sing of mariner brave
Who sank 'neath the foamman's steel,
Chanting a requiem o'er his grave
When kindred may not kneel.

Of the sighs of those who languish
Morn and night upon the shore,
Shedding tears of bitter anguish
That their friends come back no more.

Of the hopes of many more
Watching for their treasures dear,
Friends beloved in days of yore,
Home returning—drawing near!

Telling of jewels rich and rare,
Of stores of shining gold,
Of countless gems that glitter there
In the halls of ocean old.

Whispering of scenes of murderous strife,
Oppressor's wrong and captive's woe,
Of savage lust and hellish life
That have marked their restless flow.

Telling of sleeping hate and love
Lying side by side in peace,
To wake at the call of Him above
When ocean's song shall cease.

West Macedon, N. Y., 1859.

Choice Miscellany.

THOROUGHNESS.

THOROUGHNESS is a quality indispensable to first-rate success in any business or pursuit. It is the product of energy, patience, and perseverance—energy to overcome difficulties and perform the hard labor; patience to wait for slow results, and endure the vexations that arise from losses and miscalculations; and perseverance to keep the mind, as it were, in the harness, when every influence tends to divert it from its proposed object. Thoroughness in the sales-room gives an aspect of cleanliness and order; gets rid of the rubbish on the shelves, and lades them with salable goods; attends with alertness to the wants of customers, dispatches duties with neatness and precision, and gives a business character to the establishment. In the counting-room it keeps with accuracy the books of the merchant, and regularly balances his accounts, keeping before him a statement of his affairs, exact, systematic, and correct, so that at any hour he may know whether he is on the safe waters of success, or hovering near the shoals of bankruptcy.

In the work-shop it produces the best specimens of art, and finds reputation abroad for the quality of its manufactures. It finds for the mechanic ready employment, and insures him the highest wages, while, at the same time, it adds to the correctness of his eye and the skill of his hand. It raises him by degrees from the condition of apprentice to that of employer, while his careless and less thorough fellow-workman remains, in truth, a journeyman, journeying from place to place in search of employment.

In the school-room it may not always distinguish the scholar who takes the prizes, or the lead in his classes, but it will not be found wanting in the one who is to make the man of strongest, soundest mind, or the one most likely to be "heard of" in the future. It is the thorough scholar, he that labors with a determined will to know all within his reach upon the subject he is studying, and not he that is ambitious to get over the greatest amount of text, who gets the discipline.

Thoroughness on the farm is the precursor if not the attendant of fertility and profit. It turns up the unemployed subsoil, converts the low-lands and swamps into fertile meadows and grain-fields, economizes in seed while it increases the productiveness of the soil, and surrounds the farm-house with choice orchards and convenient appurtenances.

In connection with any useful or honorable pursuit it is a quality which never fails to command respect. The thorough teacher is respected by his pupils and by his patrons; the thorough mechanic, by his employers and those who make use of his wares; the thorough business man, by all with whom he transacts business; and in all cases thoroughness is an evidence of good sense, and superior endowments of character.

C. B. C.

THE DYING NEVER WEEP.—It is a striking fact—the dying never weep. The circle of sobbing, agonizing hearts around produces not one tear. Is it that he is insensible and stiff already in the chill dissolution? That cannot be; for he asks for his father's hand, as if to gain strength in the mortal struggle, and leans on the breast of mother, brother, or sister, with still conscious affection; and just before expiring, at eve, after a long day's converse with the Angel of Summons, he says to his oldest brother—the last audible good night of earth—"Kiss me, kiss me!" It must be because the dying have reached a point too deep for our earthly crying and weeping. They are face to face with higher and holier beings, with the Father in heaven, and his angel throng, led on by the Son himself; and what are griefs of a morning, tears of a dying farewell—be it that they are shed by the dearest on earth—in that vision bright of immortal life and everlasting reunion!

If a man all his life-long should do no other good thing than educate his child right in the fear of God, then I think this may be an atonement for his neglects. The greatest which thou canst do is even this—that thou educatest thy child well.—Luther.

THE CHANGING SEASONS.

"For this the golden sun the earth divides,
And wheel'd through twelve bright signs his chariot guides.
Five zones the heaven surrounds, the centre glows
With fire unquench'd, and suns without repose;
At each extreme the poles in tempest tost,
Dark with thick showers and unrelenting frost;
Between the poles and blazing zones confined,
Lie climates to feeble man by Heaven assigned.
'Mid these the signs their course obliquely run,
And star the figured belt that binds the sun."
(Sotheby's Virgil.)

The contemplation of the changing year is to us one of deep and thrilling interest, perhaps rendered more so by the beautiful poetry of a THOMPSON, a BLOOMFIELD, a COWPER. A theme which, even to CHAUCER, and SPENCER, and SEAKS-PARR, and MILTON, was a passion. Spring, Summer, Autumn and Winter comes and goes—we heed them not as we should. Spring points to the seed-time, to the singing of birds, the humming of insects, the blooming of flowers, the green, grassy meadows. The sear and yellow heath puts on a new garb, beautiful and soft as the velvet down of other years. In reflecting on the beauties of spring, we are led to say with HOWARD, in his *Book of the Seasons*:—"Oh, that I could but touch a thousand bosoms with that melancholy which often visits mine when I behold little children endeavoring to extract amusement from the very dust, and straws, and pebbles of squalid alleys, shut out from the free and glorious countenance of Nature, and think how differently the children of the peasantry are passing the golden hours of childhood, wandering with bare heads and unshod feet, perhaps, but singing a childish, wordless melody through vervain lanes, or prying into a thousand sylvan, leafy nooks by the liquid music of running waters, amidst the fragrant heath, or on the flowery lap of the meadows, occupied with winged wonders without end. Oh, that I could but baptize every heart with the sympathetic feeling of what the city-pent child is condemned to lose; how blank, and poor, and joyless must be the images that fill its infant bosom to that of the country one, whose mind will be a mansion for all lovely forms, His memory be a dwelling place For all sweet sounds and harmonies!"

Spring-time is the loveliest of the year, all things start anew, all life is full of animation. The swallow skims the placid lake and sings to his nest in the wall. The glow-worm emits a tiny spark at nightfall to guide him in the shades of night. The robin builds her nest in the apple tree by the door; sings us sweet notes of music at dawn of day, and hops upon the old stone step to pick her scanty meal. The innocent lamb skips and jumps by its mother's side, while the shepherd pipes his horn to call his flocks from the neighboring hills, and leads them away to the fold. We talk of Spring, we read of Spring, and poets sing of Spring. Yes, our hearts grow glad at the approach of Spring when we read what has been written by our loved poetess, L. H. SIGOURNEY:

"Break from your chains, ye lingering streams;
Rise, blossoms, from your wintry dreams;
Drear fields, your robes of verdure take;
Birds, from your trance of silence wake;
Glad trees, resume your leafy crown;
Shrubs, o'er the mirror-brooks bend down;
Bland zephyrs, wheresoe'er ye stray;
The Spring doth call you—come away."
Fluvanna, N. Y., 1859. H. A. WHITTEMORE.

"THE SHADOWS WE CAST."

In this great world of sunshine and shadow, we are constantly casting shadows on those around us, and receiving shadows from them in return. There is no pathway in life which is not sometimes in the shade, and there is no one who walks over these paths, it matters not which way they tend, who does not, now and then, cast his shadows with the rest. How often do we, by a mere thoughtless word or a careless act, cast a shadow on some heart which is longing for sunlight. How often does the husband, by a cold greeting, cast a gloom over the happy, trusting face of his young wife, who, it may be, has waited anxiously for the first sound of his footsteps to give him a joyous welcome to his home. How often has the parent, by a harsh reproof, chilled the ever-flowing spring of confidence and love which is bubbling up from the fountains of the heart of the innocent prattler at his knee. How often are the bright rays of hope torn from the clinging grasp of the souls of those worn out by poverty and by the never-ending conflict of life, by the stinging ridicule, or the sordid avarice of those whom the world honors—aye, loves to honor. How often does the child—even after it has grown to the full bloom of manhood, and is clad in garments of strength and beauty—bring sorrow to the parent already tottering on the brink of eternity. Then beware, lest you cast a deeper shadow over those which are already darkening his happiness. The shadows we cast—can we escape them? Can we look back, as we walk on in life's journey, and see no shadowy marks about our footprints?

SIDNEY SMITH ON ENJOYMENT.—Mankind are always happier for having been happy—so that if you make them happy now, you make them happy twenty years hence by the memory of it. A childhood passed with a due mixture of rational indulgence, under fond and wise parents, diffuses over the whole of life a feeling of calm pleasure, and in extreme old age is the very last remembrance which time can erase from the mind of man. No enjoyment, however inconsiderable, is confined to the present moment. A man is the happier for life from having once made an agreeable tour, or lived for any length of time with pleasant people, or enjoyed any considerable interval of innocent pleasure, which contributes to render old men so inattentive to the scenes before them, and carries them back to a world that is past, and scenes never to be renewed again.

TAKE THE HAND OF THE FRIENDLESS; smile on the sad and dejected; sympathize with those in trouble; strive everywhere to diffuse around you sunshine and joy. If you do this you will be sure to be beloved.

GOD'S PROMISES.

BY JULIA B. SMITH.

WHAT sweet and gracious promises are made to those who trust in the Lord, promises that apply to every case, that meet our every want. God's sweet promises! what could we do without them? What a staff to lean upon when our path lies through the steep and rugged places of life—what an anchor to stay the soul when the tide of adversity rushes in upon us—and what a light to illumine our hearts in the deeper than midnight gloom of affliction's darkness.

"He maketh me to lie down in green pastures; He leadeth me beside the still waters." Oh, hapless wanderer, led by the ayren's voice over trackless wastes, weary from following the mirage of Pleasure, longest thou not for the green pastures, the balmy breeze, the overshadowing trees, and cooling waters? Unsatisfied as thou canst but be with earth's illusive pleasures, reach out for the Guiding Hand that would surely and quickly bring thee safe across the desert plains to fountains of living waters.

There is a happiness, there is a "peace that passeth understanding," that may be experienced, even in this world of sin and sorrow; but that hallowed peace oftener folds its wings in the straw-thatched cottage—in the haunts of poverty—than in the stately homes of affluence.

In the round of earthly pleasure
Trodden by the young and gay,
Long I sought the priceless treasure
Of a heart at peace at last.
Yet to me the search was ever
But a vain and joyless one;
Pure contentment deluged never
To abide in Pleasure's dome.

Sad, despirited, returning
From the gay, deluded throng,
In my heart-deeps woke there burning,
Sweeter words than ayren's song;
Words that thrill me through with gladness,
Words of charmed melody,
Quick disperse the clouds of sadness—
'Tis my Father calling me.

Kindest Shepherd, rough and dreary
Is the wanderer's dangerous track;
At thy call, careworn and weary,
To thy fold I hasten back;
Where the tender grass is springing
Close the cooling stream beside,
Where o'erhead the birds are singing
From the dawn till eventide—

Thitherward thy footsteps wending,
Thou dost gently lead the way;
In thy arms the young ones tending,
Lest they faint in noontide's ray.
Here it is that living waters
Quell the soul's tumultuous flow;
Here it is earth's sons and daughters
Only lasting peace may know.

Here may those, depressed by sorrow,
Lay their burdens down and rest;
Patiently the glad to-morrow
Waiting on the Saviour's breast.
From that fold, O Shepherd, loving,
Nevermore let me stray,
Till the hand of Death, removing,
Leads me to eternal day.
Upsonville, Susq. Co., Pa., 1859.

SABBATH BELLS.—Said Daniel Webster:—"I once defended a man charged with the awful crime of murder. At the conclusion of the trial, I asked him what could induce him to stain his hands with the blood of a fellow being. Turning his blood-shot eyes full upon me, he replied, in a voice of despair, 'Mr. Webster, in my youth I spent the holy Sabbath in evil amusements, instead of frequenting the house of prayer and praise.' Could we go back to the early years of all hardened criminals, I believe, firmly believe, that their first departure from the path of morality, was when they abandoned the Sabbath School, and their subsequent crimes might thus be traced back to the neglect of youthful religious instruction.

"Many years ago I spent a Sabbath with Thomas Jefferson, at his residence in Virginia. It was in the month of June, and the weather was delightful. I remarked, 'How sweetly, how very sweetly sounds that Sabbath bell!' That distinguished statesman for a moment seemed lost in thought, and then replied:—'Yes, my dear Webster, yes, it melts the heart, it calms our passions, and makes us boys again.'"

LITTLE GRAVES.—Sacred places for pure thoughts and holy meditation are the little graves in the church-yard. They are the depositories of the mother's sweetest joy, half unfolded buds of innocence, humanity by the frost of time, ere yet a single canker worm of corruption had nestled among its embryo petals. Callous, indeed, must be the heart of him who can stand by a little graveside and not have the holiest emotions of his soul awakened to the thought of purity and joy which belongs alone to God and heaven; for the more preacher at his feet tells him of life began and life ended, without a stain; and surely this be the spirit-land, enlightened by the sun of infinite goodness whence emanated the soul of that brief sojourner among us. How swells the heart of the parents, with mournful joy, while standing by the cold earth-bed of lost little ones!—mournful because a sweet treasure is taken away—joyful, because that precious jewel glitters in the diadem of the Redeemer.

REFUGE IN TROUBLE.—It is a poor relief from sorrow to fly to the distractions of the world; as well might a lost and wearied lord, suspended over the abyss of the tempestuous ocean, seek a resting place on its heaving waves, as the child of trouble seek a place of repose amid the bustling cares and intoxicating pleasures of earth and time.—Spring.

THE TRAVELER.

LETTERS FROM A HUNGARIAN.

NUMBER NINE.

Vienna (continued).—The Imperial Palace—Seeing the Emperor—The Royal Museum and Treasury—The Belvedere Picture Gallery and Antiquities—Circuits around the City Wall—Life in the Volksgarten—Marble Group by Canova—Environing of Vienna—Schubert's "The Prater"—Military Music—Departure for Prague.

DEAR FRIEND MOORE:—An entire week would hardly suffice for a survey of the most distinguished sights and scenes in and about Vienna, and yet I managed to enjoy the most within the space of half a week. On the day following my arrival I bent my way directly to the Imperial Palace, to see its vast treasures and monuments—the seat of Austrian Sovereignty since the 18th century. The palace, consisting of several somewhat irregular buildings built at different times, surrounds a large court-yard called *Francis Square*, in the middle of which stands an imposing monument of the Emperor Francis I. (died 1835), surrounded by allegorical figures of Justice and Valor, Peace and Religion. As I was beholding this group, a watchman at the outer gate cried at the top of his voice "Kaiser" (Emperor), and in a trice a guard of soldiers stood in array awaiting the appearance of their sovereign. The people in the court stood in mute silence, and dashing along came a stately chariot drawn by four horses and containing FRANCIS JOSEPH I, and one of his private counselors. All took off their hats—except one; for though I was in Rome I did not as the Romans do, but gazed with a feeling of awe mingled with disgust on him whose despotic sway I had but recently observed with my own eyes heavily pressing upon my noble countryman—the Magyar. The sight of that young but imperial brow recalled to my memory volumes of wrongs heaped upon the devoted land of the Hungarians, and I could not conscientiously join the crowd in presenting him a token of respect. After the Emperor was out of sight, the soldiers retired to their barracks, and I, with several others about me, entered the Museum connected with the court. Here, within the space of three hours, my eyes glanced rapidly over the vast zoological, mineralogical and astronomical cabinets. The zoological specimens are arranged according to the various continents of the world, whose animals they represent. The mineralogical cabinet, contained in three large halls, is one of the greatest collections in the world, numbering over 100,000 specimens, among which I noticed two meteoric stones found near Agram in 1751, and weighing, respectively, 70 and 100 pounds. Formerly the botanical collection, which is said to be equal to any in the world, was in the court-buildings also, but was removed some years ago to the garden of the University in one of the suburbs. The library, containing over 300,000 books and 20,000 MSS., and over 12,000 works printed in the early part of the 18th century, the immense collection of steel and wood engravings, coins, medals and antiquities generally, I passed without notice, as I wished to spend the remaining hour (from 11—12) in the Imperial Treasury. To obtain admission to this I was obliged to procure a card (gratis), the day before, otherwise you cannot enter without giving the porter a florin (about 50 cents.) Here the eye is dazzled by the numerous resplendent jewels, diamonds, gold and silver works. Here I saw, among other precious works of art, a large badge of the Theresian Order containing near 600 brilliants; the great diamond of Charles the Bold, of Burgundy, found after the battle of Grandson by a Swiss, who, not knowing its real character, sold it for a few florins, though worth 150,000 ducats; the silver cradles and wagons of the King of Rome; the imperial dress of CHARLEMAGNE; the sword of TIMON; the horoscope of WALLENSTEIN; the full dress of NAPOLEON when crowned King of Italy, and many other precious reliques of times long since past. Crowds of events recorded on the page of history, cluster about almost every treasure preserved, and the student may here revive his historic lore with ease and delight, though not without a tear of melancholy for those so-called great actors, of whom these reliques are almost the only things they have left to record their former existence on earth.

It was just noon when I finished my survey of these rich collections; and hastily partaking of a dinner at a neighboring restaurant, I entered one of the omnibuses standing around St. Stephen's square, (in Vienna, as in most European cities, the omnibus takes passengers at certain starting-places only,) and in about 15 minutes alighted at the celebrated *Belvedere* in the suburb *Wieden*. This was once the summer residence of Prince ERASMO (who died in 1786), and consists of two palaces separated by a large garden *à la Française*. The upper *Belvedere* (the palace most distant from the city wall,) contains a picture gallery of over 8,000 paintings of the several schools, among which the "Madonnas" play a conspicuous part, a Madonna of some one painter or another being found in almost every one of the twenty rooms of this picture gallery. The lower *Belvedere* contains the cabinet of Egyptian antiquities (mummies, coffins, sphinxes, papyrus-rolls, &c.) and the *Ambrosia* collection, so-called, from its having been originally in the possession of the Arch-Duke FERDINAND (16th century,) at the castle of *Ambrosia*, near Innsbruck. Here the eye is fatigued by over 1,000 portraits of distinguished men of the middle ages, over a hundred complete armaments as originally worn by Princes and Generals of those times, and numerous bronze and marble statues. I spent the whole afternoon in visiting these collections, and in the evening, before returning to town, refreshed myself by breathing the pure and balmy atmosphere of the large and charming garden connected with the *Belvedere*.

Before retiring to rest after a day of so much sight-seeing, I still ventured to spend the twilight in making a circuit round the city-wall. This I

did partly on the wall, partly on the *Glacis* (space between the latter and the suburbs,) beautifully laid out with rows of trees and grass-plots, and in company with a friendly cicero, who described to me the character of the numerous stately edifices and distant prospects which the eye here beholds to the right and left. The best place to begin this circuitous walk is at the magnificent *Burgthor* (gate leading from the court to the suburbs,) built after the manner of the *Propyleum* of Athens with 12 massive pillars of the Doric order and five passages. Turning to the left, I arrived, in little over an hour, at the *Paradies Garden* from which I passed to the *Volksgarten*, which is just to the right of the *Burgthor*. Here you could see the people of Vienna all alive, drinking beer or coffee, and listening to the band of music which still more enlivened the scene. Here you might also see specimens of the thirteen different nationalities composing the heterogeneous realm of Austria, with now and then a Turk in oriental costume, who is being educated in the various branches of art and science in the Polytechnic and other educational institutions of Vienna. Here I really enjoyed the cool, refreshing breeze of the evening, wafting harmonious music to my ear, as I too, partook of a glass of beer (which is most excellent here), and bread and cheese; and to crown the delights of the day, I took a view of the *Temple of Theos* (built here in Grecian style, by *Nonis*), containing a marble group (*Theos* slaying the Centaur) by *Canova*—one of the greatest master-pieces of modern art.

Thus pleasantly passed the second day of my sojourn in the imperial residence, where I was to spend twice twenty-four hours more. But of these I intended to devote about one-fourth to the environs, for the beauty of which Vienna is justly celebrated. The most charming of these, and one to which the citizens of Vienna are continually resorting during the summer months, is *Schönbrunn*, the favorite summer residence of the Emperor. An hour's ride with the omnibus will bring you to a spot, than which you can hardly imagine anything more charming and striking. The eye is here abundantly satisfied for that which it so much lacks in the city. At first view *Schönbrunn* ("fair fountain")—so-called, from the cool, beautiful well where the mighty hunter Emperor MATTHIAS, refreshed himself in 1619, and first conceived the idea of building a hunting palace here,) appears like a flower of a hundred beauties, spreading before you a slanting valley of parks and gardens, woods and hedges, with here and there a stately edifice or marble monument—the whole presenting a panorama of the most graceful combination of Nature and Art. But let us draw nearer and examine each beauty more closely. Taking our position in the center we behold the royal palace (which owes its present form to MARIA THERESA,) three stories high and near three thousand feet in length. The majestic court-yard, filled with rattling carriages and hurrying pedestrians, wending their way to the right and left, would of itself produce a much greater charm, did we not, through the open-arched gate beneath the principal balcony, see a most alluring perspective—the park with its fragrance and sunshine, its fountains and monuments—and in the rear, on the top of a sloping hill, the "Gloriette," seeming like a key-stone to this variegated scene. The *Gloriette* is a long, airy and fairy-like portico, from whose pillared platform the great Empress, MARIA THERESA, is said to have sent every morning a greeting signal to a favorite daughter in *Pressburg* (the castle now in ruins,) and received a similar one in return. Let us tarry here a little, and while we enjoy the fine prospect of the ocean of houses in the distance (Vienna,) and the still more distant hills of Hungary, think a moment of the great, cheering and mournful scenes that have taken place on the very spot and palace before us. Here the threads of the Seven Years' War were spun; here JOSEPH II, celebrated his hymeneal festivities; here Arch-Duke CHARLES mustered the brave troops (1801,) who were to meet the all-conquering forces of BONAPARTE, and here the great NAPOLEON himself, after his victorious career in 1809, took up his residence, while his successful marshals paraded their veteran army in the glistening sun. Here, too, the exile of St. Helena decreed that there is no more a *papal* Rome, and enriched Europe with another kingdom; and here, where his mighty father issued these decrees, lived and died the son, the "King of Rome," without Rome or any other kingdom.

To the right, in one of the labyrinthine gardens, is the rotunda with the menagerie containing living specimens of all possible monsters of Asia, Africa and America, and the everlasting, deafening screeching of parrots in the central pavilion. Here lounge about nurses with innumerable children; here you may see the comic peasant with staring eyes, apprentices and soldiers of all possible nationalities—and such faces as they make! The photographer might here make "a good catch"—say in front of the monkey-cage—worthy of being displayed in any picture-gallery. The elephant is continually busy with devouring the rich cakes bestowed by the gratified spectators. Natural history is here enriched with sayings and opinions at which a *Buffon*, a *Cuvier*, or an *Aoass* would shudder, and which "philosophers certainly never dreamed of." Near the menagerie is the botanical garden of European celebrity, with a great many hot-beds concealing a luxuriant display of the vegetable kingdom of all zones and climes.

To the left of the palace is another forest of trees with meandering paths and an artificial Roman ruin; which is, however, so skillfully built, that many a stranger has been led to regard it as a real ruin of some Roman edifice. From this ruin, which reminds us of Rome, the imagination is carried to the banks of the Nile by the projecting obelisk supported by four huge gilded tortoises; and half-way between the ruins and the obelisk is the beautiful fountain (from which the name of this spot is derived,) with the marble figure of a female so beautiful—even more so than the most beautiful *Venus*—that Pygmalion might have been justified had he stolen heavenly fire to animate this marble woman. This reposing, reclining form is worth a pilgrimage! And if any one is willing to make a fool of himself and sink down upon the bosom of a white marble nymph, let him come hither—here he may succeed.

But enough about *Schönbrunn* and—the reader

THE FALLS OF REGIA.

In describing the *Silver Mines of Mexico*, WILSON, in his *History of the Conquest of Mexico*, gives the accompanying view and description of the *Falls of Regia*, near which are extensive works for extracting silver from the ore:

"The *Patio*, or open yard of the Regia, on which the principal portion of the ores of the Real del Monte company are 'benefited,' or, as we should say, extracted, is situated deep down in a *barranca*, where both water-power and intense heat can be obtained to facilitate the process of separation. The immense amount of mason-work here expended in the erection of massive walls, would make an imposing appearance if they had been built up in the open plain; but here they are so overshadowed by the mason-work of nature, that they sink into insignificance, in comparison. The bank, some two hundred feet high, of solid rock, as it approaches the waterfall on either side, has the appearance of being supported by natural buttresses

of basaltic columns—columns closely joined together and placed erect by the hand of nature's Master-builder. Still, all would have been stiff and formal, had the sides of the *barranca* been lined only with perpendicular columns; but broken and displaced pillars are piled in every conceivable position against the front, while a vine with brilliant leaves had run to every fissure, and spread itself out to enjoy the sunshine. The little stream that had burst its way through the upright columns and flowed over the broken fragments, fell into a perfect basin of basalt, heightening immensely the attractions of the spot. I sat down upon a fallen column, and for a long time continued to contemplate the unexpected scene, of which, at that time, I had read nothing. There was such a mingling of the rich vegetation of the 'hot country' with the rocky ornaments of this pretty waterfall, that I could never grow weary of admiring the combined grandeur and beauty of the place."

will say,—enough about Vienna, too. I will not, therefore, trouble you with a description of what other things I saw in and about the Austrian capital. But before quitting it, let me speak of but one spot more which is the pride of Vienna—the *Prater*, in the suburb *Leopoldstadt*. This is the promenade of the aristocracy as well as of the people. I don't know how I can better describe it, than by comparing it to an immense outspread fan, the alleys running north, east and south far into the country and concentrating at the so-called "*Praterstern*" (star) at the end of the *Jägerzeile* the most fashionable street of Vienna. The principal alleys near a league in length, and are studded with several places of refreshment. The several alleys, of which there are five, are separated by green meadows, groups of trees, and in the more remote portions by little woods frequented by wild game. Here, then, I strolled about one Sunday afternoon, at which time the vehicles of the rich, and the more natural vehicles (legs,) of the poorer classes roamed about in vast numbers; though, as my companion told me, by no means to be compared with what it formerly was, when the numerous railroads traversing in various directions, had not as yet offered such cheap facilities for making excursions into the country. Happening to be in Vienna on the anniversary of the birth-day of the present Emperor, I witnessed a grand pyrotechnic display given to the public on one of the alleys of this *Prater*, accompanied by music from one of the numerous military bands of the capital. Speaking of music, I cannot help remarking that the military music of the Austrians is the most delightful I ever heard—far surpassing that of any other German city. And no wonder, for the military bands here are composed of regular *Hungarian* and *Italian* virtuosi; who, besides being exempt from the more onerous duties of the other soldiers, are at liberty to profit by their art by giving private concerts in the evening at the various resorts of pleasure. It is thus that the people are so fond of viewing military parades, where the glittering array of helmets and weapons, the precision and order of the movements, and, above all, the enlivening music, inspire the masses with love toward those very bodies which, at the bidding of a single man, did once ruthlessly turn their deadly arms against them for endeavoring to shake off the yoke that weighed upon them too heavily. Begging pardon for this digression, I will now take you along to the capital of Bohemia, Prague, whither the railroad hurries us through Moravia, in one of whose cities (Olmutz,) the noble LAZARETTE once experienced the sufferings of an Austrian dungeon, from which the magnanimous appeal of the "Father of our Republican Country" alone was able to free him.

And now, dear reader, I will weary you with but one more epistle about the wonders of another great city—the extreme western seat of the Slavonic race—Prague.

SIMON TOLKA.

THE THREE GREAT RIVERS.

LIEUT. HABERSHAM, in writing to the Philadelphia Ledger, says:

"The Mississippi, opposite New Orleans, is not quite six hundred yards wide, with a mean depth of one hundred feet; and a velocity of one and a half miles per hour. Thus, a body of water one and a half miles long, six hundred yards wide, and one hundred feet thick, is driven into the Gulf of Mexico every hour. A little more than one hundred miles from the mouth of Yangtse-Kiang, (the Son of the Sea,) is located the city of Kiang Yun. The river here is one thousand nine hundred yards wide, has an average depth of ninety-nine feet, and a mean velocity of two miles per hour. Thus, we have, he remarks, a body of water two miles long, nineteen hundred yards wide, and ninety-nine feet thick, hourly urged into the bosom of the Yellow Sea. Compare this volume with the first, and it will be found to be almost double. Were the length of the great Chinese water course only known, the comparison might be completed, but that cannot be until the interior of China is open to the world. Its estimated length is three thou-

sand three hundred miles. Lieut. Habersham estimates that the waters of the Yangtse-Kiang carry along in suspension the remarkable quantity of thirty-three per cent. of sedimentary matter. According to this estimate, 1,985,330,000 cubic feet of mud is hourly transported to the sea by this river. It seems quite incredible, but as the earthy matter discharged by the Yangtse-Kiang colors the waters at its mouth, giving to them the name of the Yellow Sea, besides forming immense flats, the amount must be very large. The Yangtse-Kiang, however, bears no better comparison to the Amazon, than, according to Lieut. Habersham, the Mississippi does to the Chinese river. The Amazon, which is the largest river in the world, is one thousand seven hundred and sixty-nine miles in length, in a direct line, or, including its windings, nearly four thousand miles, while four hundred miles from the Atlantic it is more than a mile in width, and has a velocity of three and a half miles per hour, and in mid-currents no bottom is found within twenty fathoms, or one hundred and twenty feet. This noble river, with its tributaries, is estimated to afford fifty thousand miles of inland navigation."

YOUNG RURALIST.

STUDY AND LABOR.

MESSES. EDS.:—VINTON, in a late *RURAL*, (14th ult.), asks in substance the following question:—"Can a young man study his books while working on the farm?" Now, there are two things to be considered in this question. 1st, Can one find the requisite time? and 2d, Would not his daily labor detract from the interest in his studies? I should say, to come to the point at once, that there was at least no regular time for study during summer on the farm—that being, I suppose, the season to which VINTON refers, as he probably attends school during the winter. Where one labors steadily from the sun's rise to its disappearance, it is evident that evenings would be the only opportunities obtainable for this purpose; but these in summer are quite short, and furthermore, if I can be allowed to judge of others by myself, one wants three of these evenings at least, out of each week, to devote to our weekly visitors, the *RURAL*, *TRIBUNE*, &c., as a good stock of general information is more of a present necessity, to the youth, than a knowledge of the languages and sciences. This last assertion, however, might be a matter of opinion, and some ambitious youth would raise the inquiry, Why not study and let the papers go? If one can forego the pleasure of reading, why not substitute study in its stead? Because one is a recreation and the other a labor; the one requires no effort or exertion while the other does; and Nature would argue strongly against the practice of studying evenings after a steady day's work. She designed the night as a period of sleep and rest from labor, mental as well as muscular, and an observance of this law of Nature is rendered imperative in the case stated. It cannot always be disobeyed with impunity, and to persist in disregarding it would soon begin to tell on the health and *weight* of the individual. I should advise VINTON, therefore, not to study evenings, during the seasons of the hardest labor, at least.

But "circumstances alter cases," and perhaps VINTON is so situated as to have some portion of the day itself for study, in which case what has been said would, of course, not apply. But, although there may be obstacles in the way of our having regular hours for study, there are sundry other odd moments of leisure, which, if one bears in mind that "where there is a will there is a way," can be improved to the decided advantage of one's knowledge. A sudden shower may come up while at work in

the field, and send one to the house for an hour or so; rainy days are frequent, though he is a poor farmer who cannot find work for his boys on such days.

The second consideration I based somewhat upon the supposition that if during the muscular labor one cannot think over or digest what he has been learning from his books, his studies would be less interesting than if the reverse were the truth; and such is the case, though it is dependent in a great measure upon what the studies are. This consideration, also, involves the one which VINTON illustrates, though it would hardly seem to me that the instance he mentions afforded such "conclusive evidence" to the truth of it as he states. On the contrary, he can go on a similar errand, think over his reading as before, and my word for it, he will not again fall into that predicament, unless intentionally. His experience will teach him better, and I believe that in some cases two employments can be pursued at one time with profit; to be sure, neither will be done as well as when our whole attention is directed to one alone, but the advantage derived from both would more than make up the deficiency. In planting or hoeing corn, for example, it is well nigh impossible to keep the mind steadily fixed upon the work. One's thoughts will be running upon something, and better by far have them engrossed with what we have read from some useful book, than with the interminable yams of some gossiping fellow who can readily be distinguished from the rest by his being furthest behind with his row. But, there are also other kinds of work which require the head as well as the hands, and on the whole, in view of these facts, and also that we are most of us differently situated as regards the amount of time we can obtain for the purpose of study, we should have to rely on our own judgment, as no particular rule could be given. Let us by all means study all we can as far as it can be done without affecting our health; but we should seek to preserve that first, for of what benefit would be the best education if obtained at the dear cost of life or reason?

VINTON seems to make a distinction between studying and reading, as far as acquiring knowledge is concerned. It seems to me that no such distinction exists, or rather as much advantage is obtained from the one as from the other, where the reading is pursued as it should be; and for directions how to read correctly, I would refer VINTON and others to the article in the *RURAL* of April 16th, second column. These rules I have practiced, and can testify to their value, as I have found them a great improvement over the inveterate old habits of skimming over, which, like all such old habits, it is extremely difficult to overcome.

One more remark upon VINTON's article. If my inferences are correct, there appears to be some inconsistency in the course he is pursuing, as his studies hardly seem to accord with his intended occupation. Ancient history, I believe, is included in the classical course of study, as well as the dead languages; and if these are the studies he wishes to pursue or is pursuing in the place of those which are far more applicable to his profession, then, I must say, he is taking an improper course. One of the ancients, when asked what things boys should learn, replied, "those which they will practice when they become men." Now, if VINTON is calculating to become a lawyer or a minister, he is on the right track; but he is to be a farmer—and one who intends to make that his calling, should pursue those studies which really are applicable to our profession—viz., Agricultural Chemistry, Botany, Meteorology, &c. This would do away with the objection raised by VINTON, of the impossibility of doing two things at a time with profit; for in this case the two employments would in fact be but two branches of the one. From the books we learn the science of what we are daily practicing and experiencing.

LIVONIA, N. Y., June, 1870.

The following is the article referred to by our correspondent, and which he has so long remembered with profit:

HOW TO READ.—Think as well as read, and when you read. Yield not your minds to the passive impressions which others may please to make upon them. Hear what they have to say; but examine it, weigh it, and judge for yourselves. This will enable you to make a right use of books—to use them as *helpers*, not as *guides* to your understanding; as *counselors*, not *dictators* of what you are to think and believe.

ADVICE TO THE BOYS.

Now, boys—farmers' boys I mean—clear your upper stories, as soon as may be, from thoughts of a "good time coming," break yourselves of the habit of day-dreaming, of forever picturing to yourselves a "rose-tinted existence" in the future. These *vague* pictures of future success fill the mind with *vivid* pictures of present ills. Dreaming of "purple and fine linen" makes blue jean and cotton altogether intolerable. Don't imagine that happiness is a tenant of any of these "air castles," but exactly the reverse. The reading of the greater part of the fiction of the present day has a tendency to fill the mind with visions of coming good. Clear your libraries of all such trash, and clear your heads from a desire to read it. What is it to you if "a solitary horseman was seen wending his way along the skirts of a forest," or if Miss JUVENILLA FANDANGO, "wearing with the festivities of the evening," did "retire to a shady recess." It will not add one cubit to your intellectual stature to read of a hundred such "remarkable events."

The habit of roving is a dangerous one, too. To the unsettled there is ever a good thing a little ways ahead. The rover will travel one weary round, and often make his starting point his final resting place. Spend your "rainy days" in reading something worth remembering. If your father does not take a good agricultural paper, take one yourself. You cannot be a farmer without. Commence early the practice of corresponding with your friends; this is of much importance. It learns you how to spell, to write, and more than all, it learns you to think.

CASTLE CENTRE, N. Y., 1859.

Never open the door for a little vice, lest a great one should enter.

TERMS, IN ADVANCE:
One copy, 1 year, \$2.00
Three copies, 1 year, \$5.00
Six copies, 1 year, \$10.00
Twelve copies, 1 year, \$20.00
Twenty-four copies, 1 year, \$40.00
Forty-eight copies, 1 year, \$80.00
And an extra copy, free, to every person remitting for a club of thirty or over. As a new Half Volume commences next week, now is the time to form clubs for either Six Months or a Year. All persons who form new clubs to commence with July, or introduce the Rural in localities where it is not now taken, will be liberally remunerated for their time and attention.

Back numbers from April or January can still be furnished, if desired. We will send Specimen Numbers, Show Bills, &c., to all applicants, and to the addresses of as many non-subscribers as may be forwarded.

MOORE'S RURAL NEW-YORKER

NEWS DEPARTMENT.

ROCHESTER, N. Y., JUNE 25, 1869.

ANOTHER HALF VOLUME.

Announcement to Agents and Subscribers.

AGENT-FRIENDS, Subscribers, and all others interested, will please note that this number closes the first half of Vol. X of the Rural New-Yorker. All whose terms expire this week will find "Time Up" printed on the margins of their respective papers—and we trust each and all so notified will not only be disposed to renew their own subscriptions, but that many of them will form new clubs, thus furnishing the Rural at a low rate to neighbors and friends who have long desired it, and only waited for an invitation or favorable opportunity to subscribe. "Where there is a will there is a way" and every one addressed who has the welfare of the paper, the cause it advocates, and community at heart, can, by a little timely effort, secure a club of six to thirty, and thereby promote the interest of all parties. Some have already renewed and enlisted new recruits, and we hope the remainder, and our Agents generally—to whom we are largely indebted for the remarkable prosperity of the Rural this year—will give the matter such timely attention as may be consistent.

THE NEW HALF VOLUME, commencing July 2d, will not be inferior to either of its predecessors—and the one now terminating has been more warmly commended and approved by Subscribers and the Press than any before published. Our aim is to improve as we advance, and we never possessed such ample facilities as now, for the successful prosecution of the enterprise in which we have been so long and ardently engaged, nor a greater desire to maintain and augment the pre-eminence of the Rural New-Yorker in all the essentials of an AGRICULTURAL, LITERARY AND FAMILY WEEKLY. The extraordinary success of the Rural has created in some sections a spirit of envy and jealousy unworthy any one engaged (as all rural journalists should be) in similar efforts to promote the Best Interests and Home Happiness of the Rural Population, yet every exhibition of this animosity has increased its circulation and consequent influence and usefulness, and we shall endeavor to wield wisely and well the power and responsibility with which we are thus endowed. And we again frankly ask all who believe this Journal is doing good—that it is enhancing Rural Progress and Improvement, and worthily fulfilling the mission of an instructive, Entertaining and Useful Visitor to the Family Circle—to lend a portion of attention and influence to extend its sphere of usefulness, and thus augment its benefits to community.

DOMESTIC NEWS.

Matters at Washington.

The views of the Administration as to the rights of naturalized citizens who may return to Europe, have been promulgated by Gen. Cass in a letter to the State Department. The Secretary states that this Government will not interfere in cases where individuals voluntarily return to countries to which they owed military services at the period of their departure for the United States.

The State Department has received advices from our Minister at Chili, giving all the facts relative to the seizure of the schooner Townsend Jones. The Administration has sent instructions to our Minister to demand reparation for the revocation of the exequatur of the American Consul at Valparaiso, and a man-of-war has also been ordered to that port.

The ordering of a more efficient naval force to the African coast was not in consequence of any late complaints by the British Government. It was long ago contemplated, but until recently there were no vessels which could be used for that purpose. So far as our Government is aware, no new orders have been issued by the British Government since 1849, in connection with the treaty stipulating for the suppression of the slave trade on the coast of Africa.

A despatch from Washington to the Tribune says Government has determined, if next advices from Texas contain a confirmation of the report of continued hostility with the Indians, to remove them immediately to the reservation of the West. Choctaw settlement. The outrages on the Indians have been committed by an organized band of white outlaws who desire their lands.

The proposals for the \$5,000,000 Treasury Loan were opened on the 20th inst., by the Secretary of the Treasury. There were upwards of forty bidders, and about \$13,500,000 bid for \$2,000,000 were awarded under 6 per cent., viz.—from \$4 to 5 per cent., and \$100,000 at 5 per cent. All the other bidders proposed 6 per cent., among whom

the remainder of the loan will be proportioned pro rata.

The Collector of Baltimore has applied to the Secretary of State for information as to the nature and extent of the protection which may be afforded by the United States to a foreign built vessel, purchased by an American citizen. It is understood that our Government entertains the views held by the last Administration, viz.—That if an American citizen buys, in good faith, a vessel from a belligerent or neutral power, with whom we are at peace, it becomes American property. The vessel, however, cannot get a register unless by the act of Congress.

A despatch from Washington states on probable authority, that Mr. McLane has negotiated a treaty with Juarez, ceding to the United States the States of Sonora and Chihuahua, and a part of the Tamaulipas, the United States engaging to assist the Liberal party and to pay the claims within a limited amount, to be ascertained by a Mexican Commissioner. The treaty is expected within a month.

Conflagrations and Casualties.

A destructive fire occurred at Toronto, C. W., on the evening of the 11th inst. The lumber yard and steam factory of Smith, Burke & Co., was totally destroyed, besides a number of adjacent buildings. Loss estimated at \$24,000, upon which there was no insurance.

The Classical Institute of Galena, Ill., together with its contents, was destroyed by fire on the 15th inst. The library was partially saved in a damaged condition. Loss \$14,000. Insured \$6,000.

At 2 o'clock on the morning of the 15th inst., a fire broke out on board the steamer Endeavor, lying at her dock in Pittsburgh, Pa., which soon spread to the Gazette, and both boats were burned to the water's edge. There was no freight on board either boat. The Endeavor was partially insured, having \$1,400 in the Pennsylvania Co., at Harrisburg; \$2,000 in the Quaker City Co., also in Harrisburg; and \$1,500 in the Great Western, at Philadelphia. The Gazette had but \$1,500 insurance on her.

A TRAIN of the Cleveland and Pittsburgh road ran into a train of the Pittsburgh, Fort Wayne and Chicago road, while standing at Rochester, Penn., on the 15th inst., taking in wood, and injuring the following persons:—Phras Kaufman, of Lancaster, Pa., and Mrs. T. B. McKean, seriously; Josiah Steward, of Clarksville, Pa.; C. L. Warner, of Salem; Frank Grebe, of Sheboygan; W. A. Benton, of Chicago; T. H. D. Blake and Edward D. Porter, of Boston; D. M. Cook of Mansfield, slightly. A number of others also received bruises whose names are not known.

KILLED BY A PAIR OF SHEEP SHEARS.—According to the Chenango Telegraph, a man named Reuben Orr, who lived in the town of Otsego, met his death on Wednesday last under the following circumstances:—He was employed in shearing sheep for Mr. Thomas Havens, and was alone in the barn at some distance from the house. He had a sheep upon a low table, and was working at the animal, when it kicked against the handle of the shears, driving one blade into Orr's leg above the knee, and completely severing the large artery. He at once started for the house, the blood flowing from wound in a great stream, and as soon as possible after he reached it, Mr. Havens bound the limb tightly with a cord. This stopped the flow of blood—it had been running freely about fifteen minutes—and an express was sent off for Dr. Day and other physicians. When the doctor arrived, he found Orr failing very fast from the great loss of blood before the limb was bound, and although every effort was made to revive him, he died in less than three hours after the accident.

News Paragraphs.

THE COMMENCEMENT EXERCISES of Elmira Female College will take place on Wednesday next, June 29th. Oration by Rev. Joseph Cross, D. D., of Charleston, S. C.

THE ROCHESTER THEOLOGICAL SEMINARY, and the University of Rochester, announce that their Anniversary and Commencement Exercises will take place from the 10th to the 14th of July. We shall endeavor to give the programme of each in our next.

THE DAVENPORT (Iowa) Democrat says that an official letter from Kossuth to a Hungarian exile at that place has been received, requesting him to take immediate steps towards embarking for Hungary. From the tenor of the letter it would appear that Kossuth was engaged in raising an army.

UNDER the late assessment for taxation in the State of Indiana, the valuations have risen from about \$400,000,000 to between \$600,000,000 and \$700,000,000. This, under the present rates of taxation, will produce a large revenue. The assessments prior to this last, were made seven years ago. The increase has been much greater than was anticipated.

THE reports from the mayor towns of Rensselaer county, indicate that more and serious troubles will follow attempts to collect back rents by selling property under execution.

THE Louisville Journal says that on Monday evening a terrific descent of gnats was made on that city. Places of amusement were rendered unbearable. Gnats were showered on the hotel tables till the lights in the chandeliers had to be extinguished. Eyes, ears and mouths, were exposed to the annoyance.

DATES from British Columbia are to May 14th. The amount of gold shipped from Fraser's River from April 11th to May 10th was \$195,000. The number of men at the mines was rated from 2,000 to 3,000. The accounts of the yield of gold were conflicting. An attempt has been made to fit out an exploring expedition to Queen Charlotte's Island.

THIRTY-THREE stars must be on the National Flag from and after the 4th of July next. This is in compliance with the act of Congress passed April, 1843, which declares that, on the admission of every new State, one star shall be added, and that each addition shall take place on the 4th of July next succeeding such admission.

THE Supreme Court of California, in a case before a citizen of that State and a Chinese Benevolent Company, has decided that idol worship is not forbidden by the Constitution.

THE KANSAS GOLD MINES.—Mr. Swinburn arrived at New York on the 14th inst., from Leavenworth, with \$6000 worth of gold from Pike's Peak. He says a much larger amount might have been got, but the miners were asking \$20 per ounce, which purchasers thought too high. The Leavenworth Times says the accounts from the mines continue encouraging. Claims which four weeks ago were considered worthless, are now commanding from \$5,000 to \$20,000. The snow had disappeared from the mountains, and prospecting was rigorously conducted. New rich leads were being constantly discovered. At Gregory's diggings miners were making from \$65 to \$100 each per day. Arrivals of emigrants from the States continue large, and all rush immediately for the mountains. The health of the mining region was excellent, and the spirit of the miners good.

EFFECT OF WAR ON HUMAN STATURE.—Doctor Bell says that if the curse of war be long entailed on a nation, the physical energies of the people may suffer, by the loss of its finest population, to such a degree that the succeeding generation will fall short of its former standard stature, as was the case with the French youth drafted for the army after the general peace. Thus, in 1826, out of one million thirty-three thousand four hundred and twenty-two young men drafted to serve in the army, three hundred and eighty thousand two hundred and thirteen were sent back because they fell short of even the diminutive stature of four feet ten inches French.

LOMBER TRADE OF MILWAUKEE.—The schooner M. S. Scott, of Milwaukee, Capt. N. H. Blend, cleared from that port, 31st of May, for Cowes and a market, with a cargo of assorted timber, about 170,000 feet, the product of Wisconsin and Michigan forests. This is the first venture of the kind from Milwaukee to the Old World. The vessel's probable destination is Hamburg, and some of the German brewers in Milwaukee shipped by her some kegs of Lager, to show the good people across the water what Milwaukee can do in that line.

DEATH OF A DISTINGUISHED INVENTOR.—Among our recent notices of deaths, says the N. Y. Tribune, we find that of Walter Hunt, aged 63. For more than forty years he has been known as an experimenter in the arts. Whether in mechanical movements, chemistry, electricity, or metallic compositions, he was always at home; and probably in all he has tried more experiments than any other inventor. He originated the sewing machine, spinning flax machinery, the first nail machine, the first machine for cutting brads by one operation, placing plugs in leather for soles of boots and shoes, a method of constructing docks by concrete, preparing a paper pulp so as to form boxes by one operation, the vapor baths, the ball known as the Minnie ball for the rifle, and many improvements in fire arms, printing by rollers instead of balls, and so many other things our space will not admit of details. Walter Hunt, like most inventors, devoted his life to his friends rather than to himself; was liberal to a fault, and none knew him but to love him; he struggled with that monster, the dollar, all his life, in hopes of mastering; yet his numberless experiments kept him always poor.

LAND SALES IN IOWA.—The quantity of land embraced in the President's Proclamation No. 640, amounts to 1,609,601 acres, to be offered as follows:

At Fort Dodge, on 28th September next..... 550,233
At Fort Dodge, on 10th October next..... 334,602
At Sioux City, on 24 October..... 884,466

This land lies on the head waters of the Des Moines and its tributaries, and is represented to the General Land Office as excellent farming land, well timbered, and well provided with water.

THE MORMONS ORGANIZING FOR RESISTANCE.—The late news from Utah represents that the Mormons are organizing military companies and arranging plans for resisting the federal authorities. Gov. Cumming, on receiving reliable information of these facts, issued a proclamation, commanding all such bodies to disperse and return to their usual vocations, on pain of being arrested and punished as disturbers of the public peace. The execution of this order was entrusted by the Governor to the Marshal appointed by the Mormon Legislature, and to this the Valley Tan—the organ of the Gentiles in Utah—strongly objects, as having a tendency to defeat and make of no avail the command of the Executive. Serious troubles are still apprehended, from the insubordination of the Mormons to the United States authorities.

FROM BUENOS AIRES.—By the arrival of the ship Parana at New York, we have papers from Buenos Ayres to April 29th. War had not yet been commenced between Urquiza and Buenos Ayres, and the probabilities were that actual hostilities would be postponed for a while. Urquiza's appeals for assistance to Lopez, of Paraguay, and Parreira, of Montevideo, had been unsuccessful. The government and people of Buenos Ayres appeared convinced that there would be no actual war for the present. The season was too far advanced, and winter was approaching. The Pampas were without grass for horses, and an army could not subsist on supplies from the provinces.

FROM MEXICO.—Late and important news from Mexico is to hand. Miramon is reported to have suppressed a pronunciamento by the priests in favor of Zuloaga, at the capital on the 23d ult. The Church tried Miramon, but the Padres were arrested and sent to Vera Cruz. The Liberals were encouraged. Murzar's expedition against Morilla had been driven back, but not until the town had been ravaged and the women stripped naked and whipped in the effort to make them point out the hidden treasure. The American and other foreigners suffered much loss. Miramon had decreed the importations of Vera Cruz confiscated, and modified the advalorem duties. Mr. McLane was at Vera Cruz on the 30th. Miramon is reported to have been at Jalapa with 350 men. Our despatch is not clear on this point. Senor Bonilla issued a decree on the 25th, in which he says Mr. Buchanan's recognition of the Juarez government is not responsible, and that Americans are not accountable for his acts. Consul Black was reported to be going to Vera Cruz for safety from the rabble of the army. Gen. Cobas is reported at Oajaca, and private parties advise people not to cross the isthmus of Tehuantepec. Zuloaga is reported to have been imprisoned by Miramon.

FOREIGN NEWS.

From the Seat of War.

THE latest intelligence from the contending parties over the water, would seem to indicate that fighting in "good earnest" is to be the rule hereafter. The steamer Europa arrived on the 14th, and by her we learn that the Austrians were twice defeated in their attempt to retake Palestro. The King of Sardinia commanded the 4th division in person, and Gen. Cialdini at the head-quarters of the regiment. The Zouaves resisted the attack for a considerable time, and then, having very successfully assumed the offensive, pursued the enemy, taking 1,000 prisoners, and capturing eight cannons, five by the Zouaves. Some 500 Austrians were drowned in the canal during the fight. Another fight occurred at Confienza, in the presence of Somelina, in which the enemy were repulsed by division 40, after two hours' conflict.

The arrival of the Anglo Saxon, on the 18th inst., confirmed the reports brought by the Europa, and startled all with the announcement that a terrific battle had been fought near Milan, in which the French claim a decisive victory. The loss of the Austrians is placed at 20,000—that of the French, 12,000. The forces engaged are reported at 150,000 to 180,000 Austrians, and 100,000 to 180,000 French.

The following is the announcement of the battle, by telegraph from Napoleon to the Empress:

NOVANA, June 4—11 30 P. M.—A great victory has been won at the bridge of Magenta. Five thousand prisoners have been taken. Fifteen thousand of the enemy are killed or wounded. The details will be dispatched by telegraph.

On the following day (Monday) the Moniteur published the following dispatches from the Emperor to the Empress:

MAGENTA, June 5.—Yesterday our army was under orders to march to Milan, across the bridges thrown over the Ticino, at Turbidge. The operation was well executed, although the enemy, who had repassed the Ticino in great force, offered a most determined resistance. The roadway was narrow, and during two hours the Imperial Guard sustained, unsupported, the shock of the enemy. In the meantime, Gen. McMahon made himself master of Magenta. After sanguinary conflicts, we repulsed the enemy at every point, with a loss on our side of about 3,000 men. The Austrians taken prisoners are at least 7,000, and the Austrians placed hors du combat are 20,000. Three pieces of cannon and two flags were captured from the enemy. To-day our army rests for the purpose of re-organizing itself.

Milan is insurgent. The Austrians have evacuated the town and castle, leaving in their precipitance the cannon and treasure of the army behind them. We are encumbered with prisoners, and have taken 13,000 Austrian muskets.

A despatch from Paris, Monday night, to the London Post, says, the municipality of Milan claims for Victor Emanuel, King of Sardinia, and has presented an address to him in the presence of the Emperor. To-morrow the King will make his entry into Milan.

The following are the Austrian accounts by way of Vienna. The information is meager and unsatisfactory:

VIENNA, Monday, June 6—11 30 A. M.—A desperate combat took place on Saturday between the 1st and 3d (Count Glams' and Prince Liechtenstein's) corps d'armee and the enemy, who had passed the Ticino in considerable force. The result of the contest was undecided. The combat was continued on Sunday.

Our troops threw themselves upon the enemy's ranks with ardor, and showed a valor and perseverance worthy of the most glorious feats of arms of the Imperial Army. Milan is perfectly tranquil. The headquarters yesterday were still in Abbiate Grasso.

An Austrian telegram from Verona gives a similar view, but adds that the authorities and weak garrison of Milan, with the exception of the castle garrison, have withdrawn at the command of Gen. Gyulai. The town is quiet.

GREAT BRITAIN.—The Queen of England had delivered her speech to Parliament. The document possesses no important points.

A motion of want of confidence in the Ministry was pending in the House of Commons.

It was stated that the prospectus of a company would be issued in a few days for laying two telegraph cables from Cornwall, England, to Canada direct, and that the proposed capital of the company was \$500,000.

A great explosion of saltpetre occurred on the troopship Eastern Monarch, from Kurrachel, while at anchor at Spithead. She had 600 soldiers and their wives on board, returning from India. The ship was speedily enveloped in flames, but prompt action saved all but seven persons, including five children, who were killed.

FRANCE.—The Moniteur publishes the official notification of the blockade of Venice.

The recall of the French soldiers on leave of absence had added 120,000 veteran soldiers to the French army.

The Paris Debats had a letter from Rome stating that Piedmont has recognized the neutrality of the Pontifical States on certain conditions.

TURKEY.—The garrison of Belgrade has been reinforced, and it was reported that it would be trebled. It was also said that the Porte was about to send a strong naval force to the Adriatic. The Hertz Govina was reported to be in open revolt, and the latest intelligence says the whole of European Turkey was bordering on revolution.

GERMANY.—The feeling in some of the States of Germany against the French is so strong, that a French manufacturer at Hesse Cassel, employing 700 workmen, has been compelled to quit the place on account of the excitement.

PRUSSIA.—The terms of the new loan are announced. It bears five per cent. interest, and is to be issued by public subscription—the redemption to commence in 1860, by the payment of one per cent. annually—30,000,000 thalers is the amount.

At the grave of Humboldt, the United States were represented not only by our Minister at Berlin, but by a representative from each State of the Union, gathered for that purpose at Berlin from different parts of the Continent.

The News Condenser.

- Mexico is in another state of commotion.
- It is said 4,000,000 of the people of France eat no bread.
- The Washington papers advertise building homes for sale.
- Vancouver's Island gold mines are now attracting adventurers.
- The population of the city and suburbs of Nashville is near 35,000.
- A child was baptized on a train of cars in Wisconsin the other day.
- Butter has been selling at ten cents per pound in Davenport, Iowa.
- African slave trade meetings have been commenced in Georgia.
- Heavy rains on Turk's Island have destroyed much of the salt on hand.
- The Moniteur publishes the official notification of the blockade of Venice.
- The Government of Naples, it is said, has prohibited the export of sulphur.
- Some progress was made last Sunday in New York in closing the dram shops.
- The middle classes of England are forming rifle clubs all over the kingdom.
- Priores won the Queen's plate of 100 sovereigns at Epsom races. Six horses ran.
- New Jersey ranks the fifth State in the Union, in point of manufacturing industry.
- The women of Blissfield, Mich., have organized a lodge of the Daughters of Malia.
- Four hundred likely African negroes have been landed on the coast of Texas lately.
- Ralph S. Hart, a St. Louis lawyer, has won a case in which his fees amount to \$110,000.
- Under the head of "cholera," the Boston Post notices the sale of a dozen cucumbers.
- A savings bank in Litchfield Co., Conn., reports among its assets, "three dozen scythes."
- At the date of our latest advices, strawberries were worth \$2.50 per pound in San Francisco.
- Col. Sam. Colt, of Hartford, has a 75 pound silver nugget, received from the Arizona mines.
- The French Engineers are said to have recommended the fortifications at Civita Vecchia.
- Our Mediterranean Squadron is to be increased to protect American commerce during the war.
- Horace Greeley thinks the child is now born that will see Illinois a State of ten million people.
- Several small lots of peaches have already arrived in New York from Charleston and Savannah.
- The New York police have been forbidden to interfere with politics, under penalty of dismissal.
- The Grand Jury of Alachua Co., Fla., have presented Gov. Perry, of that State, as a "nuisance."
- Parisian donnets are gradually coming over the face, particularly over the middle of the forehead.
- Gen. Walker, of Central American notoriety, has very suddenly and unexpectedly arrived in New York.
- The P. O. Department has a proposition to carry the mails from New York to New Orleans in four days time.
- Flat-bottomed boats were being constructed in France for the navigation of the Po, Ticino, and other rivers.
- Ginseng, about which there is an excitement raging at the West, has been sold to the Chinese at a dollar a pound.
- The editor of the Vicksburg (Miss.) Whig has seen a stalk of corn, of this year's growth, over eleven feet high.
- The San Francisco Evening Bulletin has been fined \$200 for publishing Teresa Sclies' confession. Charge, obscenity.
- Complaint is made of a long protracted drought in certain districts of Mississippi, Georgia, Texas, and Louisiana.
- The America, on her last trip, took out 67 passengers for Liverpool and \$410,000 specie. Prof. Agassiz was a passenger.
- Yeh, the late Imperial Commissioner at Canton, has died in India, where he was a prisoner in the hands of the English.
- The lady who started the first Sabbath School in Boston, in 1811, is now living in Medford, Mass., at the age of seventy.
- Two public drinking fountains have been erected in New York. They are much used, and but very little water is wasted.
- The Turkish Pashas in Syria are reported to have commenced bitter persecutions against the native Protestant Christians.
- Mr. George Loring, the Grand Master of Odd Fellows, in England, has absconded with twenty thousand dollars of the funds.
- An official daily paper in the French language, *Le Moniteur Ottoman*, is about to be published by the Turkish government.
- Pike's Peak news, now revived in all its glory, should be received with great caution for the present. It wants confirmation.
- There are 15 daily papers, 8 semi-weekly, eleven semi-monthly, 39 monthly, and 103 weekly, printed in the city of New York.
- The people of Newburyport, Mass., are talking about reducing the number of school hours, and having but one session a day.
- A novel procession of "old folks" is proposed at Clinton, Ont. Co., on the 4th of July. None to appear in the ranks if under 70.
- The immense military preparations which England is making, show that the government has little hope of preserving its neutrality.
- In North Carolina they have no penitentiary. Whipping and branding, the stocks and the pillory, are among their punishments.
- There is said to be not less than 10,000 Chinamen on their passage to California, where they will be likely cause trouble among the miners.
- It is said that the French Government has contracted for 20,000 tons of American coal for their steamers, to be delivered at Marseilles.
- The Paris Debats has a letter from Rome stating that Piedmont has recognized the neutrality of the Pontifical States on certain conditions.
- The new Prussian marriage law has abolished no less than eight pre-existing grounds of divorce! There are more still left than there ought to be.
- Hon. John C. Richardson, one of the Judges of the Supreme Court of Missouri, has resigned his office on account of the inadequacy of his salary.
- A mail manufacturing company in Cincinnati will take a tree in the field, and in four days have it made into matches and distributed to customers.

ASPIRATION AND GROWTH.

BY GEO. A. HAMILTON.

ALONE in the busy world of thought,
I moved with aspirations high—
I would be pure, and true, and good,
And would the ending world defy—
I'd range among the noblest things,
Would give to thought its purest way,
The bright to-morrow should perform
Some greater action than to-day—
Whatever deeds are true and pure,
All noble things of good report,
Whatever likens mortals here
To Him who rules the heavenly court—
These I'd pursue with ardent heart,
With earnest and unwavering will,
Nor cease the struggle, long, severe,
Until my bounding heart was still.

But stay, my soul, wait not for scenes
Of greatness, or for world-wide fame,
Life's little acts in kindness wrought
Shall glow with purest, fairest flame.
To cheer a child, to help a friend,
To make a spot of earth look bright,
To turn depending ones to Him
Whose love brings always sweet delight,
That everywhere I go or stay,
An influence for the right shall flow,
Till every friend, companion, all,
Shall find their hearts more tender grow.
Ah, this is earnest life and growth,
And this more like the SAVIOR'S love,
More like the way that heaven approves,
And more like angel-life above.

South Butler, N. Y., 1859.

GLEANINGS.—NO. VI.

BY WINNIE WILLIAM.

"The inconsolable widow of Deacon BERRY,
Don't intend to get married again."

The good JOSEPH HUBBELL was dead at last; and after all due preparations had been made, the accustomed quantity of tears shed over the lifeless clay, they bore the coffin from the little "front-room," out into the sunshine, through the green meadows to the church-yard. "Dust to dust, ashes to ashes,"—the yawning pit received its victim, the damp earth was heaped above his breast, and they left him to his slumbers until the sounding of the tramp. People wondered that he had lived so long, but his wife said that he was "one of those men that would never give up if he could help it," so for many long months he had struggled against a legion of diseases, but one smiling June morning Death triumphed, and PEACABLE HUBBELL was a widow.

In the evening the neighbors assembled together at the house of a noted gossip to "talk over" the funeral.

"Did you ever see any one 'take on' as she did?" queried Miss CLESTIA ANN BROWN, an amiable spinster, somewhere on the shady side of forty. "I shouldn't have thought she could have had the face to have carried on so, for both you and I know, Mrs. DIBBLE, that she did not lead him a very peaceable life. I do suppose she grumbled every step she took for him while he was lying there, not able to turn himself in his bed."

Mrs. DIBBLE puckered up her mouth—a very disagreeable looking mouth, by the way. "Indeed, my dearest CLESTIA, you know what I have always told you. Now, between you and me,"—shaking her head and elevating her forefinger—"between you and me, JOSEPH HUBBELL died before his time, though the land knows he was an awful while about it. Such long sicknesses make one so much work, don't they? But as I was saying, if he had married a different woman, such as you, CLESTIA, no doubt he would have lived to a ripe old age." Here Mrs. DIBBLE wiped her eyes, and CLESTIA ANN affected a blush.

"Poor woman! how sorry I feel for her," said a girlish-looking creature. "How dreadful it must be to be a widow," and the young wife drew closer to her husband.

"She's well provided for, any way, and that's a good thing," said Grandma GAZEM. "No one knows unless they have tried it, how hard it is to be left a widow, poor, and with a family of children to bring up. I've been through the mill, and I know all about it."

"I suppose the place is paid for," suggested Deacon DODD.

"Oh, yes, yes! I suppose so," said Grandma; "and then you know she has no children, and I think she ought to be thankful she's so well off."

"No doubt she has cause for thanksgiving," responded a would-be wag. "Left a widow at the age of forty—no children, and the place paid for—certainly, Mrs. PEACABLE HUBBELL should be a happy woman, eh, Deacon?" The Deacon answered not, but there was an unusual light in his watery blue eyes; an idea had disturbed the wonted serenity of his peaceful cranium. Deacon DODD was a widower, the happy father of six about as red-headed children as ever were seen. A very nice man was the Deacon—at least everybody said so—middle aged, of a respectable size, and denominated one of the "pillars" of the village church; although he was not burdened with a superabundance of this world's goods. However, he was very kindly regarded by manna who had marriageable daughters, and young ladies who had a horror of spending their lives in single blessedness, while the young DODDS, being continually dosed with sugar-plums and sweet-meats, were generally in an exceedingly dilapidated state of health, thus causing their dear papa many hours of sleepless anxiety.
